ANNOUNCEMENT OF POSITION VACANCY

Ball State University
Muncie, Indiana
Director, Center for Information
and Communication Science

Ball State University invites applications and nominations for the position of Director, Center for Information and Communication Science available July 1, 1985. The Director reports directly to the Provost and Vice President for Academic Affairs and directs all aspects of the operation of the Center for Information and Communication Sciences, including the academic programs, research and service activities, production, and faculty development connected to the Center.

Qualifications: baccalaureate degree from an accredited institution; a combination of post-baccalaureate education, media experience, knowledge of computer applications and of information and communication science technology; connections with external funding sources; demonstrated abilities to communicate; higher education experience, and administrative experience that will enable the individual to provide leadership and vision for the diverse activities of the Center.

Applications, current Vita and the names, addresses, and telephone numbers of at least three references should be addressed to: Center Director Search, Office of the Provost, AD-105, Ball State University, Muncie, IN 47306, phone (317)285-1333. The position is open until filled; however, review of credentials will begin on December 15, 1984.

Ball State University Practices Equal Opportunity in Education and Employment.

MVS
SYSTEMS PROGRAMMER
UP TO $40K

Become an integral member of our new IBM 4381 MVS/XA/CICS technical support team. 1985 represents a quarter of a century of continued expansion in sales, profits and most important: PEOPLE. We are a Fortune 500 Company in a desirable low cost of living metropolitan Sunbelt location. We offer a full range of benefits, training, and career growth. You probably won't qualify for our top salary to start, but you'll have the opportunity to earn it. Apply in confidence with your resume and salary history (and forget having to pay state income tax).

Sales

MANUFACTURING AUTOMATION SALES

An experienced, self-motivated sales person is currently needed at our corporate offices in Ann Arbor to sell computer-related project management services to the S. E. Michigan industrial automation market. Sales responsibilities will include client identification and development, proposal definitions, development of sales presentation, client negotiations, and ongoing client follow up during work execution.

Software Services Corporation has been delivering project management and consultant services to the computer industry since 1976. Our annual growth rate of over 30 percent in the past three years has been the direct result of successful work and satisfied clients.

Qualified applicants for this position will have the following general profile: • Five to ten years of computer sales experience. • Knowledge of the manufacturing automation industry in S. E. Michigan. • Familiarity or experience in the application of computers and systems to such manufacturing applications as production scheduling, inventory planning and control, shop floor control, machining and testing, robotics, flexible manufacturing systems, CAD/CAM, and/or interplant communications networking. • Ability to develop and present highly professional sales support material such as brochures and trade show materials. • Proven ability to develop and close business to meet established sales quotas.

The successful applicant will be offered an outstanding compensation plan, competitive fringe benefits, and the opportunity to perform a significant role in our corporate growth plan.

To apply, please send a copy of your resume to Mr. O. Lundin at the address below. All replies will be kept confidential.

Whether it's discovering ways to squeeze the most oil from shale deposits or creating information systems to streamline business operations, Southern California Gas Company is seeking better ways to optimize the use of energy it distributes to more than 13 million people.

We're currently looking for someone to provide computer programming support to develop and maintain computer systems which produce gas balances, cost of gas forecasts, and revenue forecasts used in the preparation of rate cases, financial plans, and cash flow forecasts.

If you have a degree in Information Systems, Mathematics, or Engineering with an emphasis in programming and/or a degree in Business Administration or Economics with special focus on Statistics, and you have 2-3 years of related work experience, you're the candidate we seek.

Fluency in COBOL is essential and FORTRAN is a plus. Experience with Forecasting/modeling, IBM Hardware and TSO/CICS is also an asset.

This position requires good communication skills, including the ability to communicate technical information in writing to non-technical users. U.S. Citizenship or permanent resident visa required.

Please submit your resume and salary history in confidence to:

Equal Opportunity Employer M/F

COMMUNICATIONS ANALYST

Valmont Industries, Inc., the world's leading manufacturer of center pivot irrigation equipment, also produces and markets lighting standards, transmission structures, tubing, financial services, insurance and a newly-formed computer services business. Our 1983 sales were 194 million. Our company is growing with opportunities for results-oriented professionals.

Reporting to the Vice President-Management Services, this position has accountability for the planning and support activities of voice and data communications for the company and off-site subsidiaries. This involves selection of communications hardware/software, data communications services, modems, network management facilities, and PBX equipment. Will play a key role in preparation of an integrated voice/data office support system for the Company.

We offer competitive salary and benefits, "including relocation to an area offering a variety of lifestyles - city, suburban, rural and lake-side", modern facilities, plus an opportunity to make an independent contribution in a growing organization.

If you have had at least 3 years practical experience in voice and data communications, demonstrate a strong knowledge of communications hardware and software, plus enjoy the challenge of a changing, dynamic environment, we want to hear from you. Please respond by December 10, 1984 to: V. Braun, Refer to Job PLC-365 via CW.

Developing the world's most advanced systems software requires exceptional talent.

For 25 years, Applied Data Research has been the "driving force" in software development. Many of the innovations we introduced years ago are now considered industry standards. Many of the software systems we are developing today will no doubt become the standards of tomorrow.

Currently, ADR software development professionals in Princeton, NJ and Dallas, TX are taking an innovative look at 4th generation systems software for IBM mainframe and personal/micro computer technologies. Individuals interested in associating themselves with this "world-class" development effort should be experienced in any of the following areas:

SYSTEMS SOFTWARE DEVELOPMENT

-4th Generation Languages
-Data Base Management Systems
-Word Processing/Electronic Mail
-Performance Measurement/Capacity Planning
-PC/Mainframe Communications
-Operating System Extensions

TECHNICAL SUPPORT SERVICES

-Data Base Administrators and Consultants
-MVS/DOS/VM Technical Support
-Systems Programmers (MVS/VTAM/NCP)
-Systems Analysts/Programmers (DB/DC)
-Human Factors

Applied Data Research offers an excellent program for professional development, relocation assistance, and a compensation package which is fully commensurate with your education, experience and potential. For immediate consideration forward your resume or call Mr. Gary Johnson, (201) 874-9000, **APPLIED DATA RESEARCH, INC., Route 206 & Orchard Road, CN-8, Princeton, NJ 08540.**

What do you get when you combine Georgia hospitality with TRW technology?

The state-of-the-art is a more relaxed state of mind.

The brand new TRW Defense Systems Group Warner Robins Engineering facility at the heart of the peachtree state of Georgia is one of the most sophisticated research and development centers to be found anywhere north, south, east or west. But it's the southern hospitality you'll find in Warner Robins' friendly community that makes it so ideal for you and your family. For instance, you'll still find affordable housing, good schools, and a variety of recreation programs available. Sparkling beaches and majestic mountains are within easy reach of any weekend. And, if that's not enough to delight you, TRW's leading edge challenges surely will.

ELECTRONIC WARFARE/AVIONICS SYSTEMS

We're at the forefront of the research, design and development of embedded computer systems for airborne applications and associated ground based support systems. Deeply involved with advanced hardware and software systems engineering for airborne radar, ECM, ECCM, radar warning-receivers, and avionic test and support systems. Our ultra-modern facilities offer individual offices with your own computer work station.

Consider your opportunities in any of the following areas:

EW SYSTEMS

Positions require a BSEE or equivalent and experience in one of the following: threat analysis, design analysis and test, ECM Technique Measurement, System Design, RWR and ECM systems, Hardware/Software integration, requirements development/analysis.

MODELING AND SIMULATION

Positions require a BSEE or equivalent and FORTRAN development experience in one of the following: radar simulation, EW system simulation, ECM system simulation, RWR system simulation.

REAL TIME SOFTWARE DEVEOPMENT

Positions require a BS in EE, Physics, Math or C.S. and Assembly/JOVIAL/FORTRAN experience in one of the following: executive structure, hardware/software interface, signal processing, algorithm development, diagnostics fault isolation.

SOFTWARE DEVELOPMENT

Positions require a BS in EE, Math or C.S. and experience in one of the following: information management systems, data reduction and analysis, processor simulation/emulations.

SOFTWARE TEST

Positions require a BS in EE, Physics, Math or C.S. and experience in one of the following: performance analysis, software V&V, hardware/software interface, real time software.

TRW offers excellent salaries and an outstanding flexible benefits plan which includes vision and dental care. Relocation assistance is available. For immediate consideration, call COLLECT or send your resume in confidence to:

Perform analysis of current business procedure and operational problems, refine and convert data to programmable form for statistical modeling and computer simulation studies, conduct hypothesis testing to insure adequacy of data and operational model, work with EDP staff to design and develop accounting and financial application software based on operations research. M.B.A. with course work in managerial accounting, finance and quantitative methods. Must also possess one year in job offered or one year of experience in computer programming/application of quantitative methodologies, demonstrated ability in use of statistical modeling and computer simulation for development of accounting and financial application software, thorough working knowledge of micro computer systems and BASIC, FORTRAN and COBOL languages. CONTACT: LA OFFICE OF EMPLOYMENT SECURITY, 1801 Auburn Avenue, Monroe, Louisiana 71207.

Programmer/Analyst

Programmer/Analyst needed to design, analyze and install revenue accounting and financial accounting systems. Prepare flowcharts for accounting systems. Code, test and implement accounting systems utilizing VM/CMS, CICS (Command Level), VSAM and COBOL. Coordinate utilization and implementation of accounting systems with user management. Requires Bachelors in Finance or Business Administration and two years experience in job offered or will consider Masters Degree in Business/Data Processing or its equivalent in lieu of experience. Must have knowledge of accounting, programming systems, CICS and COBOL. Forty hour work week. $22,000 per year. Apply at the Texas Employment Commission, Dallas, Texas or send resume to the Texas Employment Commission, TEC Building, Austin, Texas 78778. Job order # [illegible]. Ad paid by an Equal Employment Opportunity Employer.

HAVE YOU EVALUATED YOUR CAREER LATELY?

Are you looking for more challenge... greater recognition opportunity... a leading edge systems environment... competitive compensation?

Bank of Boston, New England's innovative leader in the financial community, is looking for you. We are seeking top flight, top 10% achievers in:

- **Systems Development**
  Where a structured programming and analysis and project management approach is the foundation for Programmer/Analyst and Systems/Analyst careers in Banking, Accounting, and Treasury applications development and maintenance working with IBM 3081, 3033, MVS, TSO/SPF, IDMS with ADS-O, FOCUS, DEC VAX, COBOL, PL/1, Assembler.
- **Project Management**
  Where your experience in an IBM, MVS mainframe environment including PCs, Decision Support Systems and Banking applications development can qualify you for a Project Manager or Senior Trouble Shooting role in Retail Banking or Treasury systems.
- **Strategic Planning**
  Where TSO, LOTUS 1-2-3, SAS, STRATEGEM, Megacalc and multi-language skills are used to develop and maintain corporate strategic modeling, forecasting and Asset/Liability Management Systems.

Bank of Boston offers the comprehensive benefits program you deserve. Join us now while we develop major new projects in an expanding industry—changes that require the best minds in EDP. If you are that top 10% individual, and you seek real challenge and career flexibility, write to Thomas Matson, Bank of Boston, P.O. Box 1976-ER, Boston, MA 02105.

Go Direct. You can access Bank of Boston's on-line Career Network through your own PC or terminal. Dial 617-275-4112, press Return, key in the password "BOBOS" and press Return again. Your call is completely confidential.

Your Strategic Career Choice

Does your career need a strategic boost? If so, you should consider Dartmouth's professional program in the design and management of information systems.

Our two-year Master's program is designed to equip tomorrow's information systems managers to play a leading role in the design and development of effective business solutions to business problems. We offer a blend of technological, management, and communication skills, and a record of career advancement.

Students in Dartmouth's CIS Program spend one term as interns in a variety of sponsoring organizations. On campus, they study the broad fundamentals of information systems, networks and distributed processing, current analysis and design methodologies, database management systems, communication and management skills crucial to effective planning and implementation, and the social, ethical, and organizational issues related to information systems. Case studies and guest lectures by practicing managers of information systems and professionals in residence are regularly featured.

If you have previous experience in the computing field but want to be equipped to assume more responsibility and leadership, why don't you consider joining us next year? For more information, write:

THE RANDOLPH STORY... SINCE 1965.

Randolph, the most innovative and the most financially stable computer lease-financing company of the 1960's, had its beginning in 1965, when Randolph Computer Corporation was formed to lease IBM's newly-announced S/360 computers.

The company's initial bankroll—over $18.0 million—was a hefty sum back in 1965, although it would be considered only petty cash in respect to Randolph's current daily leasing activities. But it was a start—and a good one.

OFF AND RUNNING. Randolph quickly established a reputation for leadership in the computer leasing industry. Just four years later, in 1969, The Travelers Insurance Corporation acquired all outstanding Randolph common stock. The company continued to grow, to add new customers for S/360's and peripherals. By 1972 Randolph's portfolio included over $180 million of computer hardware.

ENTER . . . THE BANK OF BOSTON. Then, in late 1972, the Bank of Boston purchased Randolph's S/360 assets through a subsidiary, Firstbank Financial Corporation, to become the first bank in the United States to enter the business of leasing and financing computers. The Bank administers these assets through Randolph, which is still staffed essentially by the same team of professionals who have an average of 18 years experience in the computer leasing and data processing industries.

LEADING THE INDUSTRY. Today Randolph provides lease-financing for IBM systems—CPU's and peripherals. Our customers continue to benefit from the skills of the most seasoned management team in the industry. And Randolph's affiliation with Bank of Boston gives added assurance that they can continue to depend on the company's unique financial stability.

STABILITY YOU CAN BANK ON. The Randolph name and distinctive logo headline all of Randolph's advertising and communications, reminders that the first team in computer leasing will continue to provide high-quality lease-financing for all of IBM's computers and related equipment . . . to live up to the terms and conditions of its agreements . . . provide upgrades . . . and fulfill all of its commitments.

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's
Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Turnkey Systems and Real Estate).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines.

Cost: Our rates are $128.10 per column inch. (A column is 2" wide.) Minimum size is two column inches (2" wide by 2" deep) and costs $256.20 per insertion. Extra space is available in half-inch increments and costs $64.05. Box numbers are $15.00 extra.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE.

Ad size desired:________columns wide by________inches deep.

Issue Date(s):________________________

There's No Time For DOWNTIME!

And that goes for your business as well as your computer system!

So, while the industry works on your system's problems, let us work on your business problems. Advertise in–

COMPUTERWORLD CLASSIFIEDS!

One insertion will let a potential audience of over a half a million readers know what you are looking for or have to offer. Whether you are looking to recruit computer professionals, want to buy, sell or lease equipment, have computer time or services to offer, or software packages to sell, and more, Computerworld Classifieds will help you get a lot of exposure and get things done faster.

The open line rate is $9.15 per line and there is a minimum size of 1 column by 2" at a cost of $256.20. We can accomodate up to 5 columns and depth measurement increases by half inch increments.

Ads may be mailed in, cleanly typewritten, with a letter stating the size desired and the issue in which it is to be run. Our adtakers will take ads that require no extensive artwork or borders over the phone. We also provide telecopier service.

Any borders, logos, or artwork should be sent in with your ad and must be dark and clear enough to be reproduced.

Computerworld comes out every Monday and our deadline for receiving ads is 10 days (or six working days) prior to the issue date desired.

First time advertisers must send either payment or a purchase order along with their first ad.

Our mailing address is:

THE BULLETIN BOARD

A Low-Cost Way to Sell Hardware and Software in Computerworld.

What is The Bulletin Board?

It's a classified section in Computerworld designed especially for the selling and buying of individual pieces of hardware in a convenient, low-cost format. It is especially suited to companies that have a piece of used equipment they want to sell. For one low price, you can inform more than half a million Computerworld readers around the country of your equipment's availability.

How Does The Bulletin Board Work?

Bulletin Board ads come in standard units (one column wide by one inch deep) and standard typefaces. (Units may be combined to produce deeper ads, but one column is the maximum width and no units of less than one inch are available.) Ads are arranged under headings (such as "IBM", "DEC" or "Printers"). The headline of the ad is set in larger, bold type, and should contain the standard equipment identification. The body copy should describe the equipment very briefly and give the person to contact. This is all the information an interested buyer needs to follow up. No ad should have more than one piece of equipment or software.

The price for each standard unit is only $130.00. There is a one unit minimum and no fractional units available.) Anyone can place an ad, but no agency commissions are paid, no quantity discounts allowed, and no credit toward rate is given for contract advertisers who advertise in other sections of Computerworld. It's a simple and effective system for buying and selling hardware and software.

How to Place an Ad in the Bulletin Board.

Ads are accepted in the mail, by phone or by telecopier. Ads can be accepted up until the Monday before issue (7 days in advance of issue date). You should write out your ad before submitting it. (The standard size will hold approximately 25 words of copy.)

Once you've written your ad, send it in with the coupon or call one of our ad-takers. (If your company has never advertised with us before we request a check with your order.)

Remember that all ads are standard. No special typefaces, no borders and no logos are allowed. Ads are set on a six-column page in our classifed section under the heading "The Bulletin Board.". We assume no liability for errors beyond the price of the ad in the case of material errors.

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. (No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

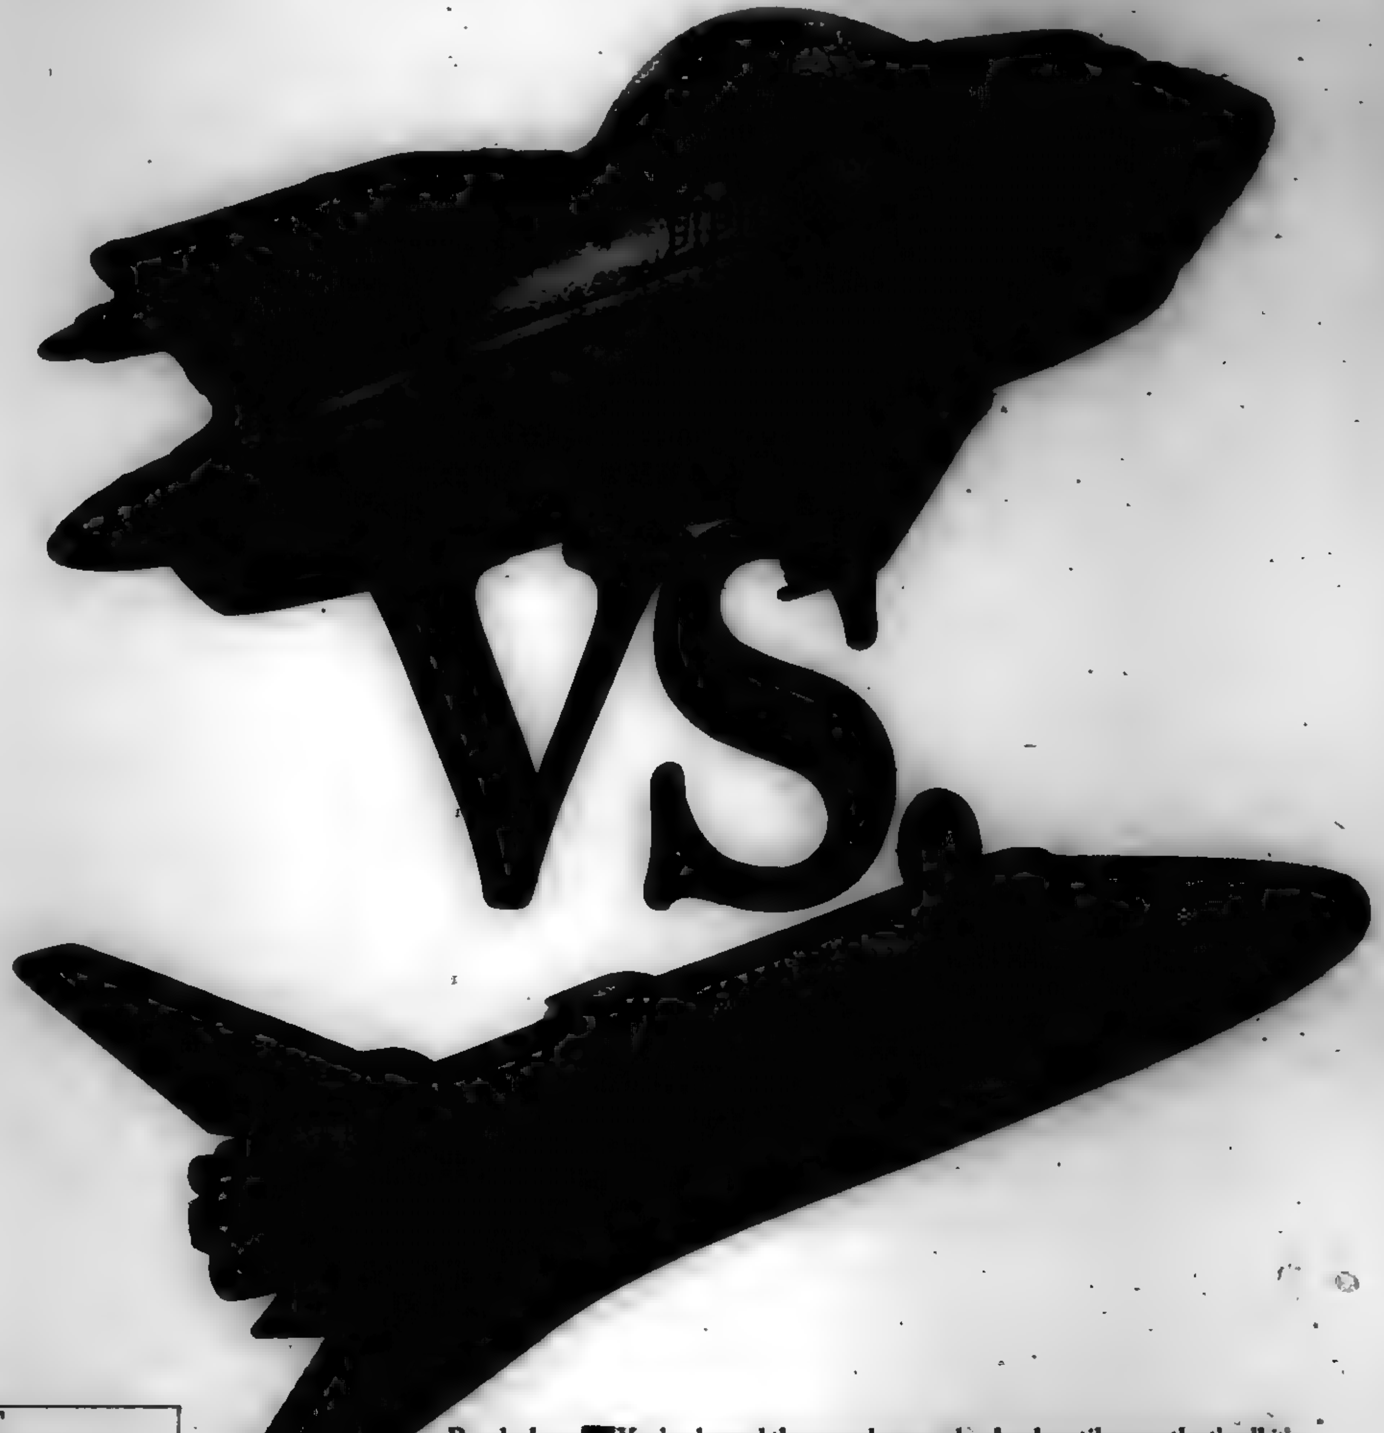
MSA WE ADD THE GENIUS TO COMPUTERS.™

The Software Company



MEET
THE SYSTEM
THAT MAKES
BORDERLESS
FACT.
NOT FANTASY.

INFORMATION
EXPERT™

Borderless. ■ You've heard the word enough. And until now, that's all it's been. A word. Not reality. ■ But Management Science America has changed that for good. ■ Introducing Information Expert™ (I.E.). The new mainframe software tool that gives you the level of system integration that some companies have been promising. But not delivering. ■ I.E. is truly borderless. ■ It removes the barriers between systems. Between the individual user and accounts receivable. And accounts payable. And general ledger. And more. So that the individual user can retrieve information and design reports from several application programs at once, even if they aren't all MSA programs. Simply and quickly. At one online terminal. ■ And I.E. is designed to meet the needs of a broad cross section of users. It's easy enough for first-time users—because commands are in plain English. And powerful enough for the most advanced DP specialist. ■ And I.E. also gives you higher levels of security than most other systems. ■ Only MSA gives you I.E. ■ It's a giant technological step into the future from the company that has quietly led the way in application software development. It will now be a part of all software MSA provides. The result of 3½ years of intense research and development, it's the tool that has taken the concept of total "system integration" out of the realm of theory and into the realm of fact. ■ To find out more about I.E., contact Robert Carpenter at (404) 239-2000. ■ Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326. ■ I.E. from MSA. ■ It's one more way we're adding the genius to computers. ■ Today and tomorrow. ■ ©1984 Management Science America, Inc.

IBM Cabling System falls short of mark, user says

University calls prototype system costly, bulky, considers scrapping campuswide installation

By John Six
CW Staff

PITTSBURGH — An early user of the IBM Cabling System has found the building wiring scheme to be overly space-consuming and expensive — factors that may lead it to abandon plans to use the system in 30 other buildings on its campus.

Carnegie-Mellon University here installed a prototype Cabling System approximately a year and a half ago in a building it was constructing to house its computation center, administrative programming group and information technology center. The last is a joint venture between the university and IBM to develop workstations for educational and research environments.

The four-story structure was wired to Cabling System specifications with cable that IBM donated, said Tom Bajzek, interim director of the computation center. Following the configuration plans, each of the roughly 100 offices in the building was equipped with an outlet that provides separate interfaces for voice and data devices. The outlets are wired in a star topology to wiring closets on each floor, which are, in turn, wired to a central distribution frame in the computer room.

As a prototype, the cable used in Carne-

PARMA, Ohio — To convert, or not to convert: That is the question for David A. Seman, who, as DP director at Parma Community General Hospital here, has been agonizing over whether to migrate to the MVS operating system when his IBM 4381 mainframe is installed in February.

MVS would free up some precious virtual storage on the hospital's 4341 Model Group 2 running on DOS/VSE under VM, but it costs more. Meanwhile, Se-

Prototype net ties Defense systems

By James Connolly
CW Staff

WASHINGTON, D.C. — Five miles of cable running along the walls and through the steam tunnels of the sprawling maze known as the Pentagon are linking U.S. Army office systems produced by seven different vendors.

Army officials hope the prototype, a mongrel local-area network, will set a de facto office communications standard for other Army commands and branches of the U.S. Department of Defense.

"We are looking to provide a totally integrated office system for the headquarters of the Army. We want to provide more accurate communications, to move information faster, to improve the efficiency of mid-level officers and to better process secure, classified materials," said Lt. Col. Patrick C. Lanpher, project manager for the Headquarters Integrated Office System. The network, operational since January, is used for office automation tasks such as handling personnel reports and payroll information.

It links an installed base of minicomputers, superminis and mainframes from Wang Laboratories, Inc.; IBM; Digital Equipment Corp.; Motorola/Four-Phase Systems, Inc.; and Inforex, Inc. to six AT&T Unix-based superminis from DEC, Computer Consoles, Inc. and Perkin-Elmer Corp. installed under the prototype project.

But in addition to connecting normally incompatible systems from varied vendors, the Army brought in two different local-area

IBM, Rolm OK sale of unit

Justice Department approval of IBM's Rolm acquisition contingent on divestiture of Rolm military computer business

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — The Department of Justice last week said it would not oppose the acquisition of Rolm Corp. by IBM, provided that the two companies consent to the divestiture of Rolm's military computer business.

Reacting to a civil antitrust suit brought by the Justice Department and to a proposed settlement of the action filed simultaneously Nov. 20 in U.S. District Court here, IBM and Rolm agreed to the divestiture terms specified by the government.

The Justice Department said it reviewed other aspects of the proposed acquisition announced in September, particularly IBM's acquisition of Rolm's private branch exchange business, and concluded that there was insufficient legal basis for challenging those aspects of the acquisition.

IBM to find buyer for Rolm division

As part of the divestiture settlement, subject to a 60-day public comment period, IBM will have six months to find a buyer for Rolm's Mil-Spec Computer Division, which reportedly accounted for 15% of Rolm's $660 million in revenues last year.

The Department of Justice said the challenge to IBM's $1.26 billion takeover of Rolm, brought about two days before Rolm stockholders were to vote on the takeover issue last Wednesday, was prompted by concern that the acquisition would "substantially lessen competition" in the military specification (mil-spec) commercial market, where the manufacturing and sales "are highly concentrated." Rolm had $75 million in mil-spec sales in 1983, which accounted for 50% of total mil-spec sales, according to the suit.

Meanwhile, Rolm stockholders at the company's annual meeting voted overwhelmingly to approve the takeover by IBM, depsite the Justice Department's consent decree forcing the divestiture. The vote, IBM said, consummated the merger, adding that Rolm is now a wholly owned subsidiary of IBM.

Assistant Attorney General for Antitrust J. Paul McGrath said in a prepared statement that between 1980 and 1983, Rolm and Norden Systems, Inc., a subsidiary of United Technologies Corp. of Hartford, Conn., accounted for 80% of total annual domestic sales of mil-spec computers, which are manufactured to withstand the rugged environments of military use.

The antitrust suit said there were "substantial barriers" to entry in the mil-spec commercial-based market and that IBM "was by far the most significant of, at most, a few potential entrants" into the market. Additionally, Justice Department lawyers, reviewing the proposed acquisition, found IBM "intended to enter this market and to commence taking orders in 1985."

Other reasons cited in the Justice Department suit noted that many of IBM's commercial products are currently used by the military and that its own mil-spec business, while not based on commercially available architectures and software designs, would give it "unique and significant advantages" in the commercial mil-spec market.

Rolm manufactures mil-spec commercial computers under a series of licenses from Data General Corp. of Westboro, Mass., that are software-compatible with commercially available DG products [CW, Oct. 15].

The Justice Department complaint challenging the Rolm acquisition noted, "it would be unrealistic to expect meaningful competition to exist between IBM and the [Rolm] Mil-Spec Computer Division. Instead of gaining a new competitor, the military would still have only two major firms to vie for its business," the department brief said.

Following the announcement of the proposed divestiture settlement, IBM said, "IBM and Rolm disagree with this contention but have agreed to divest so that the companies might proceed. IBM believes the divestiture in no way diminishes the value of the [Rolm] acquisition to IBM."

If IBM is not able to complete the sale of the division within six months, the proposed final judgment provides that a trustee appointed by the U.S. District Court will be responsible for finding a buyer, which IBM will have to accept.

McGrath said the object of the Antitrust Division was the preservation of the Rolm Mil-Spec Computer Division or its successor "as a significant participant in the market for mil-spec commercial-based computers."

Phillip Verveer, a former Justice Department official who served in the Antitrust Division when it was pursuing its monopoly antitrust suit against IBM, called the department's action "not so surprising, because the department has shown it is amenable to negotiated arrangements where spin-offs of certain assets are required as a condition of approval.

"This action will probably not diminish the department's willingness to let IBM compete aggressively in the markets it decides to enter, and it sounds like in this instance [the department] expects IBM to enter the military computer market," Verveer added.

CW West Coast correspondent Jeffry Beeler contributed to this report.

CORRECTIONS

The correct address for American Business Computer [CW, Oct. 31] is Suite 418, 16000 W. Nine Mile Road, Southfield, Mich. 48075.

"Trends in Information Technology: 1985," a handbook for executives from Arthur Andersen & Co., [CW, Nov. 19] will be updated annually, not monthly as previously reported.

Mark Williams Co.'s C Programming System, a C compiler and source debugger for Microsoft Corp. MS-DOS 2.0 environments [CW, Nov. 5], is distributed by Control-C Software, Inc. of Portland, Ore., but is also available directly from the supplier for $495. Mark Williams is located at 1430 West Wrightwood, Chicago, Ill. 60614.

ADR® WARE™
ADR/eMAIL®

You may be just one program away from true office automation.

ADR/eMAIL is the software that makes the automated office truly automated.

It starts with speed. ADR/eMAIL delivers information throughout your organization—be it across the hall or around the world—at close to the speed of light.

But speed is hardly all of it. ADR/eMAIL will also file your messages electronically, discarding the ones you choose to discard. It provides an index showing author, subject and date, just like a paper filing system. But without taking the time or space of a paper filing system. Any e/MAIL message you want to locate, you can. Instantly.

When you receive your mail through ADR/eMAIL, you can read it, make notations on it, even forward it, just like an ordinary letter. But it exists electronically so it can't be misplaced like an ordinary letter.

ADR/eMAIL allows you to route your message to as many people as you wish. Or as few. Whichever you prefer. You can store routing lists of the people you frequently copy, and ADR/eMAIL will send them all messages at the touch of a button. You can assign an urgency to your message to make sure it gets priority treatment. And ADR/eMAIL will inform you when it has been viewed. ADR/eMAIL security features insure that only the parties you choose receive your message. And message encryption is available for even more sensitive environments.

And talk about having your cake and eating it too, if you'd like a paper copy, ADR/eMAIL will provide you with it.

And with ADR/eMAIL, electronics are only half the story. Economics are the other half.

ADR/eMAIL reduces paperwork and paper flow, reduces administrative time and costs, reduces telephone expenses, reduces mail and telex expenses and reduces training expenses because its simple, user-friendly end-user interface requires no data processing experience and little training.

Best of all, ADR/eMAIL is software you can have without spending a penny on hardware. You probably have everything you already need; an IBM (or plug compatible) mainframe, CRTs, 328X printers, PCs, TTY dial-ups and TP networks.

In short, you've already paid most of the price for total office automation. So why not start taking advantage of it.

With ADR/eMAIL.

Access charge OK may prompt AT&T rate cut

WASHINGTON, D.C. — A 6.5% long-distance rate reduction by AT&T Communications is expected next year following disclosure of the latest federal and state plan to levy a residential access charge of $1 per month that will help defray the local rate subsidy currently paid by carriers.

Additionally, state utility commissions may be empowered to levy an additional 35 cent fee on top of the residential access charge if it can be shown that large communications users have plans to bypass the local telephone company. Also the plan contains provisions that would permit state public utility commissions to grant "discounts" on the $6 multiline business access fees currently in effect for large businesses if it can be shown they are constructing bypass facilities.

These features of a federal and state plan were approved by a specially convened joint board Nov. 15 and sent to the Federal Communications Commission, which is expected to approve them Dec. 19.

Charge to raise estimated $2 billion annually

Ronald Choura, a Michigan public utility commission employee, estimated that the $1 a month residential access charge, which will also be applied to single-line business customers, will raise $2 billion annually, of which $1.8 billion could be applied toward "dollar-for-dollar" reductions of AT&T Communications' costs of $28 billion, or approximately 6.5%.

FCC Chairman Mark Fowler asked that the proposed plan be given a fair hearing by Congress, which in the past has raised objections to any access fee levied on consumers.

Originally, the FCC proposed a $2 monthly fee for residential customers that would have risen to $4 maximum.

The new joint board recommendation to levy a $1 monthly fee, if approved by the FCC, would go into effect June 1985 and rise to $2 in June 1986, where it would be frozen. The joint board also recommended that the access fee for Centrex customers who were using the service before July 27, 1983 be retained at $2 per line per month.

CABLING

from page 1

gie-Mellon's system varies slightly from the commercial version now available. Bajzek said their version has only three pairs of twisted-pair wire for voice applications, rather than the four now included. The director believes IBM increased the number of pairs in the commercial cable — which also contains two shielded twisted-pair wires for data applications — to accommodate AT&T's System 85 private branch exchange (PBX).

The university does not presently use the voice copper pairs in its cable for that application. The reason, Bajzek said, is because the university is a Centrex customer and the Cabling System was installed before it became legal to own internal telephone wiring. Carnegie-Mellon's voice pairs are currently used to support RS-232 connections but probably will be retrofitted for voice when the university turns out Centrex for a PBX.

While the Cabling System in this building has performed admirably and provided flexibility in the installation and relocation of equipment, lessons learned here have made the university think twice about using the system throughout its campus.

The cable itself is inflexible and bulky, Bajzek said. It is similar in size to a 25-pair key set wire, or roughly ¾ in. in diameter. On floors with many offices, "this amounts to a massive load of cable running back to the wiring closet," he noted.

The bulk of the wire and the need for wiring closets creates a space problem. To wire the campus with 10,000 outlets to support roughly 6,000 to 7,000 workstations would require the university to convert about 40 offices and dormitory rooms into wiring closets, Bajzek estimated.

The wire's bulk also contributed to installation expenses. It cost about $100,000 to wire Bajzek's building as it was being built, or roughly $400 per outlet. Extrapolating these figures, taking into consideration the fact that it will cost more to wire existing campus buildings, Bajzek projected it will cost roughly $7 million to $9 million to wire the university with the Cabling System, or about $700 per outlet.

This is two to three times what Carnegie-Mellon had initially predicted it would cost to wire the campus with wide bandwidth communications facilities, an estimate that was made before the Cabling System was announced. The cost is so high, in fact, that the university is now considering alternatives.

One option is to install an Ethernet local network for data and to wire separately for a voice system. Bajzek thinks this alternative would be cheaper but not substantial enough to make the decision simple. In either case, telephone wire throughout the campus will have to be replaced because its placement is poorly documented.

A technology that was not considered as an option was combining voice and data support on a PBX. Bajzek said he did not believe that a PBX could deliver the megabit speeds that he anticipates will be needed in the future. Diskless workstations, for example, may require such high-speed network connections, he said.

The fact that future bandwidth requirements are unknown is an important thought in a plan of this sort, Bajzek noted. "This is a long-term investment, and one thing we don't want to do is sell ourselves short and buy a network that doesn't have enough bandwidth for the things that we might want to do later."

In the Cabling System's favor is IBM's statement of intent to build a token-passing local network that will be based on the wiring scheme. "I don't think that we would have considered the Cabling System if IBM hadn't said that this is where IBM networking is going," Bajzek said. In the interim, the university is using a Proteon Associates, Inc. Pronet token-ring network on the Cabling System installed in its first building.

The Pronet is used mostly in a Digital Equipment Corp. Decnet to support six of the computing center's Decsystem-20s and VAX-11/780s for host-to-host communications. Bajzek said that Proteon has assured him that it will be compatible with IBM network products when they are announced. He anticipates, however, that initially the networks will have to be operated separately and connected by drivers.

> *'I don't think that we would have considered the Cabling System if IBM hadn't said that this is where IBM networking is going.'*
>
> — Tom Bajzek, Carnegie-Mellon University

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1982).
BIMSPOOK — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 85% of the I/O to heavily used POWER queue.
BIM-ODIS — Comprehensive problem analysis and display of operational CICS system. DOS and OS.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMWINDOW — Multiple terminal sessions concurrently at CRT under DOS or OS VTAM.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMECHO — Copies one CRT's output to another or printer for problem determination and demonstration.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMCNSOL — Multiple/Remote System Console function for CICS. Display-only or full input/display versions available
[illegible] — DOS/VSE System Status, Performance Measurement, and POWER Queue Display.
[illegible] — On-line JCL Edit and Submission facility.

BIM programs are cost-efficient, many less than $900, highest $4000. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly licenses, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-site or remote.

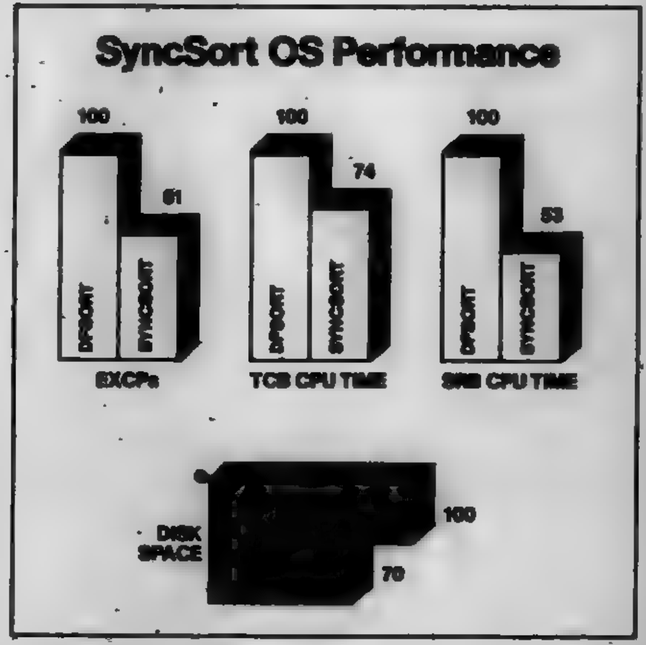
THE BEST COMPOSER SHOULD HAVE THE BEST PIANO

What could be more fulfilling in life than to realize one's absolute potential? And what could be sadder than to fail for lack of the proper equipment?

"Rousing Performance"

SyncSort allows you to perform like a virtuoso, drawing out the best your ***IBM Mainframe*** has to give.



If OS isn't your tune, you'll find our CMS and DOS performance equally impressive.

"Impressive Backstage Support"

Our Technical Service people, resolving more than 85% of all requests for technical service within 24 hours, will make you look like a star. A recent independent survey showed that 97% of SyncSort's users rate our product reliability as Very Good or Excellent.

"Harmonious Features"

SyncSort's features will impress even the most jaded impressarios, increasing programmer productivity and operational flexibility.

- Sortwriter—displays sorted data in user-tailored reports. Programmer efficiency is maximized through flexible report formatting of headers, trailers, sectioning, totals and subtotals.
- Multiple Output—provides multiple copies of the sorted output file. Each output file can be any subset of the full sorted output, and you can produce a different report format for each output file based on user-specified criteria.
- Record Editing—allows insertion of literals, commas, $, etc. as well as editing, repositioning or elimination of record fields, thereby reducing programming time.
- Fast File Copy—dramatically reduces the consumption of mainframe resources. All standard sorting features (Include/Omit, Inrec/Outrec, Sum, etc.) as well as SyncSort's unique features can be activated in a normal copy operation.
- Maxsort—provides powerful operational flexibility in sorting very large files. Sorting of these files is automatically broken into optimal steps, executable at different times; thus, the amount of data that can be sorted is no longer restrained by the amount of disk space available.

Shake-up streamlines NRC's DP functions

By James Connolly
CW Staff

BETHESDA, Md. — An agency that licenses nuclear power plants could not afford to stow potentially life-saving information in local computers, where those who needed it did not know about it or could not access it through their own systems.

By reorganizing with a top-down management approach, the U.S. Nuclear Regulatory Commission (NRC) headed off a crisis where time and money would have gone into incompatible systems and duplicated data. Now, the NRC has started work on an agencywide shared data base, has limited redundant programming and is directing microcomputer spending at approved equipment and software.

The agency, with 3,400 employees spread throughout the Washington, D.C., area, five field offices and about 60 nuclear power sites, has 50 data processing workers to maintain equipment, train users and coordinate time-sharing services and contracted software development.

In 1982 the NRC reorganized its DP operations, replacing a system where individual users too often called the shots for equipment purchases and program development.

"Before all of this, all system development was from the bottom up instead of from the top down. We would go into an office, and everything would be office-specific. We were too customer-specific," reported Harold S. Bassett, director of automated information services.

NRC formed a steering group to cope with limited resources, technological advances and end-user computing. The committee, made up of executives and DP managers, advises management on computer purchases and policies.

Bassett said that in 1982, the NRC was like other agencies and corporations — plagued by a yearlong backlog for application development and subject to demands for microcomputers. The agency imposed a limited moratorium on application development, allowing only what Bassett termed "very, very important" programs.

But the agency, spun off from the Atomic Energy Commission in 1975, had no mainframe, and thus, no central data base. Developing that data base, whether on a purchased, time-shared or service bureau mainframe, is one key to the ongoing reorganization.

The bulk of the NRC's processing is done on Data General Corp. minicomputers located throughout the U.S., handling administrative tasks such as personnel and payroll. One machine does small-scale scientific modeling, and another is being installed in an operations center that was inspired by the 1979 emergency at Pennsylvania's Three Mile Island facility.

"Back then, we were in the 3- by 5-in. cards tacked to the wall era. We were somewhere between the Pliocene and Miocene ages then," said Bassett of the Three Mile Island crisis. During an emergency or test, the operations center's DG MV6000 will track information such as weather conditions, radiation dose assessments and construction details about the specific plant.

The agency maintains two time-sharing agreements, one for complex scientific projects running on the U.S. Department of Energy's Control Data Corp. Cyber 205 supercomputers and another for management applications on the National Institutes of Health's IBM 3084 mainframes.

The institute's system will host a pilot project giving the NRC commissioners executive-level tools such as vote-tracking and scheduling.

The agency also has developed a network of 21 IBM 5520 office automation systems that access the institute's mainframe and handle word processing and document transfer tasks. In the field, plant inspectors write reports on personal computers and transmit them to the 5520s for editing.

Like other organizations, the NRC was faced with controlling the proliferation of microcomputers.

"At the end of fiscal year 1983, we had two personal computers in the agency. By the end of calendar year 1984, we will have more than 200, and by the end of next year we will have 300," Bassett said.

But to ensure compatibility, the agency now supports only micro software approved by the steering group. The agency is testing or has approved project management, spreadsheet, data base management, word processing and communications packages for various types of users, most of whom use IBM Personal Computers and compatibles.

Hands-on training on those packages, the 5520s, personal computers and the other NRC systems is being handled in a training laboratory run by the U.S. Department of Agriculture and in a support center recently opened here. More than 450 employees applied for 200 seats in the classrooms.

"Recognizing that a service organization's work never ends, our plans for the corporate information environment see about three to four years into the future. We conservatively estimate that by that time NRC will have a workstation-to-staff ratio of roughly 1:2. In a phased fashion between [fiscal year 1985] and [fiscal year 1989], our users will be able to access and share information from all our major data bases utilizing marketplace technology," Bassett said.

MITRON'S STD 1600 TRANSFERS DATA AT 56 KB OFF-LINE TAPE-TO-TAPE

Mitron's STD 1600 provides an efficient method for sending and receiving data anywhere in the world. STD 1600s communicate with each other and with other companies' bisynchronous terminals and computers.

The STD 1600 solves machine compatibility problems. It transfers data reliably without mailing tapes. It can communicate off-line to relieve an overworked computer.

STD 1600s transfer data at speeds up to 56KB. Double-buffering eliminates delays caused by read/write cycle times.

The STD 1600 can be leased or purchased.

STD 1600 features:

- Easy-to-install
- Needs no software
- Data rates to 56KB
- RS-232 or V.35
- Dial-up or private line
- Multiplexers
- 800 or 1600 bpi
- 1200' or 2400' reel sizes
- Bisynchronous protocol
- Transparent or non-transparent
- Space compression
- Variable size records to 16K
- Labels and multiple files

STD 1600 options:

- Autodialing
- Asynchronous
- Code conversion
- Modem eliminator

The STD 1600 is compatible with AT&T's Digital Data Service.

Since 1969, Mitron's magnetic tape systems have been used in a wide variety of data communications applications. Let one of our Applications Engineers explain how you can connect the Mitron STD 1600 to your system or data communication network. Call 800-638-9665. (In Maryland, call 301-992-7700.)

CONVERT

from page 1

man has been able to delay his decision with some imaginative moves to give himself more virtual storage, deflecting some "very aggressive" marketing by IBM in the process, he said.

"IBM has a big push on to get users into the 3083 and MVS. That's across the country. Everywhere I've been going, I've been hearing that," Seman said. But because he suspected that a dual-processor 4381 would be released, Seman has been reluctant to go to the 3080 series. His intuition proved correct, since IBM announced the 4381 Model 3 in October [CW, Oct. 29]. "It doesn't make sense for me to go to a 3083, with the 4381 dual processor coming out," he said.

For many mid-range IBM shops, the recent announcement of the high-end 4381 presents an option that previously was not attractive. The Model 3's high performance now makes it practical for 4300 series users to convert to the MVS operating system without having to buy into the bigger and more expensive 3080 series mainframes. However, the choice presents both advantages and disadvantages to users.

Analyst Dave Moschella of International Data Corp. (IDC), a market research and consulting firm located in Framingham, Mass., said prior to announcement of the 4381 Model 3, "running MVS/XA on the 4300 series was not a good idea," because the operating system occupied so much of main memory. IDC is predicting that IBM will cut prices on the 3080 series X models before year's end to counteract the price-performance gap with the 4381 Model 3, Moschella said.

The cost of MVS is the main disadvantage. Seman said it would cost him $6,000 more per month in licensing fees to run MVS and $16,000 more per month to run MVS/XA, which, he said, IBM is advising him he needs. An advantage of MVS for Seman would be added virtual storage. "We keep running out of virtual storage," he said. "I don't know if we can stay where we're at. But every time we go to make a conversion to MVS, we find a way around it." For example, he recently acquired a data base management system from an independent software vendor that takes the place of his Vsam files, freeing some virtual storage and buying him some time.

John Sawilchik, technical support manager in the DP department at the Robert Bosch Corp. of Broadview, Ill., an automotive replacement parts seller, is trying to weigh the greater performance of MVS against its cost. He was told by IBM that his 4381 will operate at only 80% efficiency without MVS. "You have to balance that with higher software costs," he said. The software costs, though he did not have specific prices, would be 10% to 15% higher than what he is paying now, in addition to the cost of converting his applications.

> *'The biggest fear everyone has is being left out of the mainstream of operating system development. You don't follow the trunk of the tree, but you don't get too far out on the limb either.'*
>
> — Tom McGinley, Epsilon

Sawilchik, whose shop installed a 4381 Model Group 2 in October, is leaning toward a move to MVS from DOS/VSE under VM. At a recent seminar in Chicago, he said IBM was offering the first six months of MVS free if the system was bought in 1984. "If you were on the verge of making a decision, that might push you over," he said.

For another user who has already decided to move to MVS software, the 4381 Model 3 announcement resulted in hardware savings. Tom McGinley of Epsilon in Burlington, Mass., a marketing and data base firm serving Fortune 1,000 firms, recently decided to upgrade to a 4381 Model Group 3 instead of converting to the 3083 EX model. The firm currently has four 4341s and two 4381s powering 300 terminals serving clients in the field and 100 terminals running IBM's CMS internally.

Epsilon needs room for expansion, McGinley said. The 4381s now running OS/VS1 will be converted to MVS/SP in the spring. "It was something we recognized we had to do," because OS/VS1 was no longer being updated by IBM, McGinley said.

But when converting from National Advanced Systems, Inc. mainframes last spring, Epsilon opted for IBM 4381s instead of a 3083 series X model, in a gamble that IBM would announce a higher end 4381. The gamble paid off when the Model 3 was announced because that CPU provides an estimated millions of instructions per second rate equivalent to the low-end 3080 series. "The savings was $600,000 per processor," McGinley said.

Epsilon was attracted to MVS for its greater power, although McGinley said he has some doubts. "Are you just pushing data around or are you getting processing done?" he asked. But staying current is an overriding concern for Epsilon. "The biggest fear everyone has is being left out of the mainstream of operating system development. You don't follow the trunk of the tree, but you don't get too far out on the limb either," McGinley said.

Another analyst says the decision on whether to convert to MVS or MVS/XA depends on a user company's long-term plans. Michael Geran, vice-president of research at E.F. Hutton, Inc. in New York, said, "MVS/XA is where IBM is going. Users will have to convert eventually, but a number of interim steps can be taken" to delay conversion. Users who are processing their applications on time and who have enough virtual storage can delay the conversion to MVS, he said.

Scribe® puts math in your documents

Why cut and paste to insert mathematical equations and symbols in your documents? The Scribe Document Production System software intermixes text, graphics, special characters, and mathematical equations in all types of printed output. Output such as manuals, proposals, textbooks, and technical publications. Scribe lets you include complex mathematical expressions that look professionally typeset. And wait till you see how easy it is.

Scribe is available for DEC, Prime, IBM, Sun, Apollo, and most UNIX systems. Your output can be printed on a spectrum of devices from letter-quality typewriters to photocomposers and laser printers.

Scribe makes producing mathematical output as easy as π. To get started contact Wayne McDaniel.

ARMY

from page 1

networks.

Personal computers, terminals and printers are linked to each other and to individual hosts through a Sytek, Inc. Local Net broadband local-area network. The hosts are connected to each other through a 5M bit/sec Ungermann-Bass, Inc. Net One local-area network.

Lanpher noted that the Army saved $300,000 on the 450-terminal prototype by having its own personnel run the cabling last year.

"The majority of the work was in developing software for the interfaces," he added. The networking software, including a virtual circuit handler for each terminal, and the networking configuration were developed by the Johns Hopkins University Applied Physics Laboratories. But little of the other equipment and software was customized.

Throw out baby with bathwater

"We are using off-the-shelf products wherever possible and are retaining our installed base wherever possible. The last thing we want to do is throw out the baby with the bathwater by developing a system that requires all new equipment. We had the basic concept, and we said we wanted to use standard, off-the-shelf equipment and software," Lanpher noted.

He said the prototype concept with generic products is more flexible than the Army's traditional DP approach, where it would have contracted for a complete system based on expected needs, such as the tolerable number of packet collisions, speeds and capacities. He noted that the traditional approach would have meant several years of installing a complete network and then analyzing the functionality.

Analyses of the prototype — one of which is now being completed by Control Data Corp. — can be used to define more clearly the Army's functional needs, such as a payroll application, which may not be as clear-cut as those of a corporation, Lanpher said.

Hios sent 1,100 questionnaires to users in eight Army agencies. "We got back 700, with 400 of those saying they used Hios often. This whole process of evaluation is very complex, but we were very pleased to get such a good response to a questionnaire," Lanpher said.

"We not only asked the users which applications they were using but which ones they weren't using," he added. "What we know already is that we need to do a better job in getting them up and running. We are developing an application team — people who can go around and say to the user, 'OK, you know how to use it as a basic tool. Here is how you can use it to do your job better.' " Users cited some technical problems but said they would be highly satisfied with Hios if those bugs were removed, according to Lanpher.

Hios, which follows the International Standards Organization's Open System Interconnect model up to the Level 4 transport layer, could grow to 1,200 terminals if made permanent next year, but it also could lead to Army posts around the world setting up compatible office networks linked to each other through the Pentagon's Defense Data Network.

Lanpher said developers of Hios have consulted with U.S. Navy and Air Force systems developers in the hope of establishing interservice systems compatibility.

WHEN THE CHAIRMAN EXPLODES OVER A SECURITY LEAK, WHAT'S YOUR DEFENSE?

VMCENTER:

THE ONE INDISPENSABLE SURVIVAL TOOL FOR VM DATA CENTER MANAGERS.

It doesn't matter who actually leaked it—if there's a failure in system security, it's *your* problem.

But now, at last, you have an ally. In VMCENTER.

VMCENTER puts you squarely in control of system resources—providing multiple levels of authorization, for maximum protection against security violations.

It also allows you to do a lot more. Change passwords in a flash, encrypt data through simple commands, and keep top management informed of potential problems through a variety of reports.

Best of all, VMCENTER makes *you* secure—knowing that problems are being taken care of *before* they happen, not after.

But there's more.

In addition to security problems, VMCENTER solves a lot of others, like disk and tape management, resource scheduling and accounting, even workload balancing. And it does it all in an integrated manner that's more effective than any possible collection ofquick fixes.

VMCENTER. It's a survival tool—and then some. Once you use it, you'll wonder how you ever got along without it.

And the Chairman may even learn to feel the same way about you.

For more information on VMCENTER, call or write VM Software, Inc., 2070 Chain Bridge Road, Suite 355, Vienna, Virginia 22180, telephone (703) 821-6886.

ISN

from page 1

network across its campus, according to Paul Stieman, director of the university computer center.

When completed next September, the ISN will include eight nodes and 29 concentrators, providing host support for roughly 450 remote asynchronous terminals and personal computers. End-user devices will be attached to the network through RS-232C interfaces using copper twisted-pair wire. Network components will be interconnected through a fiber-optic backbone network the university is installing (see related story above) and T1 microwave facilities.

The basic design objective, according to Don Salvin, data communications supervisor at the university, is to provide the school's terminals with increased connectivity to their host processors while reducing the complexity of the network configuration. The university has two triprocessor Digital Equipment Corp. Decsystem-10s, a uniprocessor Decsystem-10, two DEC VAX-11/780s, a VAX-11/785 and a National Advanced Systems Corp. (NAS) 8050.

Terminals in five centers

To complicate matters, the terminals on campus — most of which are located in five centers but some of which are scattered over the campus — are six miles away from the university's computer center. These locations are connected with a 12-GHz Sanbar CE-1130 microwave radio system that provides a T1 digital link operating at 1.54M bit/sec.

Today, the T1 radio capacity is divided into multiple channels with General Datacomm Industries, Inc. Megamux multiplexers. These channels are used to connect communications processors and multiplexers at the computer center with complementary processors and multiplexers on campus.

The university's two academic Decsystem-10s, for example, share a DEC PDP-11/50 set up as a front-end processor, which, through the T1 link, supports four remote PDP-11/34s to which terminals are attached. The school's three academic VAX systems, on the other hand, are multiplexed through a Rixon, Inc. DCX 850 statistical multiplexer to three remote Rixon systems that provide terminal interfaces.

The administrative Decsystem-10 is configured like its counterparts — with a PDP-11/50 front end supporting terminals through two remote PDP-11/34s — but the administrative NAS 8050 is unique. This IBM-compatible mainframe sits behind an NCR Corp. Comten 3690 communications processor that supports, through bridges and the T1 radio, a remote Ungermann-Bass, Inc. Net/One local net.

The front-end Comten is loaded with protocol conversion software enabling the use of asynchronous terminals with the NAS. Because the Net/One has a gateway to a local PDP-11/34 — as well as a direct connection to the NAS — users on campus can use the same terminal to access either administrative system.

Initially, the Net/One was installed as a test system with the idea that it might be used throughout the campus. Salvin said those plans were abandoned in favor of the AT&T system because the ISN "is more functionally capable than Net/One." While initially satisfied with the local net, Salvin reported that at higher speeds he was losing connections from board lockouts. He also noted that resetting communications parameters for a single terminal required taking down an entire board, which disrupted other users.

Those problems have not arisen with the AT&T ISN. The single-node ISN was installed in September in one day, cut over within three days and has not since experienced any hardware or software failures, Salvin said.

This ISN node is presently being used as a terminal switch within the computer center to supplement the systems previously outlined. Eventually this site will be connected through three T1 microwave radio links to the campus, where roughly seven additional nodes will be placed. Campus nodes will be interconnected with the school's fiber-optic backbone network, which will also be used to link the nodes with roughly 29 concentrators. The concentrators can extend the reach and the number of devices supported by a single node.

"Entering Our Second Decade Of Commitment To The PRIME Community"

Completed AT&T ISN to tie campus systems

The University of Pittsburgh's computer systems, housed in a center in an office park six miles from the campus, are connected to the school by a 12-GHz 1.54M bit/sec microwave link. The diagram shows how the network is currently configured and how it will look when the complete AT&T Information Systems Network (ISN) is installed.

Today, the capacity of the microwave system between the two locations is divided into lower speed channels — from 19.2K to 56K bit/sec — using a General Datacomm Industries, Inc. (GDC) Megamux.

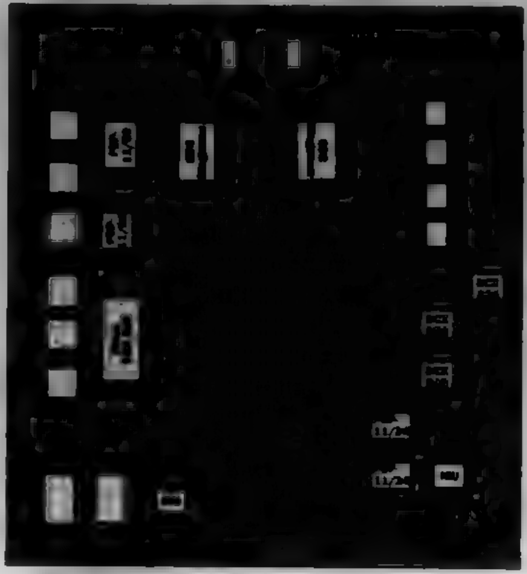
The Digital Equipment Corp. PDP-11/50, set up as a front end for the two uppermost academic Decsystem-10s, supports four remote PDP-11/34s that have multiple 1,200 bit/sec asynchronous ports. The other academic systems, the two DEC VAX-11/780s and the VAX-11/785, are connected to a Rixon, Inc. DCX 850 statistical multiplexer. The DCX 850, DCX 840 and DCX 836 on campus provide 2,400 bit/sec asychronous terminal support.

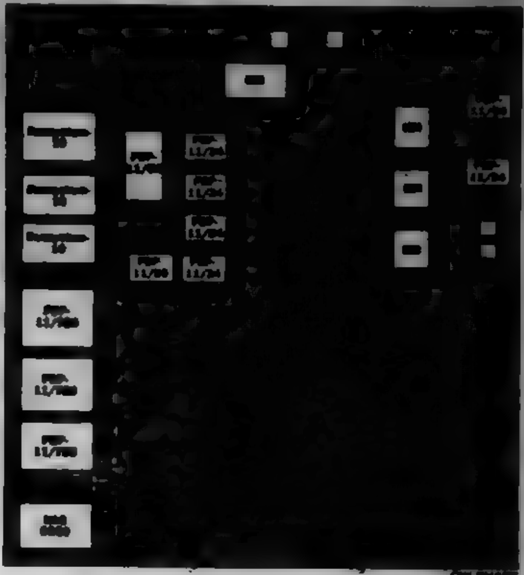
The administrative systems include the remaining Decsystem-10 — configured like the others — and a National Advanced Systems, Inc. (NAS) 8050. The 8050 sits behind an NCR Comten, Inc. 3690 communications processor loaded with protocol conversion software, enabling asynchronous terminals to be used on this IBM-compatible mainframe.

Those terminals are supported on campus through bridges by an Ungermann-Bass, Inc. Net/One broadband local-area network. The Net/One is also connected to the VAX-11/34 serving the administrative Decsystem-10 through a network interface unit (NIU), meaning local net users can access either system.

Use of the ISN will enable the GDC and Rixon multiplexers, as well as the Net/One, to be turned out. Four of the six PDP-11s configured as front ends will be moved back to the computer center as these machines are retired. Instead of the single T1 facility currently used to connect the locations, the ISN will use three 1.54M bit/sec links.

When completed, the ISN will enable terminal users on campus to access any system to which they have clearance.





CW CHART

ISN from page 10

As the ISN is being completed, the General Datacomm and Rixon multiplexers will be turned out, as will the Ungermann-Bass Net/One, and four of the five front-end PDP-11/34s will be brought back to the computer center.

This will simplify the entire network configuration and its management, according to Salvin.

For the near future, hosts will be hard-wired to the ISN, but Salvin said that they are considering writing a VMS driver to support a host interface that would reduce both the hardware and the number of wires needed to connect the machines.

The completed ISN will be functioning like a data switch, similar in manner to the way the Rixon DCXs are currently used, Salvin said. The advantage is that the ISN is more expandable and can support high-speed host-to-host file transfers, the supervisor noted. The maximum speed supported on a DCX trunk is 56K bit/sec, he said, whereas the ISN can interconnect machines at 8.64M bit/sec, the operational speed of the short bus in each node.

Costwise, Salvin said, the ISN is comparable to competitive devices. David A. Forejt, associate vice-president for computing and telecommunications, put the figure at $350 per port.

The major complaint Salvin has with ISN is that its software is "relatively primitive."

For example, in the initial release "there is no way of determining what sites are busy, [and] which aren't," he said. Software that would provide site usage data is expected to be included in the multinode release, which AT&T has promised will be available shortly to meet the university's plans.

Factory nets to be topic of sessions

WALTHAM, Mass. — C. Kenneth Miller, president of Concord Data Systems, Inc., based here, will be the featured speaker on local-area networks for factories at the Yankee Group's annual briefing sessions, "New Technologies; New Solutions."

Miller will discuss his company's Token/Net local-area net in a session titled "Factory Networks in Chaos."

The Yankee Group sessions will be held Dec. 4-5 at the Plaza Hotel in New York and Dec. 11-12 at Rickey's Hyatt in Palo Alto, Calif.

The registration fee for the briefing sessions is $875.

Information is available from the Yankee Group, 89 Broad St., Boston, Mass. 02110.

BECOME A CICS CONSULTANT IN JUST TWO WEEKENDS.

We know that it's tough for consultants to fit a weekday course into their hectic schedules. That's why SysEd offers special CICS training courses for consultants that you can complete in only two weekends.

Our intensive weekend courses in Command Level, Macro-Level, Internals, Application Design and VSAM are designed to make even non-CICS programmers immediately productive in a CICS environment. Each SysEd course provides a true-to-life learning experience with "hands-on" use of the computer, up-to-date, practical information, a solid foundation in CICS fundamentals and insights into advanced materials, and individual attention from highly qualified instructors.

SysEd's special weekend courses for consultants are held regularly at our classroom/computer facilities in New York City, Chicago, San Francisco and Dallas. Because class size is limited, applications are on a first come, first served basis.

WASHINGTON UPDATE
Mitch Betts
CW Washington Bureau

Carnegie-Mellon site of DOD software center

WASHINGTON, D.C. — Carnegie-Mellon University in Pittsburgh recently won a high-stakes competition among universities vying to be the site of the Department of Defense Software Engineering Institute, which will develop and promote techniques for automated software production [CW, Sept. 24].

The Pentagon's selection of Carnegie-Mellon for the five-year, $103-million contract followed an intense lobbying campaign by the bidding universities and their political representatives. The bidders hoped the institute would attract high-technology industries to their locales.

The Pentagon said the institute will study automated software development tools that will help military software vendors lower their costs. Also, the institute is likely to develop interface specifications for advanced communications networks that permit assembly of reusable code modules developed at dispersed locations and develop criteria for the evaluation and validation of programming environments.

Board rules against bias in airline reservations

WASHINGTON, D.C. — The Civil Aeronautics Board (CAB), continuing its assault on bias in computerized airline reservation systems, recently ruled that the systems must be able to display up to nine connect points, or "hubs," for connecting flights.

The CAB said it acted because an airline-owned computer reservation system can limit the display seen by travel agents to the hub airports favored by that airline.

The final rule, effective Nov. 14, was opposed by Delta Airlines. Delta said that expanding the capacity of its Datas II system from five to nine points would require expensive hardware and software changes, because the system features on-line construction of connecting flights, rather than prestored connecting flights.

The CAB acknowledged that its rule may have a "chilling effect" on the innovative system, but said the rule was needed because of the anticonsumer and anticompetitive effects of the systems.

Board member Barbara E. McConnell dissented, calling the rule premature, arbitrary and burdensome for the airlines.

Panel urges government to raise research budgets

WASHINGTON, D.C. — A high-level science panel is urging the federal government to increase research budgets for supercomputers and educational hardware and software.

The National Academy of Sciences' Committee on Science, Engineering and Public Policy made the recommendations to both the White House Office of Science and Technology and the National Science Foundation, according to a recent announcement.

Supercomputers are critical to technological leadership in a range of applications from aircraft design to basic chemistry, the panel said. Specific recommendations included the following: continued support for development of parallel processing, appropriate software and new programming language concepts; strong support for artificial intelligence and efforts to speed the transfer of supercomputer research results into commercial production; and teaching U.S. specialists to read Japanese technical literature.

In addition, the committee said additional research is needed, particularly in artificial intelligence, to develop "integrated [computer] systems capable of interacting intelligently and sensitively with students."

FCC approves protocol service

WASHINGTON, D.C. — The Federal Communications Commission last week granted the divested Bell operating companies permission to perform X.25 and X.75 protocol conversions for asynchronous terminals as part of their tariffed local service functions.

The FCC said the divested Bell operating companies would not have to offer protocol conversion — considered an enhanced service — through a separate subsidiary, which current FCC rules require for services not considered basic. The carriers argued that it was "not economically feasible" to establish a separate subsidiary when protocol conversions are priced out of reach for low-volume users.

FCC Chairman Mark Fowler commented after the action that the divested operating companies will be permitted to offer "more efficient" use of their local-area facilities with the protocol conversions and that "rigid interpretations of the rules" should not be used to prevent new service offerings.

The divested Bell operating companies seeking to offer protocol conversion are Northwest Bell, South Central Bell, New Jersey Bell, New England Bell, Southern Bell, Southwestern Bell and Pacific Northwest Bell telephone companies.

Dumb.

Stand-alone programs can't be made to work as a system no matter how hard you might try.

Stand-alone programs are fine. Unless, of course, you need them to work together. Because the sum of the parts will never equal a whole.

That's why even the highly touted WordStar,® dBase II™ and 1-2-3,™ programs don't make sense as a business system.

They were designed to perform very specific application functions only, and therefore, make miserable workmates.

Fortunately, there's a smart solution. It's the new Smart Software System.

Smart's unique "modular integration" is the key to productivity. It means that The Smart Word Processor, The Smart Data Manager

STC fails to deliver beta-test storage system

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — Financially troubled Storage Technology Corp. (see story, page 97) has repeatedly failed to deliver optical disk storage equipment sought by the U.S. Geological Survey (USGS), a large federal agency that is eager to beta test the equipment.

"We have been expecting the equipment for over a year, but it has never been shipped," Theodore M. Albert, chief of the USGS office of data administration, told *Computerworld* last week. He said that Storage Technology Corp. (STC) and USGS had a verbal agreement that STC's 7600 Optical Storage System would be shipped in October 1983 so that USGS could be a beta test site for the 4G-byte storage system.

Albert said USGS is "extremely interested" in the system because STC's 14-in. disks are the only affordable, high-density optical storage devices now on the market. "We need that kind of technology," he said, particularly for high-volume backup and archival storage.

Asked about the delay, Jack Scott, vice-president of STC's worldwide marketing, said, "We were behind schedule because there were a number of integration and design issues that had to be resolved. They are now being resolved."

Scott said STC is now shipping subsystems to customers for alpha tests and predicted the volume of shipments will increase in the second quarter of 1985.

For the USGS, Albert said delivery had been scheduled for September, was delayed to October, then December and now is tentatively scheduled for early spring. "Hell, I've got data sets sitting here. I've got people trained to do it. We still want to test the equipment, and we will do so if [STC] ever ships it," Albert said in a telephone interview from his office in Reston, Va.

"We've been looking at the technology for five years, kicking the tires, and we're pretty sure we want to go with it for our mass storage needs," he said. "The question is, can we get the technology in-house and start using it?"

Albert said the USGS is exploring optical disk technology for digital storage of scientific and engineering data — such as cartographic, geologic, hydrologic and Landsat satellite data — as well as for scientific and administrative records.

In addition, he said, USGS wants a digital image-scanning system for storage of the agency's massive files of maps, charts, graphs and other [illegible]

Smart.

The fully integrated Smart Software System is designed to make the whole office more productive.

and The Smart Spreadsheet with Graphics not only have the uncompromising power and capacity of these leading stand-alone programs, but they also have the unprecedented capability to work brilliantly together.

So you can easily transfer data and pass commands from one to another. Which means that you can compile financial data, to be included in graph-form, within the text of a printed report, that's mailed to a list drawn from the data manager — automatically.

Don't short change your business by attempting to squeeze the impossible out of a makeshift software system. Get Smart, and the whole office will thank you.

Smart is currently available for the IBM PC, PC/XT, PC/AT, and compatibles. For more information please call, 800-GET-SMART.

Cost, cancellations impair software quality

CW AT ENTERPRISE INFO SYSTEMS

By Kathleen Burton
CW West Coast Bureau

SAN DIEGO — Up to 25% of large software systems (those with over 64,000 lines of source code) currently under development will be canceled before they are completed, and up to 60% will experience significant cost and schedule overruns, according to T. Capers Jones III.

Jones, general manager of the Nolan Norton Co., painted a pessimistic picture of domestic software quality and programmer productivity at a seminar held recently at the Enterprise Information Systems Forum here. Jones said a recent study found that along with the cancellations and overruns, approximately 75% of the large systems under development will experience serious operational difficulties.

Today, the average large system software project runs more than a year behind schedule and costs almost twice as much as initially estimated, Jones said.

Factors slowing development

Armed with statistics gathered from his study of 200 major U.S.-based corporations, Jones said that several key factors caused the development slowdowns — variations in productivity related to program size, the complexity and originality of the program and changing program development models.

· Program enhancements in a large program (250,000 lines of source code) usually require twice as much time and money to develop as first-time, stand-alone programs, Jones said, due to increasingly complex requirements for base code analysis, program recompilation and configuration control.

Jones' study showed that, on the average, it takes 48 to 60 months to develop a very large program (with over 512,000 lines of code), 15 to 36 months to develop a medium-size program (with up to 64,000 lines of code) and five to 15 months to develop a small program (up to 2,000 lines of code). To avoid significant cost and schedule overruns, he said, companies must use realistic development schedules based on these projections.

In very large programs, defects in coding, documentation and incorrect bug fixes result in an average of 300 serious errors per 1,000 lines of code, Jones said. To correct this, the development model is emphasizing longer design times, high-speed prototyping and a shorter debugging phase.

Another problem facing software developers is the rising cost of software maintenance, a cost that has skyrocketed to as much as 80% of the total development budget. IBM maintains over 30,000 application programs, he said, adding, "Maintaining 30,000 programs can get as expensive as maintaining a fleet of 30,000 Cadillacs." According to Jones' figures, a program with 250,000 lines of source code used by 1,000 international users will cost $79,000,000 to maintain over a five-year period.

Recent studies conducted internally by IBM, TRW, Inc. and Nippon Electric Co. of Japan showed that maintaining "error-prone modules" (those portions of programs with clustered errors) is the most expensive single task in the industry, Jones said. If error-prone modules of programs can be isolated and recoded, companies can realise considerable cost savings, Jones claimed, because only specific program areas need to be reworked.

Baseline software quality and productivity can be increased and maintenance costs reduced by as much as 75% by using structured code, program generators and high-level programming languages, Jones said. Another productivity enhancer catching on with U.S. and Japanese corporations is the development of standard libraries containing blueprints of reusable code. Code blueprints can lower development time by 80% and decrease program defects by over 20%.

PTC conference set for January

HONOLULU — Representatives from four Asian and Pacific nations will review the development of telecommunications in their countries at the Pacific Telecommunications Council's (PTC) eighth annual conference Jan. 13-16 at the Sheraton Waikiki here.

Case studies of Korea, Taiwan, New Caledonia and New Zealand will be presented during afternoon sessions of PTC '85. Y. K. Chen, director of telecommunications for the China, will review his country's move toward a digital environment. Registration fee is $395 per person.

More information is available from PTC at Suite 308, 1110 University Ave., Honolulu, Hawaii, 96826.

IBM policies said to push DP centralization

Analyst cites company's software fees as example of bias against distributed processing

By John Desmond
CW Staff

NEW YORK — While IBM appears to have taken a neutral stance on the issue of centralized vs. distributed information networks, the company continues to encourage users to adopt as much centralization as it can, according to consultant, author and lecturer Fred Lamond.

Speaking at a seminar on IBM strategy here recently, the specialist in analysis and evaluation of IBM cited the following IBM strategies that encourage centralization:

- Software license fee policy.
- The IBM Network Communications Control Facility (NCCF) and Operator Communications Control Facility (OCCF) programs.
- Instant data base updating.

IBM "fought for a long time against distributed processing," Lamond said, defining distributed processing as systems in which processing is shared between remote and central CPUs. (In contrast, in dispersed processing the remote CPUs have no communication with the host.) According to Lamond, since 1979 IBM has formally announced a more neutral position concerning centralizing networks.

Users who have multiple 4300 series CPUs as satellites, who may want to run an electronic mail program on each one, run up against IBM's policy on licensing.

IBM software licensing policy

The policy requires that a software license fee be paid for each CPU running a program, regardless of CPU size. A 4361 Model 3 processing 100 transactions per day will pay the same fee as a 3081 Model KX processing 10,000 transactions per day, Lamond said.

"The flat rate per CPU license fee encourages users to run programs on the smallest possible network of CPUs," Lamond said. He added that IBM usually raises its software license fees when it announces hardware price reductions. "The more you distribute program products, the more your software license costs will go up in relation to your hardware. This is an important tool IBM uses to encourage you to centralize," Lamond told his audience of DP professionals.

IBM's NCCF and OCCF programs encourage DP professionals to be physically located at the host site, "so that no systems programmers are required at a distributed site," Lamond said.

When systems programmers themselves become distributed, "mini DP departments" may rise and a loss of control could result, Lamond suggested.

With NCCF, any workstation becomes a control console, and the remote site needs only an operator. The OCCF preserves a system dump of a program stopped by a programming bug on disk at the remote site, instead of printing it out. The dump pages are forwarded one at a time to the host.

Lamond said that in IBM's image of a typical computer network in the mid- and late 1980s, the host mainframe runs MVS, and data is archived to magnetic tape only from the host. "All DP professionals are at the corporate host site, responsible for all data archiving and for upkeep of the corporate data base," Lamond said.

The local satellites are equipped only with disk drives — no tape drives — and the data on disk must be moved upstream to the host for updating.

'IBM pushing a bit too far'

Although Lamond said he likes the system, there is one aspect that he said "IBM is pushing a bit too far."

That aspect is requiring updating of the corporate data base simultaneously with transactions at the remote sites, which is a communications expense as well as a processing demand. "You may have applications where you need that instant, on-line communications, but for most users, the corporate data base as a backup for the local [data base] is a good idea," Lamond said.

"I do not believe the corporate data base always has to be brought up simultaneously." Once or twice a day would be adequate, he added, noting that with such a practice, "You will probably be able to do with a much lighter host."

have here
communicate.

Word processors can't always communicate with other word processors.

Internal mail networks can't often communicate with other outside networks.

Apples can't communicate with oranges.

People can't always communicate with people.

The advanced technology that was designed to enhance communication is sometimes leaving its users wondering if it might be better to go back to the Pony Express and carrier pigeons.

The answer? The QUIK-COMM™ System, a global electronic mailbox service.

QUIK-COMM is a worldwide communications integration system. So you can make your business information as multi-national as you are.

It's the largest, most advanced and comprehensive worldwide business communication system, with a continually expanding array of enhancements. And the system allows utilization of your existing equipment.

No other system can match what we offer in network, application capability and worldwide coverage. And no other system has the name General Electric on it. Which says a good deal about things like quality, reliability, service support and commitment.

We'll work together to define your needs, and develop the best solution for you. Call 800-638-9636, ext. 2001 or contact us by electronic mail.*

Nursery's ordering system cuts wilted sales

By Paul Gillin
CW Staff

SAN DIEGO — Order processing and billing at Santa Ana, Calif.-based Hines Wholesale Nurseries are a little different from most wholesale businesses. If Hines misses a shipment by even a few days, it could mean canceling the whole order or even scrapping the product.

That is because Hines deals in an especially fragile product — ornamental plants. Its 420-acre Santa Ana nursery grows 20 million plants annually, 800 varieties in all. That makes Hines one of the top three producers of container-grown plants in the country. The company also operates nurseries in Houston and Vacaville, Calif.

To process orders in 24 hours or less, Hines uses an IBM System/38 with 4M bytes of main memory and a line of integrated financial software from Professional Computer Resources (PCR) of Oak Brook, Ill. The two sister nurseries, located in Houston and in Bacaville, Calif., and the Hines sales staff are kept on-line to the Santa Ana nursery through four dedicated communications lines, according to Jim Wapelhorst, director of management information systems. Wapelhorst was interviewed at PCR's Fall User Conference, held here recently.

The perishable nature of Hines' products makes on-line processing a necessity, Wapelhorst said. The company's 30 sales representatives use Applied Digital Data Systems, Inc. Viewpoint portable terminals to enter orders from around the country. Sales representatives can also log on to the System/38 to check the status of nearly any order at any time.

CW photo by P. Gillin

Wapelhorst

When an order is entered into the system, it passes through a credit check and is either put on hold or cleared for shipment. The order pops up on the shipping managers' screens at any combination of the three locations that will fill the requirement. The manager decides in which truckload the order will be shipped and enters that number into the computer.

The software then calculates the size, weight and shipping charges of the load and also factors in extra charges like boxing costs. It also assigns a dock number where the plants should be loaded.

Picking labels then come off the printer, detailing the pertinent information for loading. The picking orders are sorted by variety of plant so that tractors can bring back fuller loads and spend less time traversing the fields to pick up bits and pieces of an order, Wapelhorst explained.

A quality assurance (QA) inspector has a last chance to modify the order prior to shipment. "Because we're dealing with perishable products, customers may want only a bud or a bloom on a plant," Wapelhorst said. "QA people can modify the orders and include explanations why a product wasn't shipped. When the shipper is just about to send out a truck, he hits a button and prints out a bill of lading for that shipment."

Hines plans to install PCR's manufacturing software next year, Wapelhorst said. "The whole idea is to know what our costs are and to have the plants in stock the shortest period of time after [they are] ready for sale," he said. "Unlike a lot of operations, when our inventory is on the shelf, we have to water it, prune it and take care of it."

Productivity meet slated

TUCSON, Ariz. — The Sixth Annual Conference on EDP Performance Management, sponsored by Applied Computer Research, Inc., will be held at the Doubletree Inn here March 11-15.

The conference will focus on the productivity of human and machine resources in serving user needs, with primary attention to managerial aspects. Specific topic areas will include the integration of business and data processing planning, capacity management, peformance management, human factors, costing and pricing and communicating with management. A one-day tutorial on "Improving the Data Center Function" will be held Monday, March 11.

Prices for the conference are as follows: for the one-day tutorial held March 11, $100 for either subscribers or nonsubscribers to Applied Computer Research publications; for the entire conference, March 11-15, $500 for subscribers, $575 for nonsubscribers; and for both the tutorial and the conference, $575 for subscribers and $650 for nonsubscribers.

More information is available from Applied Computer Research, P.O. Box 9280, Phoenix, Ariz. 85068.

Softfair '84 recruiters emphasize experience

Companies seek senior software, scientific engineers, communications managers

By Maura McEnaney
CW Staff

WALTHAM, Mass. — Senior software engineers, communications managers, scientific engineers and program analysts were all in demand at Softfair '84, a job fair held here recently for software professionals.

For the 50 companies exhibiting at the job fair, employment needs ran the gamut, but for those without prior experience, one factor was evident: Entry-level job seekers need not apply.

At the well-attended Digital Equipment Corp. booth, signs calling for telecommunications professionals, software engineers and MIS professionals decorated the exhibit. In the center of the display was a sign reading "no entry-level positions."

"We do our entry-level recruiting on college campuses," said Bill O'Connor, manager of technical support.

At the Foxboro Co.'s booth, staffing specialist Fred DelGizzo said his company, a manufacturer of process management and control systems, had 30 technical positions available. The company was looking for software specialists in AT&T's Unix, C, Pascal, applications software, communications software as well as graphics and diagnostics. The average salary offered for these slots is $30,000 to $40,000, he said.

Range of visitors

Visitors to Softfair ranged from programmers who wanted to switch concentrations to technicians curious about current employment opportunities. Because of the sensitivity involved with job hunting, *Computerworld* agreed to use only the first names of the attendees.

Larry is a project manager with four years of experience at one company. After a career switch, Larry believes he entered his current position "at too low a salary. . . . It's been a good learning experience, but I have to make up for some salary," he said. As a project manager, Larry is looking for $50,000 a year. "I don't know if I'll get it; if I don't, I'll be happy where I am."

Shirley is a Cobol program analyst and a software consultant with three years' experience in Cobol programming. She said she is looking to spend less time in front of a computer terminal dealing with accounting problems. She said she was at the fair exploring opportunities in marketing support or technical writing. But she found her reception somewhat cool. "[The exhibiting companies] are hoping Mr. or Ms. Right will walk through the door knowing everything about Cobol, C, Unix and CICS . . . and be a living doll," she said. Shirley is now making $28,000 a year. "If I can match it and get into a situation I like, that will be even more important to me."

With four years of experience in Cobol programming for business applications, Chris is looking to switch her concentration. "The market is changing, it's going away from mainframes and into micros," she said. "I'm interested in a job where I can keep up with what's happening." Chris now makes $28,000 a year, but said that if she switches jobs, she would be looking for $32,000. But, she said, "Money is not a major consideration."

OIR publishes summary of '82 users meeting

WALTHAM, Mass. — The Organization for Industrial Research (OIR) is making available the summary of the 1982 OIR Users' Meeting, documenting the experiences of users of group technology, classification and coding and computer-assisted process planning.

"The 1982 OIR Users' Meeting Summary" contains case histories documenting the application of OIR's computer-aided design and manufacturing and group technology manufacturing software products.

Articles cover topics such as implementation procedures, benefits, human factors, hardware requirements, time standards, computer-aided process planning and computer graphics.

OIR currently publishes four software packages for the manufacturing industry. They are Multigroup, for group technology analysis; Multicap, a computer-aided process planning package; Multitreeve, a design retrieval system; and Multiclass, a classification and coding package.

The book costs $30.

More information is available from OIR, which is located at 240 Bear Hill Road, Waltham, Mass. 02164.

S.I.S.S.Y (sis'ē) *n.* **A smart data processing professional who has used Single Image Software™ to solve multiple-CPU related problems.**

Whether your company has ten mainframes or just brought in its second computer, a multi-processor configuration that shares DASD complicates your operation. S.I.S. is the high performance family of Single Image Software products that makes things simple again for everyone, from technical staff to operations people, right through to end users.

Transparently, S.I.S. products work across all systems to safeguard data integrity, speed up the accurate flow of information and dramatically streamline operations. S.I.S. helps bring your multi-system complex up to peak performance while saving time, money and valuable on-staff talent.

SUPER
M S I

Multiple-CPU's let you distribute workload between systems. Sharing DASD moves the jobs even faster. But what about the bottlenecks and job back-ups when hardware RESERVEs lock out entire devices? What are you doing to protect files from being clobbered when two users inadvertently modify the same dataset simultaneously?

If you're a S.I.S.S.Y, you give the problem to Super-MSI,™ the Single Image Software Multiple Systems Integrity facility. Super-MSI eliminates RESERVE lockouts and insures data integrity in a shared DASD environment. With no complicated job scheduling, elaborate control schemes or extensive software changes, Super-MSI guarantees your data integrity and eliminates your problems.

M S M

Do you want to save your operators from the tedious and error-prone chore of manual tape monitoring? Prevent tape overwrites? Relieve your budget of duplicate hardware costs and your systems staff of job reruns?

As every S.I.S.S.Y knows, you solve the problems of sharing devices in your multi-system complex with MSM®.

MSM, the Single Image Software Multiple-Systems Manager, automatically manages the allocation of shared tape and mountable disk drives across all systems in your complex. With MSM, your operating system controls which system can use which tape drive right now so your operators can concentrate on more productive tasks.

G C D

In a multi-system environment, monitoring systems can become a real run-around with an operator going from console to console reading messages, issuing commands, and responding to replies.

GCD,® the Global Console Director, is another valuable and powerful S.I.S. aid that routes all system messages through one console, taking streams of console messages and blending them into one. GCD allows each individual console in your complex access to and information from all systems in the complex, saving operator time, reducing hardware costs and improving operations. As a S.I.S.S.Y, you may find your hardware savings exceeding the cost of Single Image Software!

Single Image Software gives shared DASD users multiple CPU power with the operational simplicity of a single unit system.

It's no wonder more and more shared DASD users worldwide are proud they've turned S.I.S.S.Y. It's why you should, too. For more information on Single Image Software, call 800-237-2057. (In Florida, call (813) 263-5011.) Or be a S.I.S.S.Y free by just calling today for a 30-day trial of Single Image Software in your data center.

I'm sold on S.I.S.

High-tech firms hire pros, lower costs at job fair

By Maura McEnaney
CW Staff

WALTHAM, Mass. — At a function center adjacent to this state's self-proclaimed "Technology Highway," Route 128, local companies gathered with aspirations of hiring the best and the brightest of the area's software professionals.

Inside, specialists clad in business suits and bearing resumes drifted down aisles of booths boldly displaying company logos and in-house brochures. When they stopped to look, smiling personnel would extend a hand and begin their pitches.

This was Softfair '84, a two-night exhibition of corporations in the market for trained technological help.

Aids market exposure

Job fairs like this one are becoming increasingly popular, both among corporations looking to reduce hiring costs and professionals seeking exposure in the job market, according to David Callahan, manager of Software Career Link, sponsor of Softfair.

That popularity is evident in the number and names of participants. This year, Software Career Link sponsored seven job fairs in the Boston area. Next year, the company is taking its show on the road, planning 42 fairs for 13 cities, including Atlanta, Chicago, Dallas and Anaheim, Calif.

More than 1,000 attendees

At this month's fair, more than 50 companies paid about $2,700 a piece for booths at Softfair, which was attended by about 1,050 professionals. This year's roster included some heavy high-tech hitters, such as Adage, Inc., Cincom Systems, Inc., Cullinet Software, Inc., Digital Equipment Corp., Hewlett-Packard Co. and McCormack & Dodge Corp. For many firms, it was a new experience.

Softfair and other similar job fairs are "a godsend" according to Frank Emro, senior technical recruiter at Cullinet. The average cost of hiring a professional can range between $4,000 and $10,000 or more if an employment agency is used, Emro said. "If you take out a full-page ad in the *Boston Globe*, that cost can be $18,000 to $20,000, and you spend a week going through resumes." According to Emro, "Job fairs are a very inexpensive way to talk to a large number of very qualified candidates."

Reduces hiring costs

Hiring is almost continuous at Cullinet, which nearly doubled its work force over the past 16 months, Emro said. In addition, the company expects to hire another 700 workers over the next year and a half, he said. The company hires an average of between seven to 10 people as a result of each fair, which significantly reduces the cost per newly hired employee to about $100 per person, according to Emro.

For DEC, job fairs give department managers the opportunity to meet applicants face to face and immediately begin assessing the needs of the prospective employees, according to David Bausch, personnel recruiter at the DEC office in Merrimac, N.H. "If you can hire one person from the show, it's worth it," he said.

Although she is not convinced that it is the only way to hire qualified candidates, Robin Schwartz, group personnel manager at McCormack & Dodge, agrees with her colleagues. This year, the software company participated in about 10 job fairs, including five Softfairs, Schwartz said.

At each fair, the company expected to hire three or four candidates (about the average, according to Softfair's Callahan), bringing down the cost of hiring to about $500 per person, she said.

In addition to computer-related companies, general industry is beginning to be a big participant in the Softfairs, Callahan said. This year, Stop and Shop supermarkets, John Hancock Insurance Co. and retail store chain Zayre Corp. were among exhibitors. "Because these firms employ sophisticated computer systems, they are joining the high-tech crowd," he said.

DEC→TO IBM/SNA

Full SNA capability for your DEC computer! Comboard™/SNA gives your terminals access to IBM interactive applications. Data can be transferred between systems, all in the complete *fully supported package*. Comboard/SNA from Software Results.

Proven and reliable. Comboard/SNA is a single-board 256kb communications computer that plugs into your DEC Unibus. Teamed with Comboard software the system is a *cost-effective* solution to troublesome SNA communications problems.

Your DEC emulates an IBM PU Type 2 communication node. You have a *full gateway into your SNA* without passing through a secondary network.

Is Your Payroll Tax System Hogging Your Time?

Chances are your payroll taxing software is hogging unnecessary amounts of time, money and resources. BSI-TAX can change all that.

You can save because BSI-TAX is the most extensive software for payroll taxing ever developed.

- Easily updated by non-DPers
- Not compiled for tax changes in five years
- 400 + consecutive tax updates supplied without an error
- Available in COBOL and RPG III for minis and mainframes

Put payroll tax changes in the payroll department. Get rid of the payroll tax hog. With BSI-TAX you save time, money and resources.

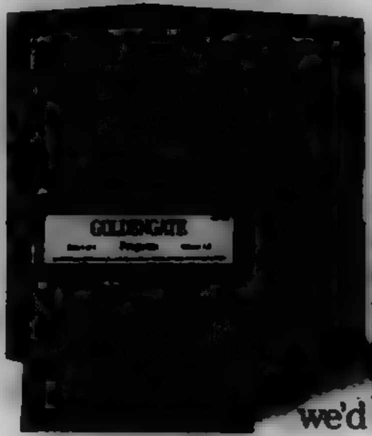
The pc software to use if you have IDMS/R.



At last count, there were more than 50 integrated personal computer software packages.

But for companies with IDMS/R, we'd like to suggest that only one really makes sense.

GOLDENGATE™, Cullinet's pc software package, integrates seven components: database, spreadsheet, graphics, document processing, 3270 terminal emulation, asynchronous communication, and information manager. While the software is exceptional on a standalone basis, it offers an added benefit to pc users in an IDMS/R environment—true micro-to-mainframe integration.

Through the Information Database (IDB), the Cullinet software product that serves as a foundation for corporate information management, a GOLDENGATE user can have direct "transparent" access to all data stored in the IDMS/R database. Indeed, with GOLDENGATE, accessing corporate data is indistinguishable from accessing data on a diskette.

The Complete Software Solution

To find out more about GOLDENGATE, IDB and other components of our complete approach to information management, attend a Cullinet Seminar. To make arrangements, phone, toll-free, 1-800-551-4555.

The pc software to use if you don't have IDMS/R.

How does GOLDENGATE™ stack up against the more than 50 competitive integrated pc software packages on the market today?

With all due respect to those other packages, we'd like to suggest that it stacks up best.

GOLDENGATE's superior functionality results from its unique architecture. Each function in the program is designed to provide an optimum working environment. And each is linked to the others through core software.

The result is a functionally rich integrated pc package for business professionals. GOLDENGATE integrates spreadsheet, database, word processing, graphics and telecommunications capabilities. For use with databases other than IDMS/R, GOLDENGATE has a unique capability in combination with a standalone version of the Information Database (IDB) from Cullinet, a remarkable ability to effect effortless micro-to-mainframe integration. Integration so direct and transparent it allows the user immediate access to corporate data as needed.

GOLDENGATE, the integrated software that works better, because each of its components work better.

To find out more, we encourage you to attend a Cullinet Seminar. To make arrangements, phone, toll-free, 1-800-551-4555.

Cullinet

We understand business better than any software company in business.

Strategic planning vital to computer security

By John Gallant
CW Staff

ROSEMONT, Ill. — Q. How do you eat an elephant?

A. One bite at a time.

According to Martin Silverman, a partner in the Management Consulting Services Division of the accounting firm of Coopers & Lybrand, that riddle holds in it the key to successfully securing an organization's computer systems. Silverman, who spoke last week at the 11th Annual Computer Security Conference here, told attendees that quick fixes and easy solutions to security were not the answer. Security must be approached one bite — or step — at a time. And planning, especially strategic planning, should be relied upon as a guide.

"[GTE Telenet Communications Corp.] and other public networks have been unfairly accused of providing illegal access to supposedly secure systems," Silverman said. "But we cannot assign blame to Telenet and the others. Like Shakespeare said, the fault lies with ourselves. Examples of lousy security and poor planning abound. Strategic planning is the missing link in security today."

One characteristic of such poor planning, Silverman said, is that security has historically been considered a burden for users; security is often traded for so-called user friendliness. He said security has been a nonconcern for management, who either did not understand or care about its importance. In addition, security has been handled as merely a procedural issue for DP auditors who performed some perfunctory security checking, and it has been little more than an after-thought for DP.

Those factors have led to security mechanisms that are superimposed on applications once the system is already designed, developed and implemented and that are limited by convenience because designers fear users simply will not put up with strict security. Once in place, Silverman said, those mechanisms are thwarted by practice and a basic lack of understanding.

What's more, Silverman said, the security problem is worsening. Minicomputers and microcomputers, in addition to mainframe-connected terminals, are proliferating, and user sensitivity to security concerns is dropping as desktop capabilities increase.

"Despite the publicity surrounding the hackers," Silverman said, "we are not gaining any ground, whatever their motives. The rats are getting smarter while the trap makers fall behind, and the owners cannot be bothered."

"At the same time," he continued, "we are being told that the effective utilization of corporate data through efficient information systems will improve profitability and provide a competitive advantage. We are told that data is a major asset that can give you an edge. We are not being told that inappropriate security can destroy such an edge, and that is the clearer reality."

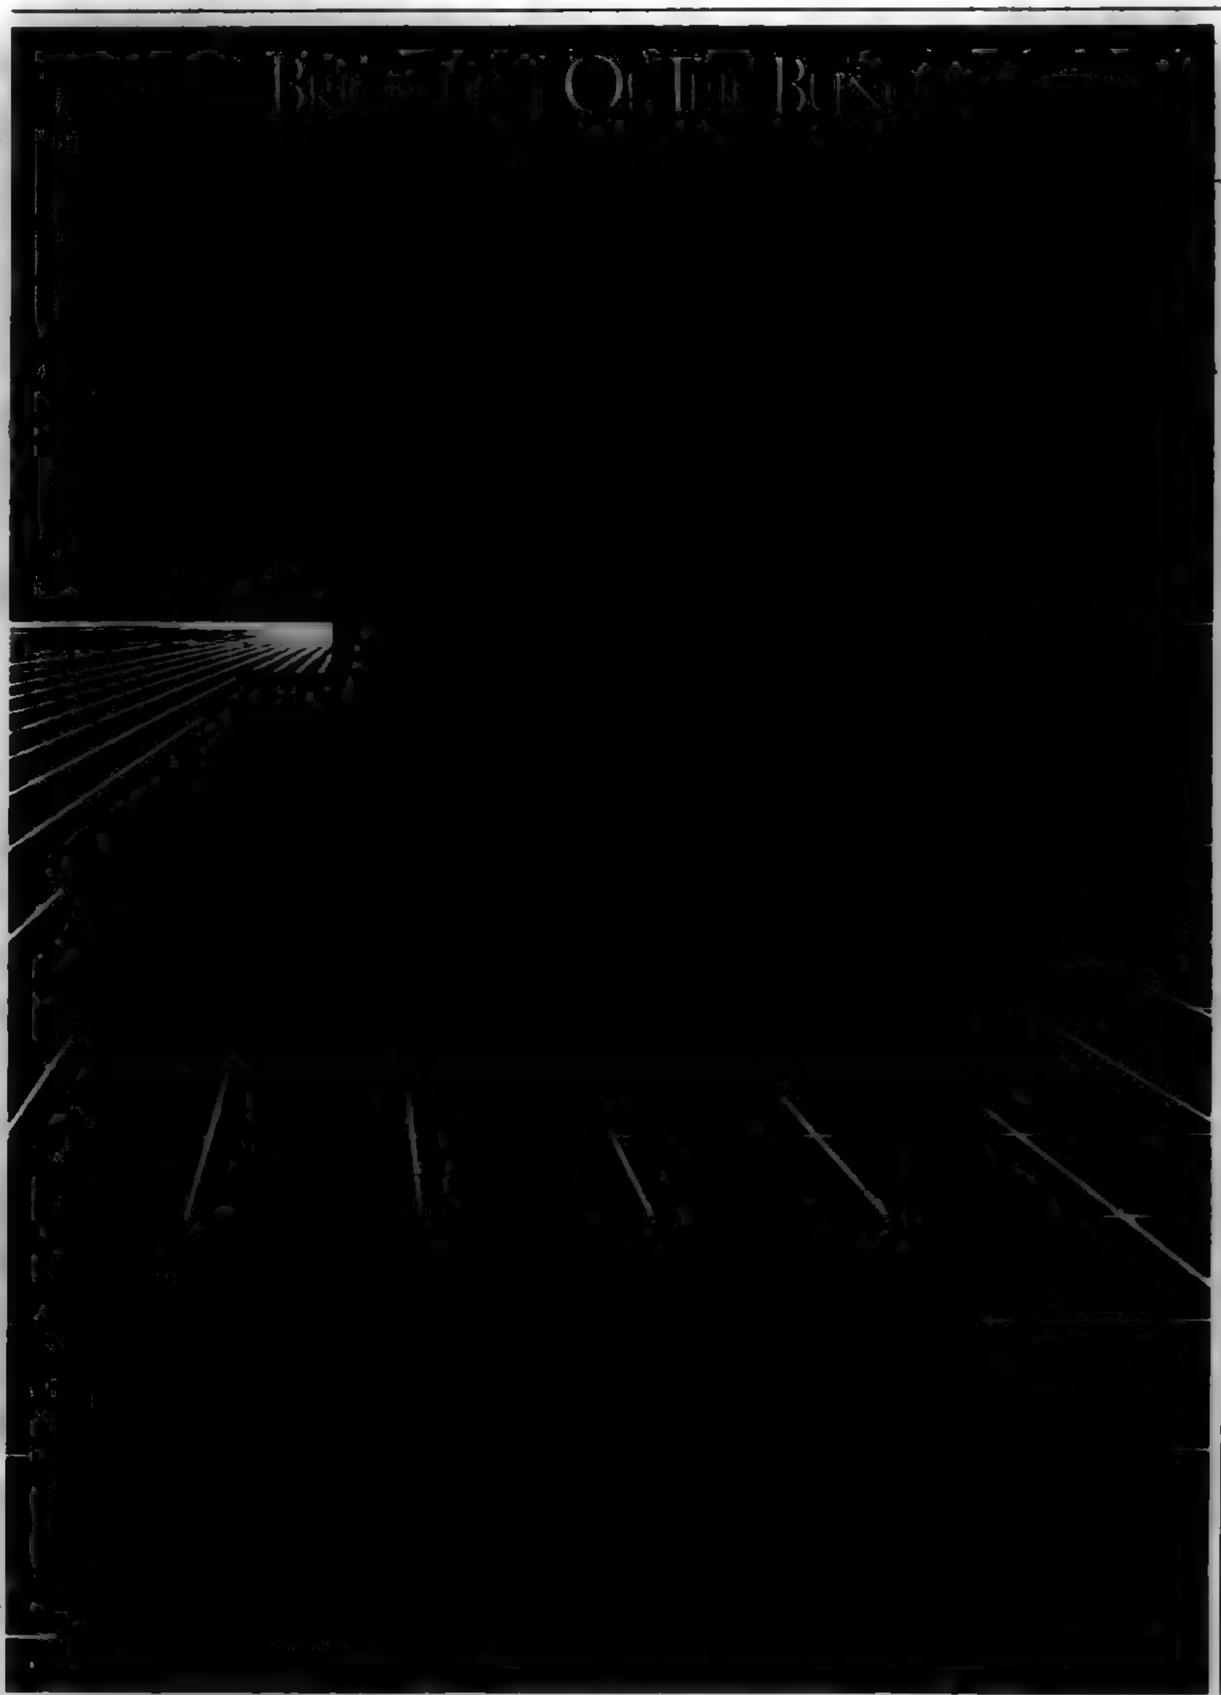
Silverman described a Coopers & Lybrand study based on interviews with top-level managers in major U.S. corporations. According to the findings of that study, more than 50% of the senior managers queried said they believe their businesses and industries are mature or declining. Thus, marketing and increased productivity are seen as more important than new strategic directions.

The findings, according to Silverman, indicate that accurate data and its protection are vital to American business today.

"Information integrity, communication, manipulation and analysis outside the traditional DP shop are critical success factors in modern American business. Security is a key element in ensuring the first three, and the fourth is impossible without security. We simply must convince senior management that security is vital to the mission of business today," he said.

In order to do that, Silverman said, security coordinators must "shed their mechanic's overalls" and take a seat at the corporate planning table. Security personnel must act as catalysts, bringing functional groups within the organization together to work out security guidelines and projects. Organizations must adopt a new approach to MIS development — an approach in which security becomes a basic component of system design from the beginning. In addition, senior management must become more involved in security planning and must understand the vital nature of information integrity.

Silverman suggested that security coordinators begin by constructively stating the case for a strategic approach to security. That includes stating the facts about security without relying on "fear tactics" and outlining reasonable costs and goals. Security personnel should also include in the management presentation a first project plan — what he described as the first bite of the elephant. Finally, he urged coordinators to document objectives to provide landmarks against which future progress can be measured.



Standards key to small-scale systems security

By John Gallant
CW Staff

ROSEMONT, Ill. — Ironically, acquiring a small-scale computer system can make an end user acutely aware, often for the first time, of the security problems mainstream DP faces.

In a typical scenario, according to Evany Miller, an end user reads in a trade or business publication, such as *Computerworld*, about a revolutionary small-scale system recently made available that promises to solve a plethora of nagging problems.

Miller, a senior data security analyst with Rainier Bancorporation who spoke at last week's 11th Annual Computer Security Conference here, said the system offers the user an end to reliance on mainstream DP and spurs visions of increased productivity and capabilities. Thus, the small-scale system is brought in-house, and the user is off and running — sort of.

"But no one told the manager that there were some direct correlations between mainframe and microcomputer security," Miller said. "For example, the user has to pick a good password, and he or she has to see that there is no sharing of passwords among the users of the small-scale system. The manager is also faced with building in accountability, maybe even audit trails, to ensure data integrity. The user has to provide for physical device security and for the backup of data on diskettes, both on- and off-site.

"These were all DP responsibilities before," Miller continued. "Suddenly, they are all the managers' responsibilities."

Security coordinator's job

To prevent security chaos among the many users of small-scale systems within an organization, Miller said, it is imperative that security coordinators draft, maintain and communicate to end users specific, carefully established corporatewide policies, standards and guidelines. She said they should encompass everything, including the selection of hardware and software, the acquisition process, security responsibilities, information classification and physical security of small-scale systems. Miller defined small-scale systems as intelligent processing devices such as minicomputers, micros and office automation equipment.

"It is your responsibility as security professionals," Miller told the audience, "to provide insight to users on the protection, integrity and security of small-scale systems. They can be invaluable as tools for specific needs, but without orchestrated management, they can result in frustration and confusion."

According to Miller, such policies, standards and guidelines are essential to a proactive, rather than a reactive, approach to computer security. "Small-scale systems are with us to stay," she said. "But the random purchase and use of such systems may be setting your organization up for disaster. Good policies and procedures can make these tools the valuable assets they were intended to be."

Miller said policies and guidelines for selecting hardware and software offer such benefits as providing for compatibility of devices, potential price discounts for volume buying and improved positioning for working out maintenance agreements with vendors. Policies for acquisition can encompass guidelines for risk and cost/benefit analysis, provide control over requisition, approval and installation and encourage a complete inventory of all computing resources.

"Policies presuppose a corporate architecture for the future use of automation," Miller said. "They can serve as a means of communicating to people what their roles are in protecting company information."

As an example of a formalized set of policies, standards and guidelines, Miller exhibited Rainier Bancorporation's systems integrity policies. Rainier's documents include a description of the legal basis for computing security and controls, a statement of the company's data security policy, an in-depth summary of security responsibilities and information on data classification schemes and standards for the control of information and computing resources. Also included in Rainier's policies are standards for the physical security of systems.

MicroFrame, Inc.
205 Livingston Avenue • New Brunswick NJ 08901 • (201) 828-4499

DEAR HACKERS,

You have caused much expense and damage. By the looks of things, you've only just begun. We at MicroFrame have developed a device to KEEP YOU OUT. It's called DATA LOCK & KEY. With a DATA KEY, access is effortless. Without a KEY it is impossible to 'HACK' your way into any type of system if it is protected by a DATA LOCK.

HACKERS CAN BE USEFUL

Our own computer is protected by a DATA LOCK. We invite you to dial in (201-828-7120). You will be answered by a 1200 BAUD MODEM. The data we gather from your efforts will help us to ensure that our DATA LOCK & KEY is the best protection available.

HELP IS AVAILABLE

For clues, just call our voice line (201) 828-4499 and ask for DATA SECURITY.

Thank you.

Micro software TV ads play to mixed reviews

By Edward Warner
CW Staff

When Lotus Development Corp. ran a series of television commercials for its then-new Symphony integrated software during the 1984 Summer Olympics, the dealers were not the only ones beseiged by Symphony-hungry customers.

Ron Goldfarb's phone rang off the hook.

Goldfarb, manager of office automation systems for Pratt & Whitney Aircraft Group in Hartford, Conn., said he received dozens of calls after the series of ads aired, most of them from his firm's users of Lotus' 1-2-3 software.

Independent microcomputer support manager Karl May, meanwhile, said he found the magazine ads and television commercials from Apple Computer, Inc. sparked interest among the corporate users to which his firm, Complete Technology Corp., located in Elmhurst, Ill., provides micro support, peripherals and software.

Every available inch of advertising space, reportedly worth $3 million, in the November election issue of *Newsweek* magazine was devoted to Apple products.

Little or no impact

Other micro managers, however, have found the ads have had little or no impact on their users, and some, noticing greater brand awareness among users, attribute it not to advertising but to a continuing rise in user sophistication.

Surprisingly perhaps, several retailers also gave mixed reviews — at least on selling power — to the 1984 ad campaigns of firms such as Lotus, Ashton-Tate and Apple. The campaigns, which made heavy use of television, may have promoted name recognition for the firms but did little to improve product sales at the corporate level, said Tony Morris, whose New York-based Morris Decision Systems, Inc. sells micro hardware and software to corporate customers only.

Morris said he was in a "peeved mode, rather than an [enthusiastic] mode" because of the lack of success of any of the campaigns. Madison Avenue, he charged, has "hosed down" the personal computer industry, and "many of those moneys [spent on advertising] have been wasted."

Ralph Wagner, owner of Microsource Financial of Watertown, Mass., which retails hardware and software primarily to corporate accounts, said he, too, was not entirely pleased. The Apple ads, he said, were a success, but those for Symphony from Lotus "missed the mark not by a mile but by a light-year." Their biggest shortcoming, he claimed, was that they "did nothing for store traffic" and made no tie-in with Lotus dealers.

Uncertain of any impact

Many micro managers said they were uncertain that the ad blitz was having any impact on their users. While acknowledging that "I don't think you can watch an hour or so of prime-time television and not see commercials for hardware or software," said Gene Maiman, project manager for microcomputers at Columbia Pictures, Inc.'s New York office. "It's really hard to trace the original source of where the user got that product idea."

More and more users are coming to him asking for products by their brand names, but, Maiman said, this could be because users have become more sophisticated, an idea supported by Ron Jenks, director of information services at Touche Ross & Co., a New York accounting firm. Jenks said his firm's users were already knowledgeable about microcomputer hardware and software because micros have been in use there for between four and five years, and a personal computing newsletter has been circulating among the users for the past three years.

What may be the bigger concern for microcomputer managers, Pratt & Whitney's Goldfarb pointed out, is the question of what to tell the users when they ask for a product by name, only to find that it is not supported by the firm. This, he said, was exactly what happened when his phone was ringing off the hook with users who wanted Lotus' Symphony. Symphony, he said, had already been tested by his office and found to be too difficult to use. But what to say to the users who wanted to move up?

Goldfarb said he told them: "Trust me, guys, what you're using now is better."

Whether you want to rent, lease, or buy, we have the financing options to fit your needs. We also stock a broad inventory of products, so you can have exactly the equipment you need without waiting. And we back up every shipment with total product support, including maintenance and prompt follow-up on any problems or questions.

If this sounds like the kind of service you want, call us today for the office nearest you.

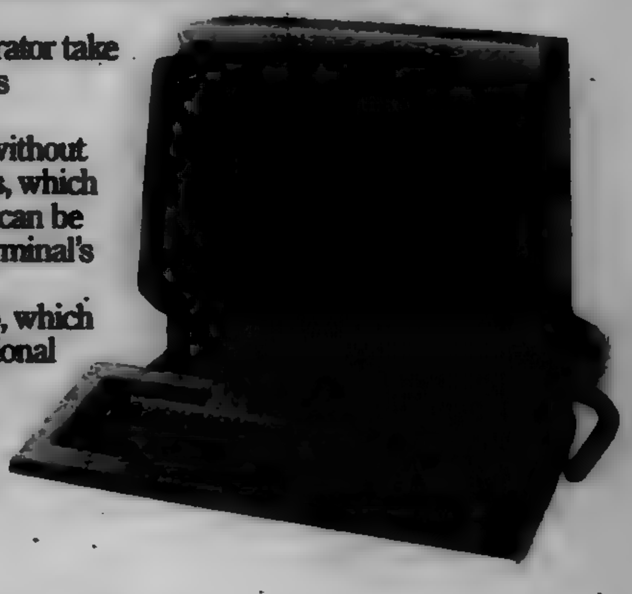
OUR WINDOWS OPEN A LOT OF DOORS.

Introducing the 5425 terminal from AT&T Teletype Corporation. It's the most highly featured ANSI 3.64-based terminal we've ever built.

Start with the 5425's windowing capability. Then add the fact that it's a general purpose editing terminal that's compatible with many computers such as VAX* and AT&T's new 3B series, and you'll see why it's such an outstanding value.



The nicest thing about the windowing feature is that it lets the operator take better advantage of multi-tasking capabilities of operating systems such as UNIX* System V.

As if that's not enough, the operator can do full-screen windowing without changing a program to fit the screen. At the same time, two more windows, which can overlap and vary in length and width, can be opened. The screen also can be divided into four independent windows which act as viewports into the terminal's 9600 character memory.

With 38 downloadable function keys and 16 screen labels, the 5425, which is also VT102* compatible, opens new levels for productivity. And the optional integrated intelligent modem features five programmable autodial keys to speed the dialing and logon functions. The modem also permits remote transmission from a standard phone jack.

If you want to open new doors in your career, look into our 5425. It'll make you look good. For more information, write AT&T Teletype Corporation, 5555 Touhy Ave., Dept. 3223-F, Skokie, IL 60077. Or call 1 800 323-1229, ext. 801.

DunsPlus: The Micro Solution That Reflects The Way You Do Business

You've heard the buzzwords: user friendly, integrated, smarter, faster, cheaper. But when you push the rhetoric aside you're still asking the same question, "Why can't I get a system that solves more problems than it creates?"

You can. It's called DunsPlus and it's built to respond to your information-related business demands without creating demands of its own.

DunsPlus gives the IBM PC XT a built-in business environment. This lets you mold DunsPlus to fit the way you do business.

Within the DunsPlus environment is a software base of the best. Lotus, MultiMate, Western Union electronic mail (to name but a few), are all ready for immediate use. But additional programs to solve your unique problems can also be added with ease.

Instant, yet controlled, access to your choice of mainframes and subscription databases is also a part of the DunsPlus environment. And transferring data throughout the system is as easy as moving a piece of paper from the In Box to the Out Box.

Immediate end-user productivity is not an issue: DunsPlus is a menu-driven system requiring minimal keystrokes for maximum results.

Installation is not an issue: DunsPlus is installed by IBM.

End-user training is not an issue: Training and support are part and parcel of DunsPlus.

Flexibility is not an issue: Any part of the DunsPlus solution—hardware, software, or service--can be tailored to meet your precise business needs.

In fact, there are no issues. DunsPlus does what you want, the way you want it--now.

Designing systems that reflect the way you do business is business as usual for us. NOMAD2, the premier 4th-Generation-Language/DBMS from D&B Computing Services, has made us a leader in the field of information management services. And as your needs evolve, so do we. DunsPlus is just the latest step in translating technological advances into usable business tools --tools that reflect the way you do business.

OA not justified solely on investment return

Cost reductions that accrue, improved decision-making methods should interest execs

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — Justifying office automation by an economic return on the investment alone is myopic, said Tom K. Lewis, the White House director of automated systems. In fact, the intangible benefits of automating an office are almost impossible to measure before a system is installed.

"Return on Investment is probably one of the least significant aspects when you are considering OA," added Lewis, who successfully introduced OA to the White House in 18 short months, where now 10 top assistants to the President are devoted terminal users.

Lewis, along with Jeffrey Borrer, vice-president and manager of decision support at First Boston Corp. addressed a session at the recent Federal Office Automation Conference, and both agreed on the difficulty of accurately assessing what kind of economic return there will be on OA hardware, putting micros on managers desks and establishing communications links to mainframe data bases.

However, when a strategic planner is hard-pressed to justify to top management exactly what benefits will result from spending resources to automate, the two MIS strategists suggested similar approaches.

First is the probability that there will be cost reductions that accrue from automation. Automating can cut labor costs, reduce time expenditures, average equipment costs and ultimately save financial resources that would otherwise have been spent. Second, improving the methods of decision making through automation can also be another unquantifiable factor that will justify an investment in OA.

According to Lewis, the vast majority of benefits derived from OA cannot be quantified, since they vary according to each environment. However, "the benefits are more likely at the lower end of an organization than at the top or more strategic level," Lewis said.

In the long run, Lewis said, selling OA solely on its return on investment will not justify its costs. Rather, it is better to sell it as a strategic asset. "What will happen if I don't automate," is a good question to pose to financial management, he said.

Jeffrey Borror, First Boston's manager of decision support, recommended an approach to selling OA that is different from one that most managers working in the U.S. government could be expected to follow — akin to a guerilla approach.

"Go after the senior top executives first. Preferably the younger ones. Don't push, but pick a key target, someone who is interested in the technology for starters. Have some specific applications and solutions that the OA will address. Then you got credibility," Borror suggested.

Finally, Borror recommended that you supply an integrated OA system initially that pulls together the software, micros and mainframes.

Seromda '85 meet set for Nashville

NASHVILLE — The Southeastern Regional Office Machine Dealers Association, Inc. (Seromda) is holding its 1985 convention, Seromda '85, at the Opryland Hotel here using the theme "Keepin' the Tune" from Jan. 31 to Feb. 2.

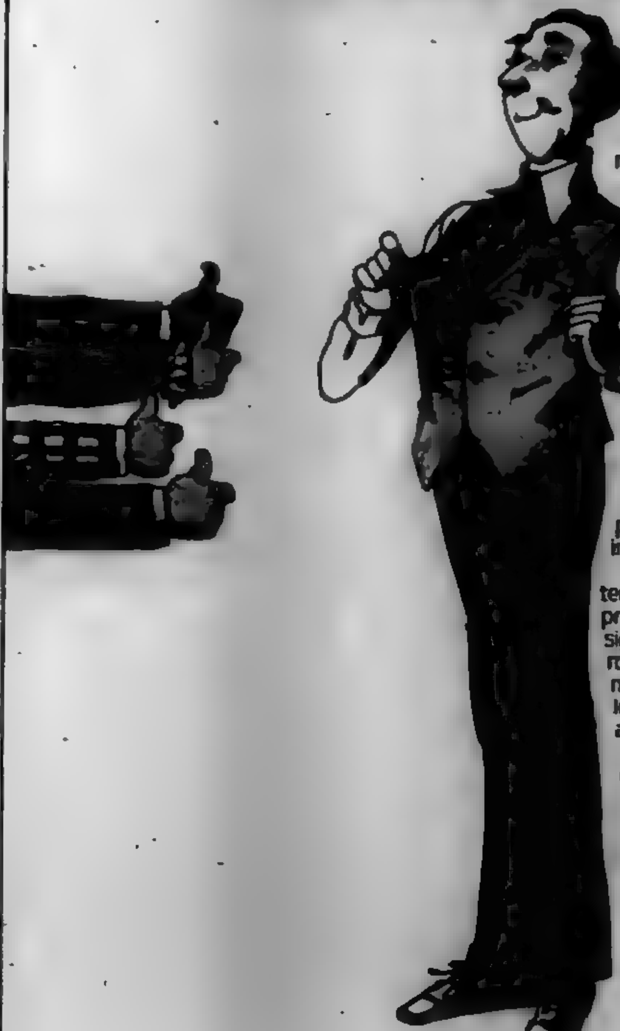
Aimed at dealers and manufacturers, the convention will feature exhibits and seminars. The keynote speaker will be Tom Hopkins, author of *How to Master the Art of Selling*, who will address the concerns facing office sales representatives every day and techniques and strategies for meeting the concerns.

Other speakers include Richard Flint, who will address management philosophies, understanding and implementation and ideas on how best to work with employees; attorney Robert C. Goldberg, an authority on trade regulation who is affiliated with Schoenberg, Fisher & Newman, Ltd. of Chicago, who will address contracts, warranties, dealer litigation and employee relations; and Don Chilton, president and founder of Sales Developers of Smyrna, Ga., who will address how to establish a sales program for office machine dealers.

Advance registration is $100 for members and $150 for nonmembers. After Jan. 10, registration is $125 for members and $175 for nonmembers.

More information is available from Seromda, Suite 205, 5115 Maryland Way, Brentwood, Tenn. 37027.

EVEN IF YOU CHOOSE THE GENESYS HRMS FOR STRICTLY TECHNICAL REASONS, YOU'LL STILL LOOK LIKE A BUSINESS GENIUS!



Get your company's 401(k) up and running on time. Assure payroll that employees' paychecks will immediately reflect any changes in tax laws, benefits, or union settlements. Automatically generate all the reports required for government compliance, as well as all the information needed to respond to discrimination suits. And, they'll call you a business genius.

All it takes is Genesys. The human resource management system that shows you how to contain costs and add hundreds of thousands, even millions, of dollars to your company's bottom line.

Genesys is the only human resource management system to offer a comprehensive benefits module, as well as leading edge personnel and payroll packages.

Everything you need to manage your company's benefits program. Minority tracking. Employee promotions. Applicant control. Manpower planning. Training and development. Skills inventory. Budget analysis. And more

Genesys is available as a fully integrated system or in separate modules. With or without a production-oriented IMS/database system designed specifically for your IBM mainframe environment. It's also the only HRMS with electronic mail updates. Which means it'll take that much less time for management to see just how smart a businessman you are.

Genesys. It's more than an HRMS. It's a cost containment system that makes you look like a business genius.

Call or write today. Genesys. 20 Ballard Way. Lawrence. MA 01843. (617) 685-5400.

Human Resource Management
That Helps Your Bottom Line

Valid AI definition lost amid industry jargon

CW AT RPI AI MEET

FRAMINGHAM, Mass. — Artificial intelligence (n): the capability of a machine to imitate intelligent human behavior.

The above explanation, at least according to *Webster's Ninth New Collegiate Dictionary*, constitutes the strict definition of artificial intelligence. But as with any evolving and, unfortunately, overused high-technology buzzword, the term "AI" currently sports a widening variety of confusing and sometimes contradictory definitions.

"If you ask a number of people involved with AI for a definition of exactly what it is, you will probably get n-plus-one answers," Henry Eric Firdman explained recently to a gathering of computer industry and business executives. "There exists a lot of controversy and confusion about artificial intelligence today.

Firdman navigated the executives through a seminar here, sponsored by Rensselaer Polytechnic Institute, titled "Artificial Intelligence and Expert Systems: An Executive Briefing." Firdman is the president of Henry Firdman & Associates, an AI contracting and consulting firm.

What, then, does the term "artificial intelligence" really mean?

"I define an AI system as one that can do three things," Firdman said. "An AI system can acquire new knowledge by communicating to the external world and by inferring from its current knowledge. That communication could be facilitated through sensors, input devices or even another AI system.

"Second, an AI system can carry out goal-directed behavior if it is given a set of goals, strategies for achieving those goals and some adequate knowledge. Finally, it exhibits skill acquisition, meaning that it can improve its performance in certain problem domains based on its knowledge and previous goal-directed behavior experiences."

Firdman said current research undertaken in academia and industry has produced AI systems that exhibit partial capabilities in only one of those critical areas. But to date, he said, no system exists that can boast success in all three realms.

"If a system is truly an AI system," Firdman said, "it will be significantly different six months after you buy it. Thus, any AI product must, by its very nature, be sold as an unfinished product, so to speak."

To aid his listeners in understanding artificial intelligence, Firdman unraveled some of what he labeled the popular but incorrect definitions of AI. For example, he said, many researchers describe AI as the development of computer systems capable of mimicking human reasoning and perception.

"What is wrong with that definition," Firdman said, "is that we do not know much about the mechanisms of human reasoning and perception. In that light, AI is being explained through the unknown."

Others characterize AI as the processing of symbolic information such as concepts, knowledge and relations. "That definition lacks functionality," Firdman claimed. "It is also weak and overly broad. For example, word processing would fall into that definition because it is symbolic information processing. Also, concepts and relations are just particular cases of knowledge, and knowledge processing is by no means all that AI includes."

A third camp, Firdman explained, defines AI as the branch of computer science concerned with designing systems that exhibit the characteristics associated with intelligence in human behavior, such as understanding language, learning, reasoning and solving problems.

"What exactly does that mean?" Firdman queried. "Is solving partial differential equations an intellectual activity? Is human vision an intellectual one? What about driving a car?"

AIM elects top officers, sets board of directors

MONTEREY, Calif. — A. Paul Cox Jr., president and chief executive officer of Data Systems Corp. of Richmond, Va., was recently elected president of the Association of Information Managers (AIM) for 1984-85 at a meeting at the Hyatt Regency here.

Harvey Wilson, senior vice-president of Honolulu Federal Savings Bank in Honolulu, was elected vice-president of AIM.

Other AIM members newly elected to the board of directors include: Hosie Maxwell, president of Comac of Oklahoma City; Lawrence B. Morse, president and chief executive officer of Northeast Datacom, Inc. of Wallingford, Conn.; David M. Tallcott, president of Mutual Thrift Service Center, Inc. of Albany, N.Y.; and Clyde Tew, senior vice-president of Frontier Federal Savings in Ponca City, Okla.

One-year term

The president and vice-president are elected for one-year terms, and board members serve three-year terms.

AIM, an affiliate of the Financial Managers Society, Inc., is a professional society for people responsible for information in federal institutions or financial institution service bureaus.

Additional information on the organization is available from Dick Yingst, Financial Managers Society, Inc., Communications Dept., Suite 2221, 111 E. Wacker Drive, Chicago, Ill. 60601.

Speaker: Develop strategic plan for adopting AI

CW AT
RPI AI MEET

FRAMINGHAM, Mass. — Dr. Henry Eric Firdman likes to tell the story of the Soviet researcher who approached the Ministry of Research and Development seeking funding for his pet project.

After explaining the nature of his undertaking, the researcher was asked, "Has the U.S. done any research in this area?" After the scientist expressed his excitement over the fact that he alone was working on such a project, the minister of R&D flatly replied: "No funding. We will not appropriate any money if the U.S. is not interested in this technology."

The anecdote is more than just an insight into what Firdman described as the workings of the Soviet system. Too often, he told attendees at a recent seminar here titled "Artificial Intelligence and Expert Systems: An Executive Briefing," sponsored by Rensselaer Polytechnic Institute, that U.S. corporations take a similar approach to new technology: If the competition is not looking into it, why should we?

Firdman, president of the AI contracting and consulting firm Henry Firdman & Associates, said management would be unwise to adopt such an outlook toward the fledgling technology of AI. He told his audience that AI can help a firm solve its strategic problems through innovative solutions that can also provide leverage over competitors. But to make use of AI technology, management must first draw up a strategic plan.

Components of plan

What are the components of such a plan? "Define your strategic goals first, then determine how AI technology can help you achieve them," Firdman instructed. "Separate your long- and short-term goals, because AI will affect them differently. Do not get involved in the so-called 'most promising' areas of AI, unless you have a strong scientific or technological backlog and the proper resources to address such a backlog."

Firdman advised management to organize a special in-house task force, possibly assisted by an outside consultant, composed of people with a broad knowledge of AI and an understanding of the human factors, such as fear of job loss, that are involved in the adoption of AI technology. The task force should review the company's operations for major problems, or bottlenecks, that an AI application could solve. The team should then choose one or two of the bottlenecks as "test beds" and outline the resources needed to undertake the AI application and the expected results of the test project.

"Figure out the return on investment you expect from any test bed project chosen, then decide whether it is worth undertaking," he said. "If the answer is 'no,' you have at least acquired new, objective knowledge about your organization obtained from a specific viewpoint. If the answer is 'yes,' you will have avoided the situation of hiring people [AI consultants or researchers] needlessly."

Firdman said that his research into corporations that have undertaken internal AI projects has pointed out three major lessons other companies would do well to learn. First, AI must have what he called "internal champions" among top management or plans and projects may wither on the vine. In addition, Firdman said that the selection of the first AI application is crucial to the success of a firm's entire foray into that new technology.

"The answer to the criticism that AI people do simple things with very complex tools," he said, "is that they want to survive to do more complex things in the future."

Finally, the AI decision-making process must be adapted to the company's corporate culture.

The following are some of Firdman's other tips for making an internal AI venture successful:

- If your task force cannot explain to you in plain English what you should be doing and with what end in mind, it is not worth doing.
- You must know exactly what you want to do before you hire an AI project manager.
- Use external consultants not only as members of the task force but as external auditors during regular project reviews.
- Do not be hesitant about closing down a project if it is not advancing in the right direction.
- When a prototype AI system is developed, use expert judges to assess its performance, and test the prototype in the field as extensively as possible.

"I have no doubt that in the long term an investment in AI is a good thing," Firdman said. "AI is like the research undertaken into nuclear physics in the 1940s. No one understood the importance of what all those scientists were working on in the desert. Then one day they saw the mushroom cloud, and they all understood."

N.Y.-area banks to tie ATMs into single net

By James Connolly
CW Staff

NEW YORK — Eight New York-area banks plan to link their 750 automated teller machines (ATM) into a single network that would let their customers withdraw cash from any of the banks' teller machines.

The network, which the banks hope to expand throughout the Northeast and into Florida, is being tested now and will be operating by the end of 1984, pending approval by the Federal Reserve Board.

The operating group, the New York Switch Corp., plans to offer the services provided by national shared networks on a metropolitan basis. A spokesman for the company said 30 more financial institutions have expressed interest in the network.

The eight founders include the Bank of New York; Barclays Bank of New York, N.A.; Chemical Bank in New York; Manufacturers Hanover Trust Co. in New York; National Westminster Bank, U.S.A. in New York; Goldome Bank and Marine Midland Bank, N.A. of Buffalo, N.Y.; and Union Trust Co. in Connecticut.

"The idea appeals mainly to commuters — people who may live in [Westchester county in New York] and commute to [New York City]. They will have the benefit of using Bank of New York machines in Westchester and the benefit of Chemical Bank or Manufacturers Hanover in the city where they work," said Alan Pohlman, a spokesman for New York Switch.

Leonard E. Malkin, chairman of the steering committee for New York Switch, estimated that the participating banks have 2½ million proprietary ATM access cards and more than two million ATM-qualified Mastercards and Visa cards outstanding.

Pohlman said the links among the banks will be through a Timeplex Corp. multiplexer marketed by AT&T Information Systems and installed in New York Switch's Fort Lee, N.J., headquarters. Each bank's ATM processors will have dedicated 2,400 bit/sec lines to that multiplexer, which will be connected by 9,600 bit/sec dedicated lines to a switch in New Berlin, Wis. That switch, consisting of Tandem Computers, Inc. Nonstop II and TXPs, is operated by A.O. Smith Data Systems, which developed the software for the switch.

When a customer begins an ATM transaction, the ATM's host processor will detect whether the customer's access card is from that bank or another participating bank. If it is another bank's card, the transaction will be routed to Fort Lee and on to Wisconsin, where the Tandem will identify the appropriate bank and, again through Fort Lee, query that bank as to the account status.

The customer's own bank can approve the withdrawal and record it in the same transaction. The approval is relayed back through the Tandem, and the cash is dispensed. Pohlman said the entire process should take about five seconds longer than with the previous systems, where customers could withdraw cash only at their own banks.

The system will not allow customers to make deposits or payments at banks other than their own.

System check ends search for terrorists

By Donna Raimondi
CW Staff

A gang of alleged terrorists — subjects of an intense nationwide manhunt for years — were flushed from their hideouts earlier this month after police officers did a simple computer cross-match that revealed the group's location.

Federal agents in Ohio arrested five fugitives with a long history of political terrorism, bank robbery and murder after a license check by Massachusetts State Police turned up an alias used by Patricia Gros — wife of alleged terrorist Raymond Luc Levasseur — who was wanted for questioning in the brutal Dec. 1981 murder of a New Jersey State Trooper.

Massachusetts State Trooper Richard J. Barrett said police came up with an alias that was eight or nine years old by following leads. An ex-neighbor of Gros' in Connecticut remembered that seven years ago Gros was in an accident when she lived in that state, and a check of Connecticut license files showed the same name and date of birth information as one of Gros' known aliases, he said.

Massachusetts State Police Cpl. Frederick J. Roberts said the information was entered into the Massachusetts Law Enforcement Agency Processing System, which runs on a Burroughs Corp. B7900 mainframe with approximately 300 of the state's towns linked via terminals. The alias information was then run through the computerized records of several states, turning up again in New York and finally in Ohio, Barrett said.

Gros' alias had been lifted from the records of a baby who died in Lowell, Mass., around the time of Gros' own birth, Barrett said. Even though Gros changed her name many times since becoming a fugitive, she kept the license alias the same throughout her stay in Connecticut, New York and Ohio, where she and her gang were picked up.

Lt. Joseph Kobus of the New Jersey State Police said that, following the murder of trooper Philip Lamonaco in 1981, more than 250 troopers searched for members of the gang. Task forces from the New England states and New York had been searching for members of the gang since 1977.

Q: How Many People Are Afraid Of Your 4-GL/DBMS?

A: None, If You Have EZNOMAD.

That's right. EZNOMAD is a major extension of NOMAD2 that pulls novice and infrequent end-users into the mainstream of mainframe computing. EZNOMAD's screen-driven environment requires no key words, system commands, or knowledge of syntax for operation.

With EZNOMAD, your end-users can sit back and follow a series of English-language instructions, menus, and pick-and-point screens. Now, those busy "management types" who "never have the time" to learn mainframe computing don't need to take the time. Infrequent users no longer need to "relearn" the system every couple of months.

EZNOMAD's micro-like capabilities access essentially all of the functions and power of NOMAD2. Imagine a senior manager in your company developing databases, creating applications, maintaining databases, and writing ad hoc reports — without your help.

Your senior management will not only be pleased with the capabilities of EZNOMAD, they will also be delighted with the cost of EZNOMAD—it's free to all NOMAD2 licensees.

In other words, you get the ease-of-use of a micro and the tremendous power and flexibility only a mainframe can deliver. And the price is right.

It's nice to know that when you pick NOMAD2 as the 4-GL/DBMS for your company, EVERYBODY will know first-hand that you've made the right choice.

EZNOMAD is the latest innovation in end-user computing from Dun & Bradstreet. NOMAD, now NOMAD2, has evolved over the years to keep pace with the demands for providing business professionals with maximum computing power. EZNOMAD is a major stride in that direction.

System integration vital to role of MIS exec

CW AT ENTERPRISE INFO SYSTEMS

By Kathleen Burton
CW West Coast Bureau

SAN DIEGO — Without more sophisticated systems integration between mainframes, microcomputers and minis, the MIS director's task of "having the right information in the right place at the right time is an impossible job." The multivendor environments that exist in Fortune 1,000 companies today make integration both inevitable and necessary during the 1990s, Robert T. Fertig, president of Enterprise Information Systems, Inc., of Greenwich, Conn., said in his keynote address at the sixth annual Enterprise Information Systems Forum held in San Diego this month.

Two key benefits to integrated systems, he said, are the ability to share critical resources and information and the elimination of unnecessary barriers to the free flow of information.

> *Electronic mail applications are limited by the lack of graphics support and by the technical naivete of companies becoming involved in the technology.*

Future operating systems will be the most suitable place for integration to occur, Fertig said, and next-generation operating systems should provide facilities for integrating data bases, data communications devices and graphics. Of the many stand-alone operating systems, integrators and operating system extensions that exist in the marketplace today, (including Apple Computer Corp.'s Lisa, Visicorp's Visi On and IBM's Topview), the Windows operating environment from Microsoft Corp. has emerged as the de facto standard for intramachine integration, Fertig said. Windows has been adopted by IBM, Digital Equipment Corp., Xerox Corp., Apollo Computer Corp., Digital Research, Inc. and other manufacturers, largely because it permits data to be viewed concurrently, he said.

During the remainder of the 1980s, there will be a proliferation of more sophisticated micro-to-mainframe links, Fertig said. These links will lower systems costs, provide higher productivity through faster response times, allow greater integrity of messages and superior security, decrease telephone and host connect times, coordinate CPU access with periods of low host utilization and enable the host to support increasing numbers of remote sites.

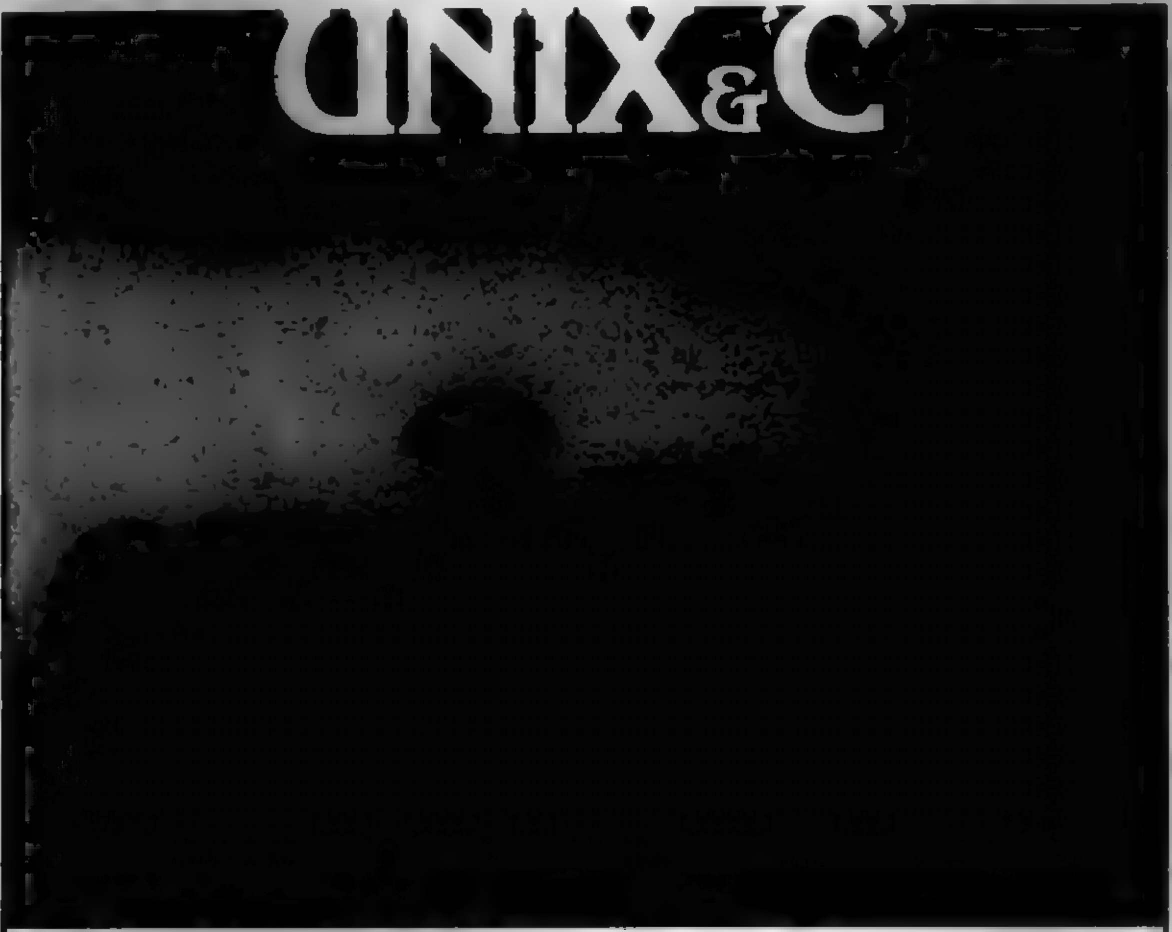
Presently, there are four viable software technologies for micro-to-mainframe links, Fertig said. These are terminal emulation, file transfer, electronic mail and distributed data processing. According to Fertig, electronic mail applications are still limited by the lack of adequate graphics support and because of the diversity and technical naivete of companies becoming involved in the technology — from small independents and public utility companies to conglomerates like MCI Communications Corp., Western Union, Inc. and GTE Telenet Communications Corp.

Interface consistency

"A key [criterion] necessary to integrate distributed data applications is developing interface consistency that is independent of its location," Fertig said. "Both ends of the link should have a consistent user interface and be able to run identical equipment at both ends of the link." So far, this has not been achieved, he said. An IBM Personal Computer XT/370 running IBM's Ramis/II or Information Builders, Inc.'s PC/Focus software, coupled with an IBM VM host, would provide today's optimum distributed solution, Fertig said.

A critical problem that has until now prevented development of commercial distributed applications for intermachine and intramachine integration, he said, is the "layer six problem." (Layer six is the presentation layer of IBM's Open Systems Interconnect architecture that translates information between incompatible formats.) Layer six format translations are usually less than 70% accurate, Fertig said, resulting in serious degradation of source data during transmissions. It is possible to solve the problem, Fertig said, by using format translations to map data exchanges between incompatible systems or by sending rules and data simultaneously.

Offering the best solution to date, Fertig said, IBM has developed three architectures — the Document Interchange Architecture, Systems Network Architecture and the Document Content Architecture — that "act as a glue" to solve portions of the integration problem.



MANY UNIX-BASED SYSTEMS
ONE UNIX TRAINING COMPANY

The Computer Technology Group provides the UNIX training solution. Training to fit the complexities of your UNIX-based system.

Three factors make the Computer Technology Group the experts in UNIX and 'C' language training:

- Experience, through training thousands of students worldwide in live seminars, with thousands more using our video training at their own locations.
- Extensive Curricula Supporting All UNIX Versions, creating a client base of manufacturers, software developers and end users.
- Quality of Instruction, with instructors and course developers who are experts in teaching UNIX and 'C', as well as in designing and implementing a variety of UNIX-based systems.

ONE UNIX TRAINING COMPANY
MULTIPLE DELIVERY SYSTEMS

Whether you're training two, 200, 2000... you can select the most efficient and economical training solution for your unique environment:

- Public Seminars offered in major cities throughout the world.
- On-Site Seminars for training customized to your system and to specific groups within your organization.
- Video-Based Training for convenient training that is always available at your location.
- Interactive Videodisc Training, which dynamically tailors courses to the individual—from novice to expert programmer.

CONDUCTOR: The MIS Approach to End-User Access

Today—end-users need greater access to data. And MIS needs better control. To solve both problems, TSI introduced CONDUCTOR.

CONDUCTOR lets end-users get the data they need. CONDUCTOR selects, manipulates and delivers data to any end-user environment. Without programming. And CONDUCTOR gives MIS more control than ever over quality and integrity, with a new degree of security.

While others have tried to solve the end-user problem, they've only addressed a small part. CONDUCTOR goes for the big picture. So remarkably different, there's virtually nothing else like it.

CONDUCTOR is the latest innovation in software from Dun & Bradstreet. As such, it joins NOMAD, now NOMAD2, the premier 4-GL/DBMS from D&B Computing Services, and DunsPlus, the "people literate" microcomputer that reflects the way you do business.

Find out about TSI's CONDUCTOR today. We're sure you'll like the way it helps you CONDUCT business.

TSI International:
Innovations In Managing End-User Computing From Dun & Bradstreet

Computer collects campus crime statistics

By Donna Raimondi
CW Staff

ALBANY, N.Y. — Crime reporting requirements in the state of New York recently served as a vehicle to test the state university's new data base management system (DBMS) and fourth-generation language.

The State University of New York (Suny) is comprised of 375,000 students and 40,000 employees dispersed throughout 29 campuses all over New York. To keep track of crimes on the various campuses, Suny security staff members send crime data to the state computer center in Albany, said Tom Rysedorph, assistant director for systems development at the Research Foundation at Suny-Albany.

The computer center processes the information and forwards it to the state's criminal justice department once a month to satisfy state crime statistics requirements, he said.

Suny's security officers had never used the university's computer facility, which runs an IBM 3033 under MVS/CICS, Rysedorph said. When the university acquired an Applied Data Research, Inc. (ADR) Datacom relational DBMS and ADR's Ideal language this year, security requested a new crime reporting system that would allow its officers to enter data interactively and to generate ad hoc reports for its own use as well as the statistics for the criminal justice department, he said.

With the old system, security staff members filled out paper forms and forwarded them to punch card/data entry staff at the computer center in Albany, which collated the information on tape, put it through several batch programs with interim edit/audit lists and returned the tape to the security director for error checks, Rysedorph said. Once corrected, the tape was sent on to the criminal justice department, he said.

Exercising options

Members of Rysedorph's group looked at the request for a new crime package as a pilot to help them fully understand the new products, he said. "We wanted to exercise all the options and alternatives available to us and throw in all kinds of problems in order to adapt to users' needs as they become more sophisticated," he said.

The ADR system had been acquired after a search of other DBMS, Rysedorph said. "We felt that [IBM's] IMS belonged to major corporations with data base staff in the hundreds and multiyear development cycles," he said. Cullinet's IDMS needed a highly technical data base administrator, he said. "It is very hard to obtain data administration at a high level given the salaries of state employees," he added. For the Datacom relational DBMS, the data base administration is less technical, more administrative and more user-oriented, he said.

The fiscal constraints of the university also had a lot to do with the Crime Incident Reporting package's design, Rysedorph said. Little money is available for training, and New York's snowfall will make it difficult for users to travel to the center in Albany for training, he added.

"We placed procedures into Help panels that users can access by hitting a function key when they get an error message. We also provided a function where they could hit a button and get all the errors found on a screen," said Ralph Bennett, senior project leader.

Bennett trained personnel from three pilot campuses in Binghamton, Canton and Potsdam and found that training in the application itself was easy, he said, but familiarizing the staff with computer use in general was difficult. "They got hung up on getting their passwords in correctly," he said, and they had some problems figuring

See SUNY page 35

IBM 3270 users: you can
the mini/micro universe

Click. Flip the switch on the Matchmaker 2000 and your 3270 terminal thinks it's a VT-100. Now you can communicate with a micro or mini computer. Access data networks such as Dow Jones and The Source, as well as local area networks, such as Net One. Send and receive electronic mail. Now the whole universe of ASCII is open to you.

Click. Flip the switch back to 3270 mode and the Matchmaker 2000 "disappears." You have a transparent path from your terminal to your IBM cluster controller. And there's no interference with the flow of data. No loss of speed. No reduction in capability.

$695. The Matchmaker 2000 is the enhancement for 3270 type terminals that allows them to emulate VT-100, ADM-3A and other types of ASCII terminals and to access a wide range of mini and micro computers. DEC. Hewlett-Packard. Data General. Prime. Texas Instruments. And others. Access them directly. Or through a modem. Via data switch or PBX at speeds from 110 bps to 19.2 Kbps.

Plug-in installation between terminal and cluster controller is quick and easy. Operation is simple. A single switch takes you from 3270 mode to ASCII mode and back again. And the cost? Only $695.

IBM is a trademark of the International Business Machines Corporation. DEC, VT-100 are trademarks of the Digital Equipment Corporation. ADM-3A is a trademark of Lear Siegler, Inc. Computer counseling may reduce marital stress

By Donna Raimondi
CW Staff

MIAMI — To the list of dedicated ministers and psychologists who specialize in alleviating marital stress, add one Sperry Corp. computer.

Mathematicians at the University of Miami here are using modeling techniques to identify and prevent sources of conflict in a marriage, said Dr. Bernard Howard, professor of mathematics and computer science.

People are like black boxes; they have finite states that include input, internal and output states, Howard said. As a result of input, the internal and output states change, he added.

Howard and his affiliates have spent the last 15 years developing a system of pinpointing behavior, rating the behavior on indexes and identifying alternative actions that could act as a tool to help reduce stressful conduct, he said. The computer simulates the dynamic behavior of the system from all possible internal situations and displays a tree to show possible behaviors. It computes various indexes — strife, compatibility, acceptability — and gives a "batting average" from zero to 1,000.

Each member of a couple answers a set of eight questions that Howard and his team designed to reflect the internal state, he said. The computer then analyzes current behavior, and a psychologist validates the results. Once the analysis is accepted, an index is given and the computer searches through all possible changes each individual could make to increase successful conduct.

Howard and Dr. Henry Kunce — a former Presbyterian minister/counselor and now a behaviorist at the university — wrote 30 programs in two classes (discrete and continuous modes) to apply to interactive behavior. They tested their programs by running more than 300 cases Kunce had worked on in his counseling days through the system, and the computer simulated what had really happened in every one of those situations, Howard said.

Dr. Joseph Kunce, a psychologist at the University of Missouri, experiments on couples and gathers data, which Howard and Henry Kunce process on a Sperry 1100/82 mainframe.

His research team has experimented on corporate decision-making processes and racially tense political situations; the hope is to someday use the system for smoothing relations between world leaders, arbitrating labor conflicts and defusing racial conflicts, Howard said.

SUNY from page 34

out how to access their IBM 3101 or 3278 terminals via different control unit devices."

Another problem with training has been that the Justice Department insisted on 100% accuracy in the new reporting methods, and the security department was used to allowing errors they considered to be noncritical.

For example, said Platt Harris, director of university public safety, the only traffic violation allowed on the criminal justice report is driving while intoxicated, but the security department had previously included other traffic violations for its own information.

Now, everything has to conform to justice department rules, Bennett said, and it has taken the users a while to realize that they have a tool that will readily tell them what is unacceptable so they can fix faulty reports.

Rysedorph's group prepared itself to write the program by attending users group meetings in Boston, Toronto and upstate New York, and by talking frequently with ADR's technical support people.

UK firms plagued by misguided DP purchases

By Lisa Israel
Special to CW

LONDON — A subsidiary of a large UK manufacturing company spent two years developing a production and control system without producing a single working application.

The company's data processing department, which recommended a mainframe for the application, now recognizes that it made a mistake and has turned to a minicomputer to do a quicker and cheaper job.

According to Max Hand, a management consultant at the firm of A.T. Kearney, "Top and middle management should have controlled that project, not DP. If you leave it to DP, you will get the wrong solution."

Hand reached his conclusion after researching the use of information technology at more than 200 companies. Backed by the UK's Department of Trade and Industry and the Institute of Administrative Management, the research arrived at one horrifying conclusion: 20% of an estimated $5 billion to $6 billion in computer spending in 1984 will go to waste.

The study divided informaton technology users into "leaders" — companies that are coming to terms with information technology — and "laggers" — companies that leave themselves behind. The study found that only a quarter of the companies surveyed fit into the first category.

The rest are making all kinds of mistakes, according to Hand. "They are buying the wrong machines, spending too long or too much on developing systems and not getting the most from them when [the systems are] installed."

Hand tells hair-raising stories of money misspent at large and small firms in fields ranging from finance to construction to local government.

Hand places the blame firmly at the door of top management for not setting the right objectives for their DP departments. "Lagging companies do not really know what to do with technology. They don't understand it. It is almost an embarrassment to them, so they do the traditional, easy things," he said.

An example of this approach was used by one well-known construction company interviewed by Hand, which had all the right applications, but failed to win full benefits from automation.

The firm had put its accounts on computer, but still carried out its annual consolidation by hand. It also had a payroll package for several thousand employees but worked out some calculations manually. Employees were working as hard with a computer as they had without one.

"This particular company didn't know what the hell to do with information technology," Hand said. "The DP department was too busy responding to immediate requests. If they had sat back and thought about it, they could have automated functions on their construction sites."

Without confidence in its own judgment, top management shifts responsibility for DP decisions to DP managers, who then make the wrong decision. This is because DP managers do not always know the computer strategy that will best help a business, Hand maintained. "Nor should they be expected to; they are trained to find technical solutions, not to formulate business tactics."

Cost justification of computer-related projects is another problem for companies because so many of the benefits from computerization come in crossing intracompany barriers that managers find difficult to cross.

It is also a problem because savings are difficult to quantify from piggyback benefits like electronic mail or office automation. The survey estimates that confusion over job-costing can prevent firms from seeing more than 70% of the benefits of information technology.

Bouncing off a brick wall

Furthermore, even when DP managers recognize that computers are not being used to full advantage, bringing recommendations to the board's attention is like "bouncing off a brick wall," Hand claimed.

"DP managers do not always know how to put forward a business case for a better system. . . . In short, what the survey identifies is a gap between business strategy and computer policy."

Top managers need to change their attitude toward computers, Hand advised. "A system is not just a big box that maximizes staff productivity and saves on wage costs," he said, adding that the latter is the stated aim that outweighed all others for computerization by 80% of companies surveyed.

"Information technology must be aligned with a company's business strategy," Hand reiterated. "A firm must work out what it wants to do and then work out what it wants from information technology. This has got to be done by top management, and it's a strategy that can then be implemented by DP managers."

Standards directory out

WASHINGTON, D.C. — The National Bureau of Standards has issued a directory of standards developed by trade associations, technical and professional societies, federal agencies and state governments.

"Standards Activities of Organizations in the United States (SP-681)" summarizes the activities of more than 750 organizations in the U.S. as well as 420 private sector groups. The directory also contains a list of 632 nongovernment groups that develop standards, contribute to the standardization process or are sources of documents and information.

The standards directory, stock number 003-003-02602-6, is available for $13 prepaid from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Unix users meet set for January

DALLAS — Uniforum '85, the International Conference of Unix Users, will be sponsored by Usr/Group at Infomart here on Jan. 21-25, 1985.

Fourteen all-day tutorial sessions will be held on Monday, Jan. 21, and conference sessions are scheduled in four tracks: office systems, personal computers, engineering/programming and market trends.

Vendors of AT&T's Unix hardware, software and services will exhibit their products at the international event.

Registration fees

Registration prices are as follows: for the show only, there is no fee if preregistered, and registration is $10 on-site; for the tutorials, there is a $100 fee if preregistered and it costs $150 on-site; and the price for the conference is $125 in advance and $175 on-site.

Special conference rates apply for members and students.

More information is available from Uniforum, which is located at Suite 205, 2400 E. Devon Ave., Des Plaines, Ill. 60018.

VAX ALL YOUR FLOORS WITH SMARTSTAR

Get better decision-[illegible]
and a very profitable competitive edge [illegible]

What if everyone in your office were suddenly able to design their own applications, whether they know anything about programming or not? What if this left you and your computer professionals free to concentrate on really important jobs?

Well, this is exactly what SMARTSTAR does. It puts the power of the VAX at the fingertips of those who [illegible] how much or how [illegible] they know about programming. They get information fast. So they can make decisions fast. Productivity skyrockets. And so does profitability.

Programmers are relieved of the tedious jobs, the busywork—and most important, the backlog of programming jobs that will now be handled by end-users.

For complex applications, SMARTSTAR's structured interface and built-in callable routines reduce development time by a 10 to 1 ratio. Features like [illegible] SMARTSTAR [illegible] DEC's new VAX/[illegible] accounting [illegible]

CCA introduces the most effective solutions

Application development. End user computing. Office automation. These are probably the three hardest challenges facing every MIS department.

Now there's a way to crack all three. From CCA. With three of the most innovative solutions ever developed.

Only CCA could do it. Because CCA has 20 years experience in researching and developing software technology.

1. WORKSHOP/204. The single most powerful set of tools for crushing the application backlog.
Our new WORKSHOP/204 is a collection of integrated tools that is unparalleled for speeding up application development.

WORKSHOP/204 guides the developer through the entire process. Databases are designed automatically. Prototyping becomes a simple task with fill-in-the-blank forms. Screens and menus are "painted" with a powerful electronic palette. And the most complete application development language lets you add processing logic.

WORKSHOP/204 even allows a PC to be used as a development workstation. A dictionary drives the entire process and provides complete control and integration.

WORKSHOP/204 does all this in a fourth generation environment. And because it's interactive and menu-driven, it's also easy-to-use.

If you want to get complete applications online 5 to 50 times faster, WORKSHOP/204 is the way to do it.

2. INTELLIGENT INFORMATION CENTER. An integrated system for giving executives access to the database.
Business managers need useful information, not meaningless data. The INTELLIGENT INFORMATION CENTER is a complete set of tools that allows them to get what they need themselves. Without having to understand anything about mainframe technology.

The INTELLIGENT INFORMATION CENTER includes an easy-to-use PC/mainframe link that downloads data and creates spreadsheets automatically. There's also a powerful, menu-driven query and reporting system and a completely automated application generator. Plus interfaces to tie into other decision support systems. And a utility to quickly load data from commercial databases to your own. In addition there's an administrative tool that controls data access and documentation.

The INTELLIGENT INFORMATION

to today's three toughest MIS problems.

CENTER is the smart answer to automating corporate end-user computing needs.

3. PROD/NET. The only OA system that can integrate PC's, word processors, LAN's and hosts using existing hardware.

PROD/NET is the first and only system that lets you totally integrate office automation equipment and host computers into a single communications system. Using the hardware and technologies you already own.

No other product comes close to the completeness of PROD/NET. For one thing it lets you connect PC's into efficient local networks so they can communicate with each other, handle multi-tasking, and share expensive peripherals. It also allows documents to be translated automatically from one type of word processor to another. And host-based SNA communication transfers data between host terminals, word processors and the PC networks.

PROD/NET can give everybody in the office direct access to the corporate database. Probably no investment you could make will make your company more efficient and effective.

MODEL 204 DBMS. The kernel of a complete corporate information environment.

CCA's relational MODEL 204 is the fastest growing DBMS for IBM mainframes. It gives you productivity with performance, plus ease-of-use, efficiency, flexibility and capacity. Qualities that make it the perfect foundation for your corporate information system.

WORKSHOP/204. The INTELLIGENT INFORMATION CENTER. PROD/NET. MODEL 204 DBMS. Only CCA offers the total solution to managing the corporate information environment.

To get more information in your hands, please call **1-800-258-4100**. Or write Computer Corporation of America, Four Cambridge Center, Cambridge, MA 02142.

Foreign vendors showcase wares at Comdex

Japanese, Australian, English vendors highlight product introductions in '84

By Susan Blakeney
CW Staff

LAS VEGAS — Among the 1,400 exhibitors at the recent Comdex/Fall '84 here were several international vendors looking for customers, dealers or partners in the U.S.

Fujitsu Microelectronics, Inc. unwrapped its Micro 16SX, an Intel Corp. 8086-based personal business computer that features 384K bytes of random-access memory, a 10M- or 20M-byte built-in Winchester hard disk drive and a 360K-byte, 5¼-in. half-height floppy disk drive. The machine is also equipped with a real-time clock with battery backup, a serial communications port, a parallel port, a graphics subsystem and an eight-color monitor. The system can operate on Microsoft Corp.'s MS-DOS and Digital Research, Inc.'s CP/M 86 or Concurrent CP/M 86 operating systems, a spokesman added. Pricing on the Micro 16SX begins at $4,250.

Time Office Computers of Australia showed the Emu Ergonomic Workstation and the Kookaburra Portable Computer. The Emu was designed by Ferdinand A. Porsche's Design Studio to meet all presently documented ergonomic standards. The screen features six-directional motion and leaves no footprint on the user's desk as it is suspended by a moveable arm. The keyboard is sculpted and padded and comes complete with a hand rest bar. Pricing on the workstation starts at $5,000.

The vendor's Kookaburra machine is an Intel 80186-based, 9-lb system featuring up to 256K bytes of random-access memory, three ports, bundled MS-DOS 2.1, word processing, spreadsheet and diary software. The system can run on battery or main power supply. It costs $2,200.

Also from Australia was the Squirrel Ltd. Relational Database Management System, said to offer the same capabilities as IBM's SQL fourth-generation language to users of micros, minis and mainframes. The software also features data manipulation capabilities, security control and indexing and data definition facilities. Pricing starts at $2,400.

NEC Information Systems, Inc., the Boxborough, Mass.-based subsidiary of NEC Corp., unveiled an electronic mail system that enables up to 10,000 users of the vendor's Astra 300 VS series of 32-bit minicomputers to communicate with each other. Priced at $2,000, Astra Electronic Mail sends and receives messages within the Astra system from workstations, personal computers, portables and asynchronous terminals, according to the vendor. Multiple copies of up to 10,000 can also reportedly be sent to the system users.

Sony Corp. introduced its Compact Disk Read-Only Memory (CD ROM) product, which offers 540M bytes of memory on a single 4.72-in disk, which the company said has 500 times the capacity of conventional floppies. Digital encoding techniques combined with laser optical technology form the basis of the CD ROM format, originally devised in conjunction with Philips Information Systems, Inc. as a high-fidelity audio storage medium, according to a vendor spokesman. Sony intends to deliver samples of this product during the first quarter of 1985.

Sony also expanded its line of high-resolution Trinitron red-green-blue monitors. The additions included 9-, 12- and 13-in. screen models. All three are compatible with the IBM Personal Computer product line, and pricing starts at $550, the vendor said.

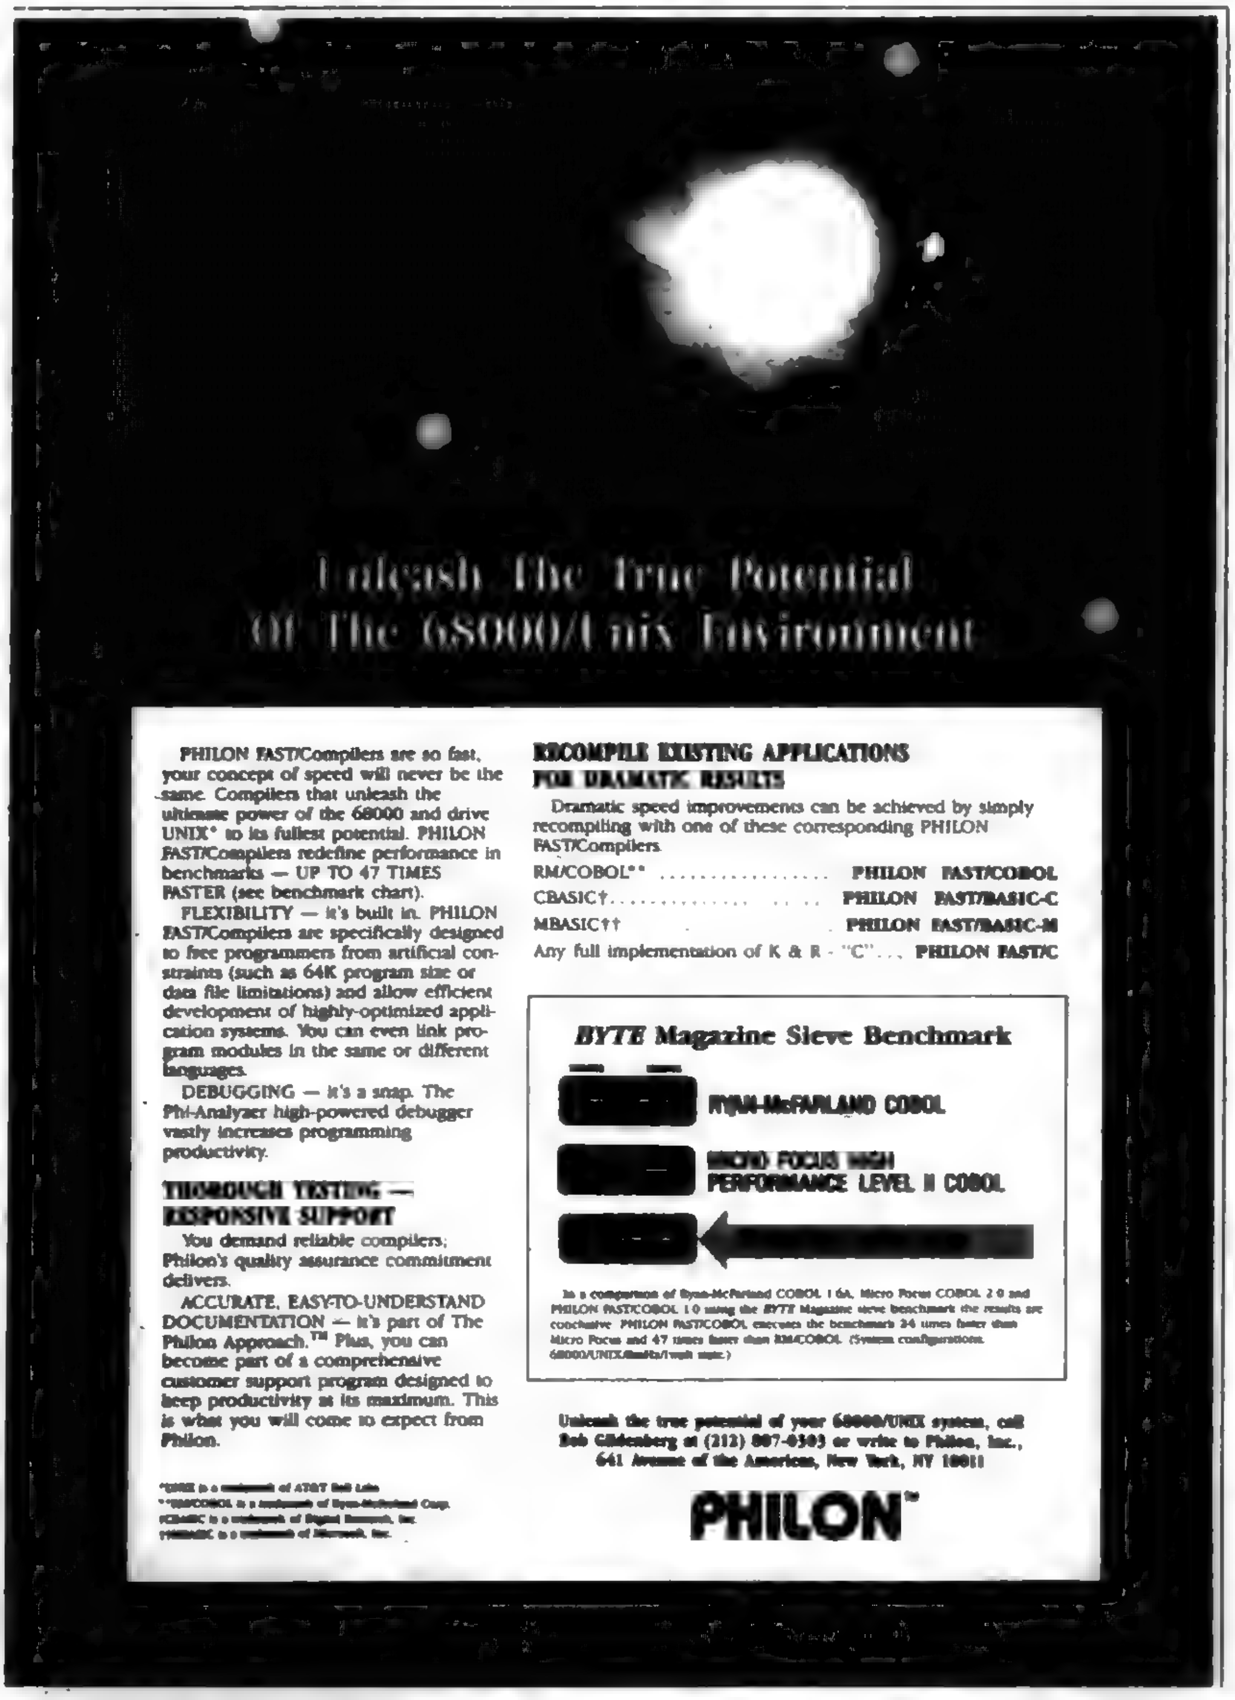
The UK's Newbury Data Recording introduced Penny, a 3½-in. fixed-disk drive offering 50M bytes of storage and an average access time of 40 msec. It costs $5,000 per drive.

Aimed at life cycle control

Introduced by Yard Software Systems Ltd., also of the UK, was Lifespan, an automated configuration management system. This product was designed to allow managers and developers more control over their software throughout its life cycle. Lifespan runs on Digital Equipment Corp.'s VAX line of machines using VMS. Lifespan does not require extra staff to implement, nor will it slow down the software development process, according to the vendor. It is priced at $19,000.

Apricot, Inc. of the UK unveiled the Apricot F1s, a 512K-byte version of its F1 entry-level business micro. With a price tag of $1,995, the F1s features an 8086 microprocessor, 512K bytes of random-access memory (RAM), expandable to 768K RAM, a 720K-byte, double-sided 3½-in. disk drive, infrared keyboard, color graphics and an optional mouse.

Apricot also introduced the Apricot Portable, a 13-lb system equipped with many of the same features as the vendor's F1 micro with the added features of voice recognition, infrared mouse and a full-size flat panel display. This machine costs $1,695.



PHILON FAST/Compilers are so fast, your concept of speed will never be the same. Compilers that unleash the ultimate power of the 68000 and drive UNIX* to its fullest potential. PHILON FAST/Compilers redefine performance in benchmarks — UP TO 47 TIMES FASTER (see benchmark chart).

FLEXIBILITY — It's built in. PHILON FAST/Compilers are specifically designed to free programmers from artificial constraints (such as 64K program size or data file limitations) and allow efficient development of highly-optimized application systems. You can even link program modules in the same or different languages.

DEBUGGING — It's a snap. The Phi-Analyzer high-powered debugger vastly increases programming productivity.

THOROUGH TESTING — RESPONSIVE SUPPORT

You demand reliable compilers; Philon's quality assurance commitment delivers.

ACCURATE, EASY-TO-UNDERSTAND DOCUMENTATION — It's part of The Philon Approach.™ Plus, you can become part of a comprehensive customer support program designed to keep productivity at its maximum. This is what you will come to expect from Philon.

RECOMPILE EXISTING APPLICATIONS FOR DRAMATIC RESULTS

Dramatic speed improvements can be achieved by simply recompiling with one of these corresponding PHILON FAST/Compilers.

Service is the cross you shouldn't have to bear.

It's the first promise made.

It's the last promise kept.

But today, service may well be the most important consideration in the computer buying decision.

It may also be the best reason to choose Wang.

Wang has more than doubled its field service and support staff in the last three years.

Wang has an ongoing, two-way dialogue with customers to keep them current and to respond to their changing needs.

Wang has designed its educational programs to not only fit the needs of every company, but to fit the needs of every person involved in office automation, from top management to end-user.

In fact, the way Wang looks at it, the more help we can give our customers, the more help they'll get from our computers.

WANG

We put people in front of computers.

Europe facing marginal technological growth

By George Harrar
CW Staff

AMSTERDAM — Where is the European computer market headed?

The words and tone of Vittorio Cassoni, vice-president of corporate marketing for Olivetti S.P.A., conveyed an unmistakable pessimism about the direction of the European market to the sparse crowd attending his Comdex/Europe keynote address here recently.

"Without a development in favor of the new technologies," Cassoni said, "the decline of Europe is destined to continue. . . . Europe will not be in condition to participate with full rights in the new development cycle. It will sink to an increasingly marginal technological and economic position."

Cassoni outlined what European companies must do to stay in the running in the technological horse race now dominated by the U.S. and Japan. But at few points did he sound convinced his prescription would be followed.

Do not worry about technological and productive autonomy, he told his audience, because European firms cannot succeed by going it alone or even by uniting their own forces. Agreements with Japanese and U.S. companies must be the means to active participation in the development of new technologies, he noted.

More than 200 such agreements have been concluded, Cassoni said, but in many cases the European companies are simply passive partners operating from positions of financial and technological weakness.

Venture capital could permit the birth and growth of small companies in Europe as it has in the U.S., he added.

Discord does not permit optimism

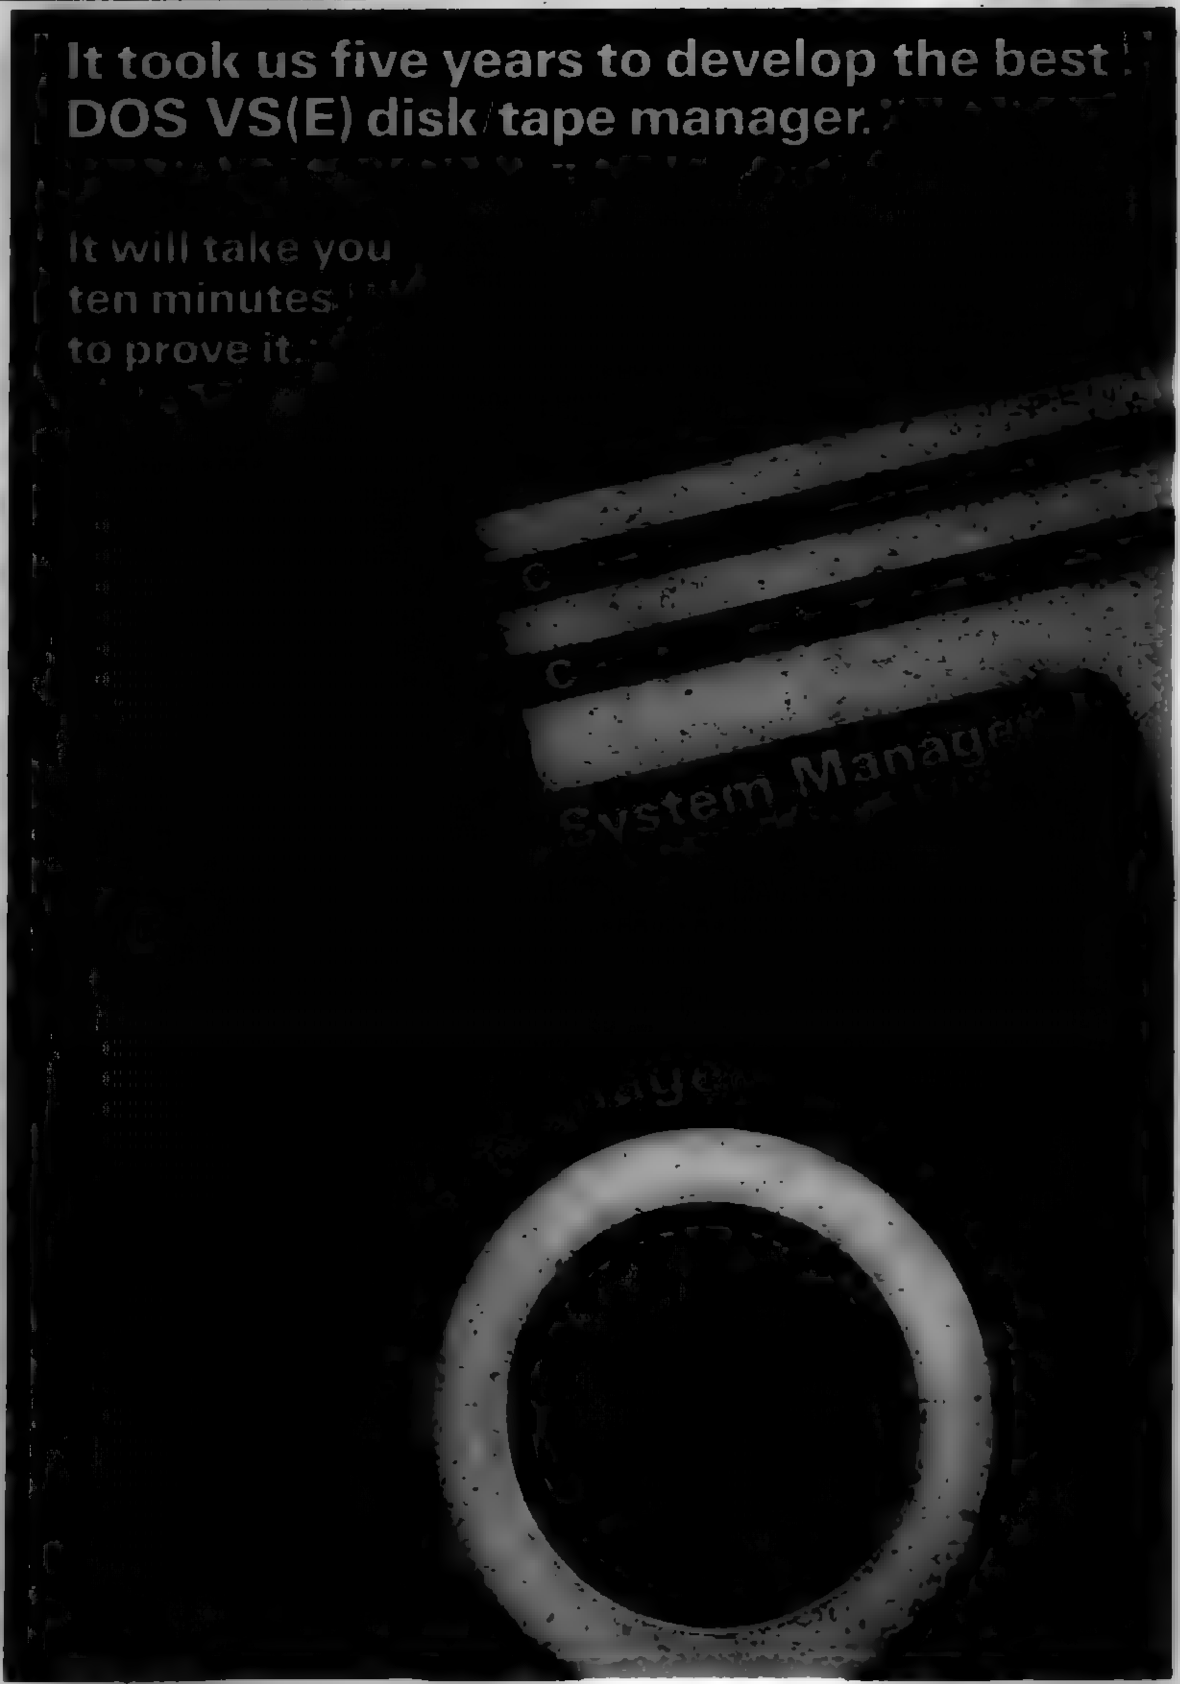
A strong home base for sales would strengthen European companies, and Cassoni called for a "more integrated and homogeneous" market. But he was bluntly realistic: "The political and economic discord that currently divides the European countries does not permit optimism on possible progress in the immediate future."

He cited figures illustrating the lack of dynamism in the European marketplace, both from user and vendor perspectives:

- At the end of 1983, an estimated one out of three U.S. white-collar workers used an office workstation, compared with one out of 12 in Europe.
- In the U.S., one in 10 white-collar workers uses a personal computer, compared with one in 30 in Europe.
- A European telecommunications company would need sales of at least $14 billion to reach typical profit levels, after an initial investment of $700 million to $1 billion to develop a new digital switch. That profitability would only be possible by the company's assuring itself of 100% of the combined digital switch markets of West Germany, Great Britain and France for the next decade.
- More than 80% of the companies controlling production in the information industry are U.S. firms, while 10% are European.

Cassoni concluded his lament about the European computer industry by describing a scenario in which Europe continues on its present course to becoming a marginal technological power. He ended by stating, "Let's hope it will not happen."

The third annual Comdex/Europe, which focused on small computer systems, had been expected to draw 10,000 visitors. The sponsor, The Interface Group, Inc., reported that 7,300 visitors attended.



It took us five years to develop the best DOS VS(E) disk/tape manager.
It will take you ten minutes to prove it.
System Manager

Author slated to address office expo

WASHINGTON, D.C. — Tom Peters, coauthor of *In Search of Excellence*, will address the Federal Office Systems Exposition at the Convention Center here March 6.

Peters will share his findings on revitalizing corporations, continuing innovation, enhancing customer satisfaction, improving productivity and implementing strategy.

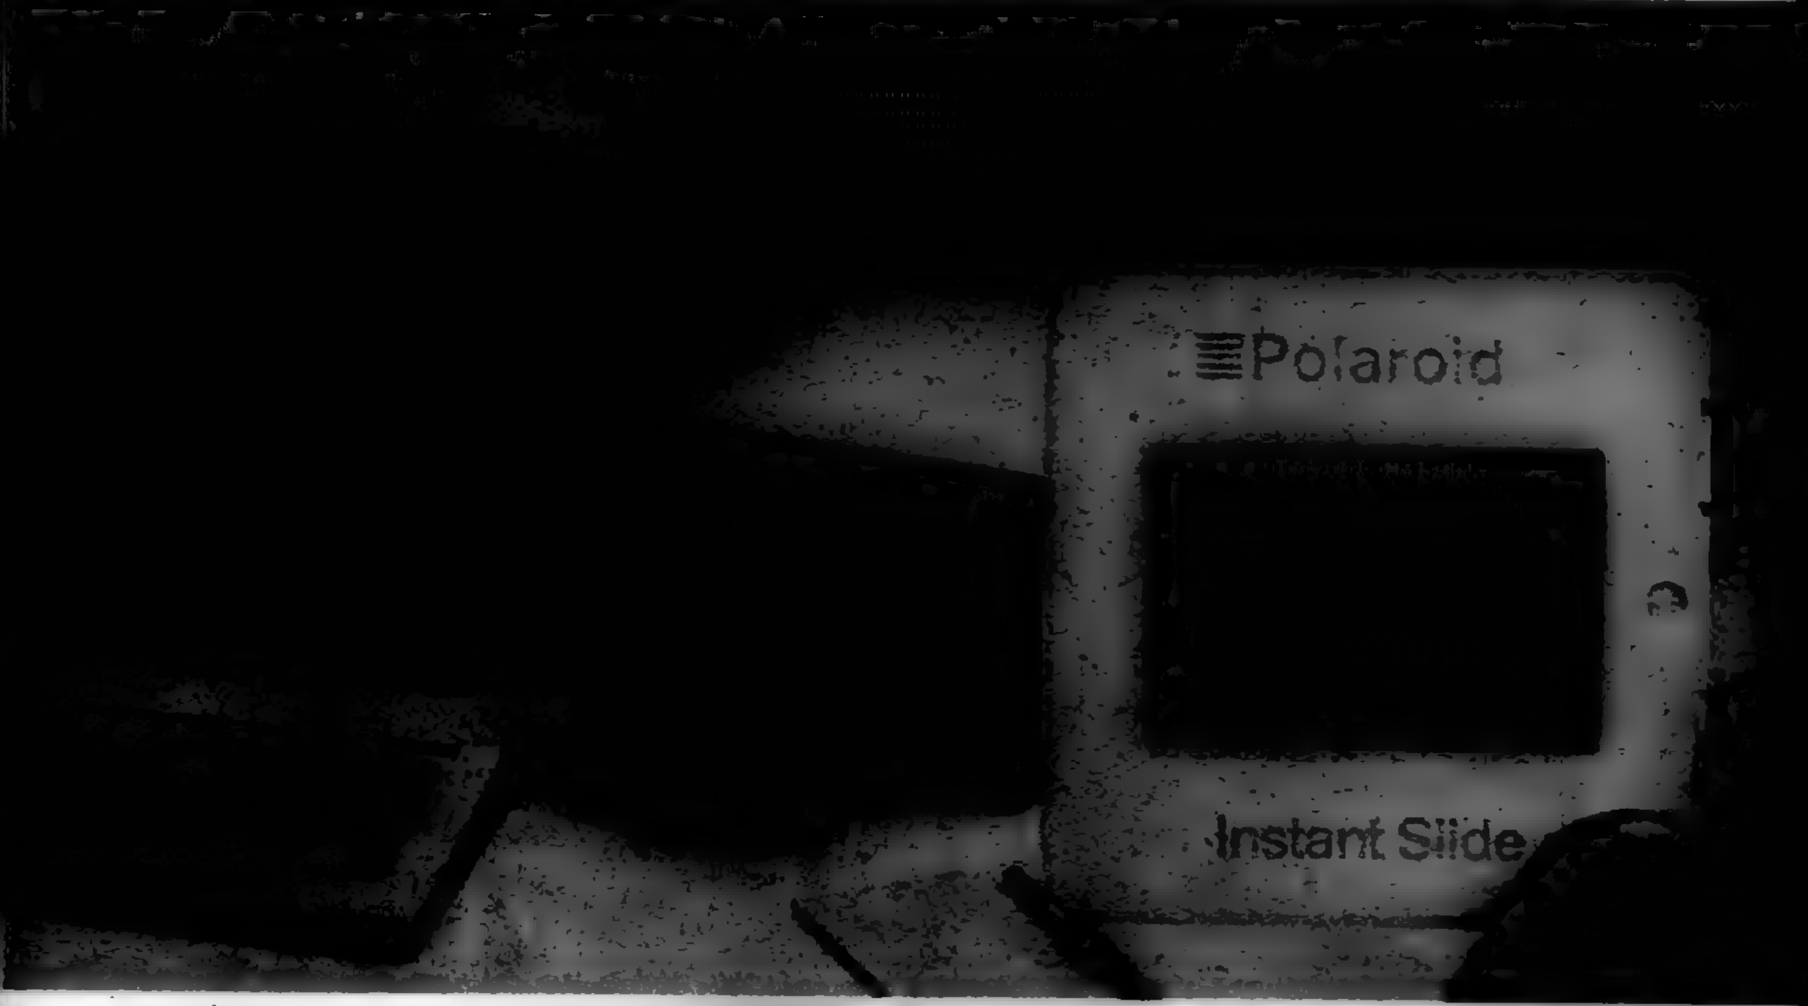
The author's research on companies has included 3M Corp., IBM, Digital Equipment Corp., Data General Corp., Hewlett-Packard Co. and Texas Instruments, Inc.

Peters first published an article in *Business Week* in July 1980 based on the findings of a survey on company excellence. The findings, published in book form by Peters and coauthor Bob Waterman in November 1982, became a best-seller.

The registration fee for the full conference is $200 by Feb. 4 and [illegible] thereafter.

Additional information on the conference and exposition is available from National Trade Productions, Suite 400, 2111 Eisenhower Ave., Alexandria, Va. 22314.

Now last minute presentations can be made from your personal computer. In color. In house. In minutes.



Introducing Polaroid Palette.

Whether your presentation is in 30 minutes or 30 days, the new Polaroid Palette Computer Image Recorder will make it easier. Priced at under $1800*, it lets you make Polaroid instant 35mm slides or prints from personal computer-generated data. Right at your desk. So now you can create a presentation in minutes. Without sending out for processing, paying premiums for rush service or risking the security of your confidential information.

Works with the graphics packages of the IBM PC or XT, DEC Rainbow, Apple IIe and II+ as well as other pcs.

The Polaroid Palette is designed to work with many graphics software packages. In fact, when using such popular programs as Graphwriter, Chart-Master, Sign-Master, DR Draw and DR Graph, Palette can virtually double both the horizontal and vertical resolution of your monitor. Plus, a "backfill" feature reduces raster lines for a smoother, more finished appearance. The result—presentation quality slides. On-the-spot.

Color 35mm slides, even from a black and white CRT.

Think of it as an artist's palette. Because Palette "paints" your graphs, charts and text. You're choosing from up to 72 colors. If you don't want red, press a few keys—it's green. And if you're not the artistic-type, Polaroid has developed a menu of color sets: combinations of colors that have been specially coordinated to complement your presentations. And all of this is yours, even if you have a black and white monitor.

Lets you make last minute changes or add up-to-the-minute information.

The Polaroid Palette is the fast, convenient, low-cost way to prepare slides for your presentation. And perhaps even more important, Palette allows you to keep confidential information confidential. You won't have to send your work out to anyone again.

So why wait until the last minute to find out about Polaroid Palette? Call this toll-free number or return this coupon. Because with Palette you'll make your deadlines, in no time.

For a demonstration, call toll-free, or mail the coupon to Polaroid Corp., E.I. Marketing, Dept. 608 575 Technology Sq., Cambridge, MA 02139.

INTERNATIONAL REPORT
CW International News Network

CHINA

BEIJING — China will adopt more flexible policies toward foreign investment, State Councillor Gu Mu said at a recent investment symposium here. The councillor said the government was currently considering cutting income taxes for all enterprises using foreign capital. Preferential treatment would be given to foreign start-ups, and the old 30-year time limit could be extended for projects with heavy investments and long gestation periods. He also said the country would allow high-tech products to be sold in its formerly closed market in exchange for the advanced technology that China needs.

ENGLAND

LONDON — British Telecom is reportedly running into trouble with its Kilostream digital network, which is intended to provide business users with inexpensive private digital circuits. After the system was installed in several major companies, it was discovered that local exchanges were found not to be equipped with the necessary multiplexers to handle Kilostream communications.

FRANCE

PARIS — Matra Informatique, the French aerospace group, has joined forces with the Norwegian minicomputer maker Norsk Data A.S. (ND), to research and develop superminicomputer technology cooperatively. The two companies will be jointly working on new products, including a Cmos large-scale integration version of the ND 500 and a 32-bit workstation based on ND technology. Matra will control a French subsidiary of ND, which will manufacture and market the ND 500 supermini family in France in 1985.

JAPAN

TOKYO — Hitachi, Ltd. has developed a man-machine interface that reportedly can handle handwritten input. According to the vendor, the user writes on the display in much the same way he writes on paper, and the system matches the characters to its character set: 2,300 Kanji, Hiragana and Katakana characters, the English alphabet and numbers. The product is expected to come to market next year.

MEXICO

MEXICO CITY — IBM reportedly intends to open a major personal computer manufacturing facility here. If approved next month by Mexico's National Commission on Foreign Investments, the plan would enable IBM to become the first foreign micro maker to establish business here without giving up a majority interest to a Mexican partner. The Mexican government recently said it would allow a foreign firm to exert majority control in a Mexican company, provided the firm created a significant number of jobs, produced an exportable product and brought new technology to the country.

THE NETHERLANDS

AMSTERDAM — Prices on some 800 IBM software products here will be raised as of Jan. 1, according to IBM Netherlands. The average price hike will be 10%, although prices on some products, including the vendor's Information MVS, the OS/VS version of ACT/Vtam and the Data Base/Data Communication Data Dictionary, will jump 20%. In addition, license fees on VM/SP, VSE/Vsam, CICS under DOS/VSE and Sequel/DS will increase by 15%, an IBM spokesman said.

USSR

MOSCOW — The USSR reportedly has agreed to sell its first-ever supercomputer for export to India, with a delivery date slated for early next year. The only information known about the machine is its $20 million price tag, which places it in the same category as the Cray 2 from Cray Research, Inc.

The machine is thought to be an advanced version of the 200-million-floating-point-operations-per-second (Mflop) parallel processor shown at the Leipzig, East Germany, fair earlier this year. The Soviet supercomputer is understood to perform between 400 and 600 Mflops, sources said.

The supercomputer is said to be part of a larger deal with India, a country with which the U.S. has refused to do high-tech business because of the U.S. belief that the computers will be used for India's nuclear defense program.

WEST GERMANY

MUNICH — At the recent Integrated Telecommunications Congress here, German Postal Telephone and Telegraph (PTT) Minister Christian Schwarz-Schilling presented the PTT's plan for an Integrated Services Digital Network (ISDN).

The scheme calls for an influx of roughly $300 million a year to digitize existing networks by 1988. The German PTT is anticipating between four million and five million participants in its ISDN by 1990.

Forte introduces

TURNAROUND TIME

Larry Long

Q During the last 25 years, I've advanced to a position of MIS responsibility with more than 100 people under me. I enjoy my job and would love to continue to advance within the company. But, there is literally no room.

Given this situation, I released my name to a search firm that got me an interview and a job offer.

Here is the problem. I could stay here and perhaps stagnate in my current position or, if I am promoted, I would most likely end up with about double the responsibility of my current job. If I took the job [offered by the search firm], I would be No. 1 in MIS in a much smaller company. If I leave the company, and if tradition prevails, I would have no opportunity to return to my present company. If I remain in my present position, I may have a one in four chance at the top slot but not in the near future. Any insight would be appreciated.

I could never recommend that someone wait for career opportunities to happen. Fast burners create their own opportunities, then take advantage of them. You could spend the remainder of your career waiting. Do you want a new challenge or do you want to wait?

Q A manager in another department purchased a couple of micros about a year ago, and he has been very successful in applying them to his department's needs. His success has gained a lot visibility for him and his department throughout the company. Their success is the impetus behind a decision to buy 40 microcomputers for distribution to other departments. My department, information systems, has been placed in charge of the evaluation, selection, acquisition and implementation process.

In a recent meeting, many of the managers expressed an interest in purchasing portable micros so they can work at home. Most of them have no experience with desktops micros. Do you think it is advisable to purchase portable rather than desktop micros?

I'm assuming that you are referring to portables, the lap variety, rather than the transportables. I define a transportable as a micro that can be packaged for movement and weighs about 30 lb. Practically speaking, these are a little heavy for frequent movement between home and office.

On the other hand, lap micros are so portable that they invite managers to include them with other briefcase items. Several available lap computers are at least as powerful as most desktop micros. The complaints that I have heard stem from the limitations of the liquid crystal flat panel display.

I would recommend that you select a compatible desktop and portable, detail the trade-offs, demonstrate the use of each and encourage the managers to spend at least an hour interacting with each system. Then, let them make the choice.

Given that your managers understand the trade-offs, I would expect that only those who truly need portability will opt for portable micros.

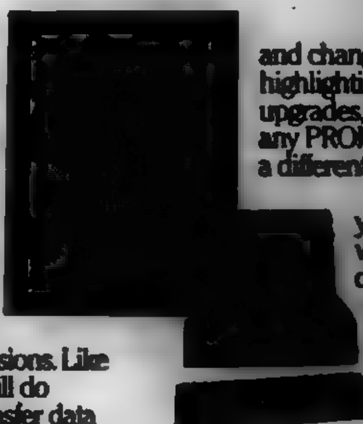
Q I manage a small customer service group whose primary functions are order entry and responding to customer inquiries. The information for most customer inquiries is not readily available, so we normally call back the next day.

I came to the conclusion that our company is technologically obsolete in DP and is going nowhere, so we decided to order a small computer with six workstations and implement our own system. The system will enable us to be more responsive to our customers. The disadvantage of the proposed system is that it will overlap with existing processing and result in some duplicate data entry, but the benefits seem greater than the costs. Our DP manager thinks we are wasting time and money, yet he [illegible] solution to our problems. Do you [illegible] should wait on DP or proceed with our plans?

Information systems progress is [illegible] necessarily a function of state-of-the-art knowledge. As I talk with successful MIS and user managers, I am becoming more convinced that cooperation and willingness to learn are more important than keeping pace with the technology. Having your own system may be the answer, but before you create an essentially autonomous system, I would reestablish a dialog and an attitude of cooperation with the DP manager. Hopefully, your manager will reciprocate.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, *P.O. Box 880, Framingham, Mass. 01701.*

the smarter ~~desk~~ disk



You've read about the IBM® 3270 PC. Now there's a technology that gives your existing PCs and compatibles IBM 3270 PC emulation. And more.

You can run all this concurrently: an IBM DOS session, mainframe sessions with four different hosts, and two note-pad sessions. Like IBM's machine, your PCs will do windows. You can even transfer data between windows. Save your work on diskettes. Then upload to the mainframe.

Unlike IBM's system, the Forte 3270PC™ emulator is entirely soft-loaded from diskette. With high-powered, menu-driven software. You can reconfigure the keyboard and change screen colors or highlighting at will. For upgrades, you don't replace any PROMs. Just plunk in a different diskette.

With Forte, you won't get stuck with an obsolete or impossible-to-upgrade product. In fact, if you already own Forte PJ,™ just call your local distributor for a fast upgrade to the Forte 3270PC on disk.

We're faster than IBM, too. With local screen capture. Transfer of whole files instead of single screens.

So before investing in a "smart desk," see how Forte can transform the PCs you already have into something even smarter.

Micros topic of conference

SAN FRANCISCO — The National Institute for Management Research is sponsoring a three-day conference entitled "Financial Information Systems — Integrating Personal Computers," Jan. 30 to Feb. 1 here. The conference will be held at the Sheraton Palace Hotel.

Registration is $595. For three or more attendees, the fee is $295 for the third and subsequent registrants.

More information is available from the National Institute for Management Research, which is located at P.O. Box 3727, Santa Monica, Calif. 90403.

Knight-Ridder tailors software to its needs

CHARLOTTE, N.C. — The data center staff of a newspaper publishing company here needed no help from reporters to dig up the hard-nosed facts about user access.

When users get on-line access to data through micros, workstations and distributed processing, data processing gets headaches trying to maintain security, according to Mike Presley, software support analyst for Knight Publishing Co.

"When you start supporting all of these tasks," Presley said, "you start exposing your system and data to all sorts of outside influences. This can be a little unnerving to a long-time DP manager. If you have a path to the outside world, you have a security risk. There is no way you can get around that simple fact."

Besides acknowledging this threat from outside on-line access, Knight recognized the possibility of unauthorized inside use. "A programmer can easily access sensitive files, like personnel or payroll, by simply submitting a batch job," according to David Orbaugh, director of Knight's advanced systems division.

When the firm decided to purchase a security system, it chose to pursue security through software rather than hardware, Presley said. The firm found hardware components such as performance monitors and automatic dial-back systems — with their related connect charges — too expensive to buy and maintain. "To obtain the security we needed by going the hardware route would have been prohibitively expensive," he said.

Knight looked for a software package that could protect data from breaches through either its on-line CICS facility or its batch system. "We look upon our data as an important company asset," Orbaugh said. "Any threat to its integrity is a major concern, so it seemed to be inappropriate to invest time and money in a security system that didn't protect both batch and CICS jobs."

Guidelines from a corporate auditor on the protection of resources, data files, batch partitions, programs and other data assets led Orbaugh toward a software security package, CA-Sentinel from Computer Associates International, Inc. "Everything that our corporate auditor had expressed concern about was included in the facilities of CA-Sentinel," Orbaugh said.

He brought the package to the attention of his division, and the division convinced the company's management to purchase the package. "We strongly recommended the system," he said, "because what we had seen up to then only included on-line protection. CA-Sentinel protects the entire system."

The data center at Knight, one of the South's largest publishing companies, is responsible for maintaining all of the company's business information. Knight, which is a subsidiary of Knight-Ridder Newspapers, Inc., publishes two papers, the *Charlotte Observer* and the *Charlotte News*, with a combined weekly circulation of 500,000.

Data center services

Services the data center performs include general accounting jobs along with advertising, marketing, customer service and distribution applications. The center operates two 4M-byte IBM 4341 Model 1 CPUs under DOS/VSE, with CICS/VS as its primary on-line facility. One remote terminal, used by Knight's circulation department, accesses the system.

Presley said CA-Sentinel secures information in one of two ways.

- Through data restraints. When a person attempts to access data, the software looks for identifiers on the recording media that tell the system whether the user is authorized to use the data.
- Through resource restraints. Physical resources such as terminal names and specific batch partitions can be taken off limits during any period of time.

Within these methods, the system administrator can selectively manipulate 18 security mechanisms. The package can restrict access to CICS files, programs, tasks, storage and transient data; can limit DL/1 I/O calls; and can control pseudo batch partitions within an interactive computing and control facility.

Choosing constraints

Using on-line menus that he can call up on a terminal, the system administrator chooses the constraints he wants to implement at any given time, Presley said. "The real beauty of CA-Sentinel is that we can tailor our security measures any way we want. We don't have to secure any more than we want to."

He said a DP shop must consider budgeting its security measures — protecting critical information more than less crucial data — so as to conserve valuable system resources. With the security software package, he said, "We have a nice balance between efficient data throughput and adequate data integrity."

Knight is looking into the possibility of interfacing micros to its system sometime in the future but has no firm plans right now, Orbaugh said.

Only Texas Instruments packs more portable terminal into less space.

Here's a brief case for the Texas Instruments Silent 700™ Model 707 Portable Data Terminal.
It's the latest and lightest in a long line of standard-setting Silent 700™ terminals. And it's the most versatile full-function portable anyone can pack into a briefcase.

By carrying TI's Model 745 one step farther, we made the best even better. The 707's standard internal modem connects to any telephone network while the optional acoustic coupler and battery pack make it fully portable. The spreadsheet size 132-column printer is now standard. And TI's solid state plug-in cartridges can add functions for your current use and later expansion.

For the standard-setting terminal that packs more product into less space, get the TI Model 707. At only six pounds, it packs more full-size functions than any other portable ...all at a surprisingly low price. For more information contact: Texas Instruments Incorporated, P.O. Box 402430, Dept. DTB-163OW Dallas, Texas 75240.
Telephone 1-800-527-3500.

Standardization, training unite bank affiliates

TORRANCE, Calif. — When the nation's largest multistate bank holding company, First Interstate Bancorp, formed its data processing subsidiary in 1976, the company had DP facilities in each of its 21 affiliate banks.

"We inherited just about every brand of hardware known to man," said John Riggs, vice-president and corporate training manager of First Interstate Services, the DP affiliate that provided information processing services to the banking offices.

The challenge for First Interstate Services was first to standardize its hardware and software, then to train its users on the equipment. The equipment has since been standardized to IBM, and the DP affiliate has been organized into eight data centers nationwide staffed by 2,000 employees.

"By joining forces, DP services have improved. DP has a lot more leverage with vendors, and we've saved money by pooling resources," Riggs said.

But as DP technology spread through the banking network, DP training needs became more complex. Employees had a range of computer experience, and DP professionals needed to learn business skills. End users needed to learn how to use popular software packages and to access the bank's mainframes from more than 500 IBM Personal Computers.

In January 1983, a training department was formed within the service company's corporate structure, and Riggs went through a career change, crossing from DP to training management. He was charged with developing a companywide technical and nontechnical training program.

Program objectives

Working with senior management, Riggs outlined the following objectives for the training program:

- Offer skills training aimed at the appropriate personnel at the specific time required.
- Establish a comprehensive training resource.
- Provide uniform training to the distributed centers.
- Develop a coordinated approach to computer-based training (CBT).
- Set up a system for analyzing, monitoring and evaluating training.

The resources committed to achieving these objectives included a professional trainer, seven regional training managers, top-notch seminar presenters, skills training and management information courses from Deltak, Inc. of Naperville, Ill., and a $2 million DP training budget.

"Our biggest problem was that we often found ourselves reinventing the wheel in each regional center," Riggs said. "The quantity and quality of training varied. We needed a companywide training plan, a basic framework within which each center could work, with allowances for individual center needs and priorities."

Training needs are now identified at each regional data center. The program consists of in-house training for first-line supervisors, middle management, project management and end users; Deltak's video-based, self-paced technical and nontechnical training and its CBT for micros and mainframes; vendor-conducted hardware and software training; company-sponsored training; and outside seminars.

Technical skills training

Because the data centers are geographically dispersed and employees' needs so diverse, the technical skills training program was built around video- and computer-based training courses from Deltak. Deltak courses address a broad range of DP subjects such as MVS/SP JCL; command-level language for IBM's CICS; and Information Builders, Inc.'s Focus, a fourth-generation applications programming language.

"The main strength of Deltak's courses is that they can be delivered on-site; you don't have to take people away from their jobs," Riggs said. "As a result, we can offer ongoing technical training to our staff whenever it needs it."

As microcomputer use spread throughout the banks, end-user training became a high priority. End-user computing services and training are provided through information centers associated with four of the regional DP offices.

Infofast, the first and largest First Interstate Services information center, is located in Los Angeles. It serves more than 700 users, primarily from the First Interstate Bank of California and the corporate holding company.

For the future, more emphasis is being placed on CBT. "We track the expense of training, but we don't track the cost of time away from the job required to complete training programs. As we become more sensitive to this, we'll use more CBT," Riggs said.

The bank is also considering a technology training program for senior management. This program would focus on DP management, strategy and technology. It would also address potential upper-level-manager-reluctance to becoming part-time DP students.

BEFORE RAMIS II,
THE APPLICATION PUZZLE NEVER
QUITE CAME TOGETHER.

HOW ALL THE PIECES FIT—
AND THE RESULT IS
INCREASED PRODUCTIVITY

RAMIS II is a powerful software system that delivers greater productivity through all three stages of the application lifecycle. RAMIS II's ease of use allows you to develop *prototypes* quickly and efficiently.

RAMIS II

To *implement* these prototypes and produce comprehensive and reliable applications, RAMIS II offers a full range of integrated tools. And it has the flexibility to *enhance* systems so they remain current with user needs.

For the computer specialists trying to make headway against an applications logjam, RAMIS II slashes the time between initial request and finished product, letting them implement more projects and receive the benefits of each one sooner.

SEE THE NEWEST TOOLS FOR
APPLICATION DEVELOPMENT
AT A RAMIS II SEMINAR

With RAMIS II, you get applications development capabilities on the leading edge of technology. Like a powerful *new* transaction processing language. And a *new* high-performance compiled applications development language. Plus an elegant screen-painting feature for data management and creation of menus.

Whether you choose to develop complete 4th-generation applications, or use RAMIS II's flexible reporting and analysis functions to add new life to your existing ones, you'll want to attend a free Production Applications Seminar.

Register today for a seminar in your area. Call 1-800-257-5175 or return the coupon below. That's the first step in solving the application puzzle. The next, of course, is RAMIS II.

MATHEMATICA
P.O. Box 2392, Princeton, NJ 08540

RAMIS II... THE LEADER BY DESIGN

You need hardworking, multi-functional terminals dedicated to improving productivity.

AT&T Information Systems can help. We have a full line of asynchronous and synchronous data terminal products that enable you to move and manage information quickly. Products designed to get the word around.

Our DATASPEED* 4000 Terminals are engineered to get along well with people, too.

Non-glare, high-resolution, black background tilt screens, English language options, and lightweight detachable keyboards in typewriter format keep users comfortable and productive.

Features like windowing, split-screen mode, 80- or 132-column wide-screen format, and nonvolatile PF keys help reduce user errors.

Conversational and editing terminals that speak for themselves.

The DATASPEED 4410, 4415, 4420 and 4430 Terminals are asynchronous desk-top workstations with superior features and functionality.

The 4410 is conversational, with graphics and sophisticated display capabilities.

If you need an editing display terminal, the 4415 is one of the most functional in its class. The 4420 is a feature-rich editing display terminal. It's especially engineered to help the nontechnical user become proficient quickly.

The 4430 is a conversational terminal for the multi-point, private line environment. There's no need for the computer to poll and address these multi-point terminals. This saves you valuable processing time.

Synchronous terminals on speaking terms with IBM.

AT&T Information Systems' DATASPEED 4540, Enhanced 4540 and 4540 Touch Screen Terminals are designed for a clustered, polled environment. All of these synchronous terminals are compact, modular and 3270 compatible.

TERMINALS. WE SPREAD THE WORD.

The 4540 and Touch Screen 4540 support SDLC/BSC line protocols. With one of our new controllers, you can upgrade to SNA by simply changing a diskette.

For SNA/SDLC compatability, there's the Enhanced 4540. It offers flexibility, introducing a choice of two controllers, standard- or reduced-sized displays and high- or low-profile keyboards.

The Touch Screen 4540 has 30 touch-sensitive areas on the screen which give you fast, easy access to information.

A history of communicating better.

AT&T led the communications revolution over 100 years ago. Our products and service set the standards for performance and reliability.

Today, 4,000 scientists from Bell Laboratories are working full time to develop and design new business products at AT&T Information Systems Laboratories. Products we continue to support by the largest, most experienced sales and service force in the industry.

Our family of DATASPEED Terminals incorporate Information Systems Architecture, the design principle that integrates our products so they perform as one system. As you grow, the flexibility of Information Systems Architecture allows for easy system expansion.

To learn how our family of DATASPEED Terminals can increase your profits and productivity, call 1-800-247-1212, Ext. 329.

WHEN YOU'VE GOT TO BE RIGHT.

Information Systems

Restaurants eliminate paperwork, lessen errors

ATLANTA, Ga. — When Arby's Inc. wanted to put the bite on errors and improve efficiency in its system of collecting payroll data, it turned to the use of small terminals with attached acoustic couplers.

The terminals, each measuring five by three inches and weighing about half a pound, allow the managers of each Arby's restaurant to send what would otherwise be a mouthful of data — their weekly payroll information — to the corporation's IBM System 38 mainframe here at the firm's headquarters.

The system, in use since January 1983, has replaced verbal reports, which had once occupied 20 operators at a service bureau, the corporation's former payroll processing site. "We ended up with a 25% error rate with people transposing figures" under the previous system, recalled Bill Needham, manager of Arby's point-of-sale system.

The terminals are part of a data collection system called Toes, from Interface Technology, Inc. Each week, they are used to upload payroll information to an IBM Series/1 minicomputer, which creates data files and passes them on to the mainframe for later processing. Needham said Arby's was largely pleased with the terminals, called Port-a-Store units, though he found them "very sensitive to telephone line problems" and would like them to come equipped with automatic shut-off switches.

Without the auto-off switch, Needham said, managers are likely to leave the unit on accidentally. "We get eight to ten calls a week saying 'what's wrong with it,' and the battery is usually dead," he said.

The terminals allow restaurant managers to enter payroll data (employee number, rate code, hours worked) into the Port-A-Store at their convenience, check it for accuracy, correct mistakes and add or delete lines. When the manager is sure the data is accurate, he calls the Toes computer at Arby's headquarters. An electronic voice answers with, "Hello, this is Arby-Net, please enter unit number and security code."

The manager positions the terminal to the first line, attaches it to the telephone mouthpiece and presses the transmit button. The terminal transmits the unit number and security code using Touch-Tone signals and the computer checks the code and prompts the manager for the next information.

The Toes voice repeats each entry before it prompts for the next line so the manager can check for accuracy. It also reportedly informs the manager of any errors and allows him to cancel lines and make any changes before they sign off.

The benefits of the Toes system have included a reduction of three or four minutes in the amount of time managers spend transmitting the payroll data — it had taken them as much as a half hour previously — and a reduction in errors, Needham said. In addition, the Arby's MIS department reportedly can generate a report showing which restaurants have not yet entered payroll data for the current period. This is said to expedite the collection of late reports and promote efficient closing of the pay period. The number of calls made by each restaurant and the time spent on each call can also be monitored, enabling problems to be isolated quickly.

In December 1983, Arby's added coupon sales and product sales reports to the Toes system. These reporting applications give Arby's the latest sales information. Each coupon promotion can be evaluated almost immediately from coupon sales reports, whereas before it took several weeks to gather information, compile it and then analyze the effectiveness of each promotion.

General DataComm
beats Hayes
for accuracy.

Supplier boosts output with electronic printer

WICKLIFFE, Ohio — Two years after it switched to an electronic printing system, Bailey Controls Co., a process industry supplier based here, found it was saving $64,000 in paper and printing costs annually. It is also getting more printing done and getting it done faster, according to DP operations manager Leonard Bruno.

One of the biggest cost savings for Bailey, Bruno said, was derived from the 9700 printer's ability to print in duplex, using both sides of a sheet of paper. "We figure we save between $2,500 and $3,000 each month in paper costs alone, simply by printing in duplex," explains Bruno. "Our original goal was to print 75% of our output in duplex. Now, it's been so successful that we're at about 90% duplex printing."

Bailey's savings in paper costs, however, were not due entirely to the acquisition of the new printer, Bruno noted, but also occurred because of the firm's war on paper waste — which saved it $42,000 and cut paper use by 20%. The firm designs, manufactures and markets high-technology instrumentation and control systems.

Prior to leasing the Xerox Corp. 9700 electronic printer, Bailey's NAS 6650 computer, running under an MVS 3.8 operating system, was generating some 1.5 million pages of output every month, supplying the company with documents ranging from proposals for customers to time-critical daily inventory and order processing reports for manufacturing, according to Bruno.

To keep up with the heavy demand, Bruno said, two Xerox 1200 series nonimpact printers ran almost around the clock, and overtime costs averaged $500 per month.

The 9700 printer handles between 500 and 600 jobs daily, Bruno said, and has allowed the firm to increase its accuracy in meeting printing schedules from a little over 99% to 99.8% — with less than 2% downtime. "It used to take us two whole shifts to print all our reports," Bruno noted. "With the 9700 printer, we finish in plenty of time, and we can get more out if necessary. If we run into a problem, the speed of the 9700 allows us to recover and still meet our deadline."

The company runs the 9700 printer on-line, printing on plain 8½- by 11-in. paper at up to 120 pages per minute.

The computer-controlled printer uses xerographic printing, under which a laser beam creates images on a photoreceptor belt and the images are transferred to paper. The 9700 prints numbers, text, logos and forms.

Bailey's printing manpower requirements have also been reduced, saving $23,000 yearly, Bruno said.

Now, he said, only one operator is needed to monitor the laser printer during its heaviest use, and less operator handling is required because reloading toner and developer is easier, and "fixing the jam . . . is twice as fast because the machine tells you exactly where to look."

And we can prove it.

We put our 212 modem to the critical test. We stacked it up against Hayes, one of the "smart" modems.

The Performance

Hundreds of phone calls were carefully monitored, analyzed, and verified by telecommunications engineers. After exhaustive testing, the results were conclusive: when line quality was average, our modem was one and a half times more accurate than Hayes. When line quality was bad, however, our modem was up to ten times more accurate. And when line quality was really bad, their error rate shot up to as much as 100 times ours! The errors ranged from misspelled words to incorrect numbers. The implications for modern business are understandably serious.

The Reliability

Then we went inside and did a component count. The final score: Hayes 252, us 155. This can be viewed two ways: Either Hayes has a 60% better chance of developing part failure, or our modem has a 60% better chance of delivering higher reliability.

Eliminating operator risk is as important to us as eliminating errors. With our modem there's virtually no risk of electrical damage because there are no internal switches to deal with. General DataComm modems automatically select all call parameters.

The Company

The General DataComm intelligent modem is the newest product of a company that has been designing data communication systems for 15 years. A company whose customer list is a "Who's Who" of international business. Most of the Bell operating companies, and other telephone companies in the U.S. and Canada. Major banks. Brokerage firms. And many of the Fortune "500."

We build multiplexers, modems, local area and digital network products, and the most complete networking systems on the market. Now we're applying the technology that won the respect of big business and Bell to the personal computer market. With a line of 300 and 1200 bps modems and our own communications software.

The General DataComm modem. We put it to the critical test. Now it's ready for the ultimate test. Yours. To find the dealer nearest you, contact the Personal Computer Products Dept., (203) 574-1118. General DataComm Industries, Inc., Middlebury, CT 06762-1299.

Tool aids firm's DOS-to-MVS conversion

SOUTH BRUNSWICK, N.J. — When business operations at Dow Jones & Co.'s Computer Service Facility were reaching peak load last year, the company decided to change operating systems, hoping to streamline maintenence. But managing the conversion was not an easy task.

In 20 years, Dow Jones has gone from using batch systems running on the backup computer for a typesetting/message-switching system to an on-line system using approximately 300 terminals in 23 locations operating on three IBM 4331 Model Group 2 machines under DOS/VSE.

Handling a data storage increase of approximately 25% a year, in January 1983, the Computer Service Facility business staff consisted of 30 programmers, 22 operations people running three shifts 24 hours a day and 12 technical services people. With more than 25 systems and approximately 2,000 programs, the group was using 84 volumes of data, each with a capacity for storing 317 million characters. The site was rapidly becoming a large and complex environment requiring many DOS/VSE systems.

"It was time to stop and reevaluate our environment," said Jim Golis, systems project leader. "We were on the verge of becoming bogged down in sheer complexity. A conversion to MVS was a sensible alternative."

With that in mind, in January 1983, a project team representing the business areas of the Computer Service Facility was formed to research the possibility of converting from DOS to MVS. By spring, the group presented a conversion proposal to management.

The proposal included an inventory and evaluation of the current system environment, company growth projections, a detailed report on the business system, an implementation plan and breakdown of responsibilities throughout the conversion, estimated costs and cost justification. In June, the project team got the go-ahead.

An effective conversion tool

"One of the first things we knew we needed was an effective conversion tool for both JCL and Cobol source code," Golis stated. After examining the marketplace, Golis chose three systems to evaluate — IBM's conversion aids, Uccel Corp.'s Duo and Focus and a product developed by Arkay Computer, Inc. of Newton Centre, Mass. Arkay Computer was recently acquired by Computer Associates International, Inc., and Focus is now marketed under the name CA-Convertor.

Golis established a list of the requirements he expected to be filled by a conversion tool. "First of all, you want the conversion tool to do as much of the work as possible," Golis explained. "Conversions require minute attention to detail. . . . To experience hands-on training, you want your programmers to be involved in the process, but you have to reduce the amount of repetitious work and keep them challenged and motivated.

"Next," he added, "the conversion tool has to reflect and interface with your software and methodologies. Dow Jones has a mix of software products from a variety of vendors. You need a tool that will be compatible and function with the code of all those vendors. In addition, the package must be compatible with the standards and naming conventions at your site.

"The conversion package should also be able to monitor the conversion process," Golis continued. "It should report on progress — what has been converted and what has not. It should provide an inventory and cross-reference information on files, programs and jobs."

Maintenence, ease of installation and documentation as well as cost were also considered. Golis then set up a table and evaluated each of the three products on a scale of one to 10.

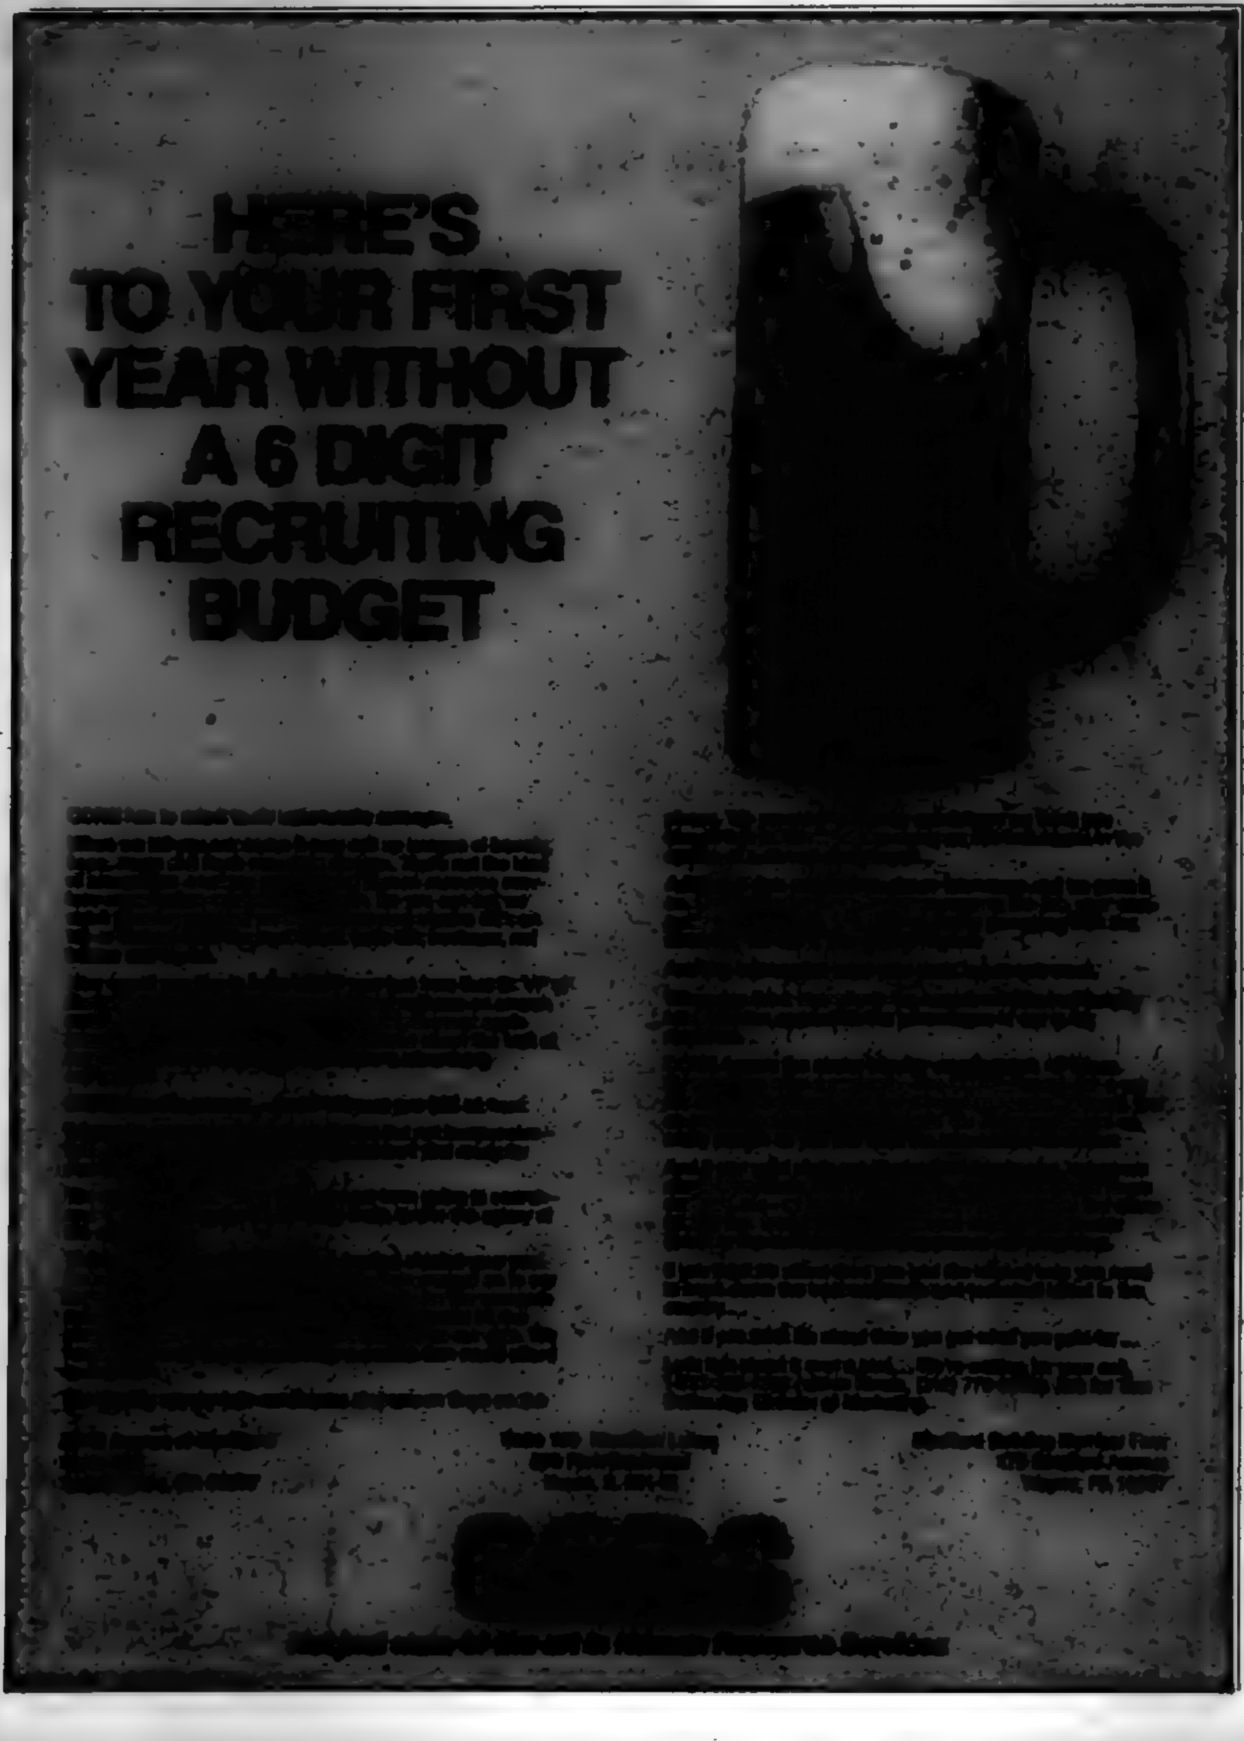
"CA-Convertor was the clear leader," Golis said. "It does the majority of work for us, and only exceptions are handled on a manual basis. This helps in the training process, for example, and also allows our staff to become actively involved at a non-tedious level. CA-Convertor reads the DOS source code, gives us a list of the OS code and creates an OS member directly in our source statement library.

"If there are exceptions, CA-Convertor shows us the lines of code [and] indicates what it did to correct them. We review the correction, and 95% of the time, it will compile."

Dow Jones' Computer Service Facility runs the conversion software during the day "just like another job," Golis said. "I would say it's the equivalent of about a quarter of a compile in runtime," he added.

CA-Convertor has interfaced with the vendor-supplied software at Dow Jones, according to Golis. "It has also helped us maintain our standards. With CA-Convertor, we provide the unit names we're using and the [direct-access storage device] information, and it sets up the space characteristics we want. It also sets up the OS data set names according to standards. If we were doing the

See CONVERT page 55



HERE'S TO YOUR FIRST YEAR WITHOUT A 6 DIGIT RECRUITING BUDGET

Accounting system aids firm's vendor payments

TORONTO — A corporation with 20 operating companies and a booming business cannot afford to stick to outdated methods of paying vendors.

Rogers Cablesystems, Inc., headquartered in Toronto, is a multiple cable system operator that serves nearly two million subscribers in Canada and the U.S. Until 1982, Rogers processed 2,500 invoices a month — payments from its 20 operating companies to more than 63,000 vendors — on an internally developed batch system, said Bruce McBurnie, manager of applications support.

In 1980, corporate executives decided to shop for an accounts payable software package that would allow all of its divisions to enter their data on-line, McBurnie said. The executives also wanted better control of charges to account numbers, he said. Major enhancements to the existing batch system were ruled out, since they would cost more than buying a new accounts payable package, he added.

Rogers selected the MSA Accounts Payable System from Management Science America, Inc. of Atlanta and had the system up and running by January 1983, according to McBurnie. Similar packages that the company looked at were not offered on-line at the time or were not on the market long enough to have been proven effective, he said.

The company now has one central processing location in Toronto for the Accounts Payable System that runs on two IBM 4381 computers under IBM's DOS/VSE operating system. The operating companies in Canada and the U.S. communicate via dedicated lines using IBM's 3278 remote terminals, McBurnie said.

Easier to spot problems

The new system has made the accounts payable process much more efficient, according to McBurnie. It is easier to spot problems and fix them immediately, he said. Vendors who call for information can get it quickly, instead of being put on hold while people search through file cabinets, he added.

All divisional reports go back through remote spooling and print at the remote location, McBurnie said. Many of the system's criteria have been standardized for all Rogers divisions by the corporate managers, he said. Options, however, are at the discretion of each division's management.

Many divisions use the system's recurring invoice feature for standard payments, McBurnie said. Once a contractual payment has been entered into the system, the computer takes over, eliminating the need for manual entry every month, he said.

Rogers' Toronto division sets up automatic payment dates and discount dates with terms of 2%, 10 days; net 30, McBurnie said. If the invoice clears the internal approval process on time, the system takes the discount automatically, he added.

Pauline Vancott, supervisor of accounts payable for Rogers' largest cable division, said, "If an error occurs, it flashes on the screen as we're working, and we can balance it immediately on-line." Some of the operating companies were using manual procedures before, and the new system saves hours of work at month-end, according to Vancott.

CONVERT

from page 54

conversion manually, we would be faced with a collage of different styles of coding from the various members of the conversion team. Now we're getting good, consistent code that reflects our standards."

A conversion manager, the monitoring component of CA-Converter, has helped Golis stay apprised of the progress of the project. Instead of talking individually to each member of the team, he can go to the conversion manager for a report of what has been converted and what still has to be done.

According to Golis, keeping management and the end users informed is one of the keys to a successful conversion. He holds weekly meetings with the conversion team and publishes the minutes of those meetings. He documents the results of the conversion for his end users.

For instance, Golis explained, "We ran a billing run for one of our systems which used to take 17 hours in DOS. It now takes less than eight hours. Visible results like this and the faster CICS response time have helped us get the maximum amount of cooperation from our users when we've had to freeze a system."

After management had approved the project and at the same time evaluated the conversion tools, Dow Jones installed a complete MVS system on an IBM 4341 to get the project under way. A conversion plan was also established by application and schedule dates.

"A DOS-to-MVS conversion has to be delicately orchestrated," Golis explained. "Here at Dow Jones, we were faced with 2,000 programs and 2 million lines of code to convert. One year into the project with the help of CA-Convertor, we are still on schedule in both time and cost areas."

Managing productivity

Imagine, if you can, working days and evenings, with a few weekends thrown in for good measure, on a project that demands the utmost of your creativity and ingenuity.

The project becomes all consuming, as original deadlines, set months before, loom increasingly unrealistically. Unforeseen glitches render portions of your work unusable, while other portions need wholesale redoing. Meanwhile, your family begins to feel the strain of your chronic absence from home. Suddenly, nothing in your life is going right.

Then, as the project finally nears completion, your boss informs you that your labors will never bear fruit — the project is to be scrapped. What's more, you and the other members of the project development team must set to work immediately on a new design plan, whose future is no more guaranteed than that of the one just thrown out the window.

Sound familiar? It is, hauntingly so, to scores of programmers. And to add insult to injury, the programmers are often the objects of blame for wasteful development projects, when the real culprit, as often as not, is poor planning at a higher level.

That a certain number of software development projects will encounter cost overruns, massive delays and millions of dollars in misspent corporate resources is to be expected, given the nature of the work.

But what is disturbing is the apparent frequency of such wasteful endeavors — and their attendant costs. According to a recent survey of 300 Fortune 1,000 corporations (see page 14), one in four large system (64,000-plus lines of code) development projects now underway will be canceled. Three quarters of them will experience serious operational difficulties. The survey found further that a typical large system project today runs more than a year behind schedule and, if completed, will cost twice the original estimate.

These survey findings mirrored another recent study of programming in the corporate environment [CW, Nov. 12], a study that described programming as "labor intensive, difficult to manage, expensive and often leading to a product that is functionally deficient, unreliable and difficult to maintain." This study also labeled programmers as "not highly professional," and programming "more like a craft than a profession."

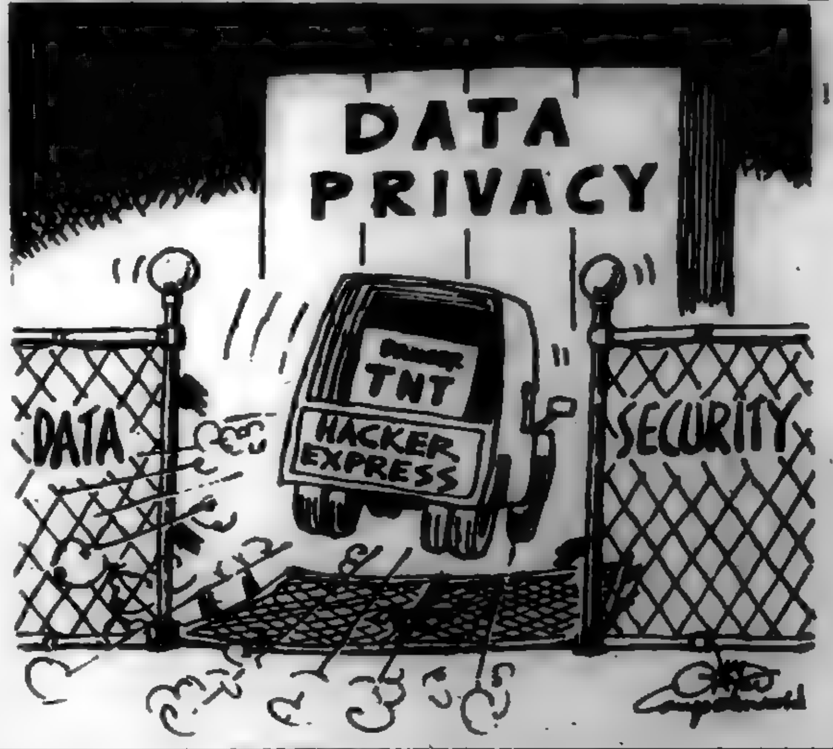
Alas, the poor programmers.They do what they are told with the tools given to them by management which hands them the project blueprint and says, "Now go and do it."

While the good news is that certain forces are at work mitigating the programmer productivity problem, DP management must heighten its awareness of what it can do to hasten the process.

■ *Hire the best.* The days of rampant programmer turnover have ended, for now anyway, so there's no good reason to hire relatively inexperienced programmers for complicated tasks. Let the newcomers cut their teeth on simpler tasks, or where they can be highly supervised.

■ *Take the lead in fostering software development methodologies designed to control costs and anticipate problems as early as possible in the development cycle.* This effort should be supported by serious testing of portions of the project early on.

■ *Wherever possible, develop libraries of reusable code.* While some argue that too much standardization in software development can stifle innovation, it appears most shops have a way to go before reaching this stage.



LETTER

A clear case for documentation

The article "Documentation: The Time-Saver" [CW, Nov. 5] is interesting, and it makes some important points. However, it should have mentioned something about the need to have documentation organized in a contemporary style.

This is the age of high tech, where information is transmitted quickly. But documentation writers are dishing out instructions as if their audiences were pounding on a Royal Underwood.

Procedures tend to be written without regard to format or readability. Often, instructional documentation contains related information that is not pertinent. To end users, it all comes across like alphabet soup. Then [the users] must waste time [sifting] through it, trying to find what appropriate action to take. Bits and pieces of related information are excessive noise and can be cross-referenced to another section — perhaps overview — or background. Presenting the important information first, in a quick, easy to read, logical order will [promote] fast, efficient performance.

Documentation has to be presented clearly and precisely. Instructions that are easy to read and follow will save time. If documentation layout is properly presented, it will lead to quicker comprehension and faster action. This may seem like an incidental matter; but it's this and the other incidentals that put food on the table.

VIEWPOINT

Managing the data center crisis

THE DATA CENTER
John P. Murray

An unfortunate situation that arises in data centers is associated with the introduction of new application systems or substantial changes to existing systems that degenerate into chaos.

The scenario is often the same. The new system is intended to provide substantial benefits to the organization, improve customer service and reduce costs.

For awhile, until the stress testing — if stress testing is used — or worse yet, the production stage is reached, all will appear to be going well.

But suddenly, the new system turns into a monster that threatens to destroy the data center operation and, in some cases, the entire organization.

Out of control

What now appears is a system that has consumed all available hardware resources. The system is out of control, has disrupted the entire work flow of the data center, destroyed the data center's client service levels and is creating an increasingly difficult situation.

Such situations do arise. They bring with them turmoil, finger pointing, unrest, anger and, eventually, senior management involvement on a rather intense level. Such situations can and should be avoided. Avoidance requires strong data center management, sound control and discipline.

Once into such a situation, it is common to attempt to fix, or avoid, blame for the current state of affairs. Often an attempt will be made to analyze the causes of the difficulty, to philosophize about "how we came to this."

These are exactly the wrong approaches at that time. Consideration of these aspects is appropriate, even necessary, but at some later date, not at the crisis time.

The key issue, once into a crisis, is to gain control, to stop the bleeding. Time and effort expended on anything other than containing and correcting the immediate crisis is simply wasted.

The key issue, once into a crisis, is to gain control, to stop the bleeding. Time and effort expended on anything other than containing and correcting the immediate crisis is simply wasted.

The tendency to panic, to resort quickly to whatever appears to offer some assistance, must also be avoided. The first step must be to make a calm, factual appraisal of the situation.

Ask yourself the following

Ask yourself the following questions. What specific programs are causing the problem? Are poor programs the only problem? Is the client and operations documentation also at fault? Are the system controls that are in place correct and adequate?

A common cause of difficulty in such a circumstance are untested or inadequately tested programs. These should be identified and an immediate effort mounted to correct those programs that are causing the difficulty.

The data center management must take a strong position in this effort. Changes to these programs must be carefully tested. They must work correctly and more effectively than those they are to replace, or they should be rejected.

It is often the case that the "nice person" syndrome is in effect in the data center. This often compounds the problem. Adopting a pattern of accepting untested, or not carefully tested, programs in an attempt to avoid hurting someone's feelings or creating conflict is not going to help anyone.

The goal of data center management in the case of an application system crisis must be, number one, to keep things from becoming worse, and number two, to build appropriate controls to move steadily toward making things better.

Swift and decisive action

Someone, obviously not the original project leader, should be selected to manage the way out of the crisis. That person should have absolute authority and control in order to be able to act swiftly and decisively. Clearly, this must be someone who is strong and not afraid to take the required action. Such action will likely bruise some egos.

This is particularly true if consultants have played a role in bringing the organization to such a state. Be that as it may, there is no time, given the circumstances, to consider anything other than the achievement of the required results.

These situations often have an insidious aspect. They seem to arise almost from nowhere, and in a very short time they reach disaster status. Data center management must work to develop appropriate controls that will effectively sound early warnings, which can be used to alert everyone to the potential for disaster. When those controls are in place, they must be relied upon and used by data center management.

Sound the alarm

Sounding the alarm does place the person raising the issue in an uncomfortable position, particularly in a situation where a great deal is riding on the new project and where considerable time and expense have been devoted to the project.

If outside assistance, such as consultants, is involved, the situation becomes more difficult, because these people will have a need to protect their positions.

However, the data center manager is remiss if, when it becomes clear that difficulty looms, nothing is done to correct the situation.

Crisis can be avoided. What is required is the ability to see it coming and the willingness to do whatever is required to correct the situation. Discipline, firmness and control are the watchwords in these situations.

Murray is director of management information services for Rayovac Corp., Madison, Wis., and author of Management Information Systems as a Corporate Resource, *published by Dow Jones-Irwin.*

Software fads: Costly waste or valuable resource?

HUMAN CONNECTION
Jack Stone

There is an unfortunate side effect from the heavy sales promotion of the new multifunctional superintegrated programs for personal computers in the corporate arena — also known as Lotus Development Corp.'s Symphony and Framework — that is becoming chronic.

Such marketing efforts inadvertently, but inevitably lead to the creation of yet another fad, and the subsequent forcing of one more instance of what I term the "maelstrom effect" on the part of the personal-computer-obsessed users, especially managers and executives. This situation evolves when users, however guileless, are swept up into a whirlpool of enthusiasm for the latest and greatest personal computer technology, virtually irrespective of knowledge or need, fervently believing that without it, they will not reach the quintessential zenith of their productivity potential. This results in a soaring demand for expensive software — one copy per system if the license specifications are adhered to — and more personal computer power including hardware add-ons, training and ongoing systems support. The end results? In a number of cases, dollars are wasted and, even more important, the efforts of scarce technical talent are dribbled away in providing ongoing support.

Now then, along with everybody else in the business, I am a devout believer in the expanding of computing capability when the need exists. But when the costs in terms of systems outlay and follow-on support become extravagantly large relative to computing gains, then the procurement brakes should be applied and the maelstrom attenuated until saner heads can prevail.

The good old days

Let's take a look at a few numbers to make the point. We will first harken back to those good old personal computer days of yesteryear, days of 64K bytes of random-access memory (RAM) and twin 160K-byte floppy disk drives — which, lest we forget, continue to do a journeyman's job for a very large population of users. The move into the realm of Lotus' 1-2-3, for example, typically requires an upgrade to 256K-byte RAM (or equivalent RAM/read-only memory combinations) plus twin 320K-byte drives. Add up the cost of software and hardware increments, and one is staring at a bill of around $1,000 per system. If we toss in the extras of training and ongoing systems support, something on the order of a $2,000 investment per single-user machine — double the hardware/software costs — is not overstating the situation. Now, if we take as a model an organization with a hundred machines installed — all candidates for upgrading — the final tally approaches a ballpark estimate of $200,000.

Now let's start with that number as a base, and take a look at the Symphony upgrade. One can perhaps sneak by with a 512K-byte RAM and the same disk drives, but I don't think that configuration is realistic, and even if it were implemented, I think that users would shortly come back to the negotiating table, demanding 640K-byte RAM and a hard disk. This latter upgrade plus software comes in at about $2,000 per machine, and, if we add in the same amount as above for training and support, we arrive at a rough estimate of a $4,000 investment per single-user machine. For the hundred-machine organization, the price tag for the upgrade from Lotus's 1-2-3 to Symphony is a whopping $400,000.

I am not suggesting that the superintegrated programs are not of great utility for business users. What I am saying is that decision makers have to discriminate legitimate need from opportunistic fadism before committing a company — and its hard-earned cash reserves — to an applications programming system of this complexity and expense. ‡

VIEWPOINT

Micro standards in, innovation out

READER'S PLATFORM
Ira H. Krakow

The era of standard microcomputer hardware and software has arrived. Hardware and software selection has been reduced to the ritual of brand name recognition. Vendors have concentrated on high-budget advertising and slick packaging, instead of on product quality and user needs. The result is that today an innovative product without a multimillion dollar marketing budget is doomed to failure. A mediocre product with a multimillion dollar budget may succeed if the competition is not IBM or AT&T, both of which sport multibillion dollar budgets.

Suppose you've been given a four-month project of recommending microcomputer hardware and software for your company. Your boss has told you to determine user requirements, research the market for the latest products and perform a cost-benefit study to determine which configuration is best. Do you need to do all this? No. Do the following:

- Spend an hour browsing through any of 100 computer magazines. Be sure the paper is sufficiently glossy and the cover story is something like "Morticians Use Micros to Cut Embalming Costs." Try to read an article. Note that the first page (which consists of one column of the article and three columns of advertising copy), is followed by 15 pages of advertisements.
- Strike up a conversation at the water cooler with secretaries. Ask them what the label on the word processor says.
- Your research done, pick from this list of products:

Microcomputer. Anything with the IBM Personal Computer logo on it.

Disk drives. Get a 10M-byte hard disk. If your budget allows, any multiple of 10M bytes will fill the bill.

Memory. Pick a number — divisible by 64 — between 256 and 640.

Integrated spreadsheet. Buy Lotus Development Corp.'s 1-2-3.

Database management software. Ashton-Tate's Dbase III should do.

Word processing package. If a secretary said Wang in response to your question, choose Multimate. Otherwise, choose Wordstar.

- Take a well-deserved four-month vacation in the Bahamas.

This scenario, while tongue-in-cheek, is uncomfortably close to the truth. The much-publicized shakeout in the microcomputer industry has affected all of its components. There is a glut not only of IBM [Personal Computer-compatible] computers, but also of spreadsheets, data base management systems, word processing packages, diskette drives, hard disks, add-on boards, computer books and magazines.

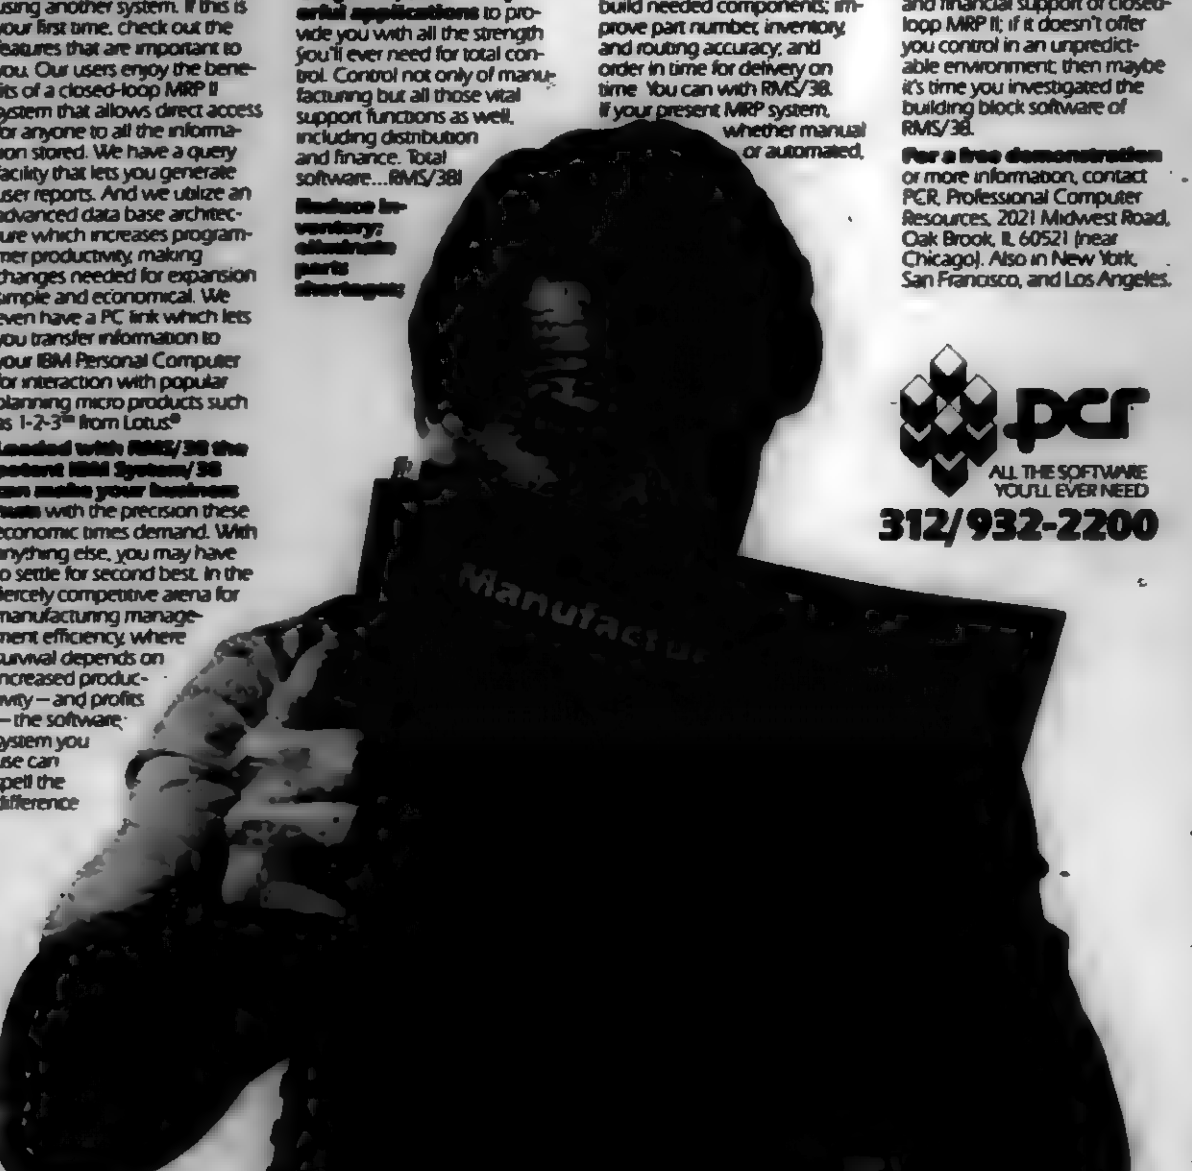
The result of this glut and uncertainty has been a retreat to brand name loyalty and a low tolerance for new ideas. This is understandable. A product that has been around for a while and has a substantial user base is probably relatively bug-free. The vendor (particularly if it's IBM) stands a better chance of sticking around.

Even well-established vendors with big advertising budgets, such as Lotus and Ashton-Tate, have had problems convincing the marketplace to accept the idea of all-in-one integrated software, as embodied in Symphony and Framework.

What chance does an innovative microcomputer product have nowadays? Regrettably, a very small one. Microcomputer standardization has become a barrier to creativity. ‡

Krakow is a Stoneham, Mass.-based independent microcomputer software consultant and the author of Lotus 1-2-3 Self-Taught for the IBM PC *and* Managing Projects Using the IBM PC.

For a tighter grip on manufacturing productivity... grab hold of RMS/38



Not many IBM/38 software packages offer tight-fisted MRP control. Perhaps you already found that out by using another system. If this is your first time, check out the features that are important to you. Our users enjoy the benefits of a closed-loop MRP II system that allows direct access for anyone to all the information stored. We have a query facility that lets you generate user reports. And we utilize an advanced data base architecture which increases programmer productivity, making changes needed for expansion simple and economical. We even have a PC link which lets you transfer information to your IBM Personal Computer for interaction with popular planning micro products such as 1-2-3™ from Lotus®

Loaded with RMS/38 the potent IBM System/38 can make your business hum with the precision these economic times demand. With anything else, you may have to settle for second best. In the fiercely competitive arena for manufacturing management efficiency, where survival depends on increased productivity — and profits — the software system you use can spell the difference between satisfaction or frustration, maybe even success or failure.

Only RMS/38 has 15 powerful applications to provide you with all the strength you'll ever need for total control. Control not only of manufacturing but all those vital support functions as well, including distribution and finance. Total software...RMS/38!

Reduce inventory; eliminate parts shortages; acquire time for skillful buying; schedule production based on demand, not parts availability; determine whether to buy or build needed components; improve part number, inventory, and routing accuracy; and order in time for delivery on time. You can with RMS/38.

If your present MRP system, whether manual or automated, represents something less than a total integration of business and manufacturing systems; if it doesn't offer the distribution and financial support of closed-loop MRP II; if it doesn't offer you control in an unpredictable environment; then maybe it's time you investigated the building block software of RMS/38.

For a free demonstration or more information, contact PCR, Professional Computer Resources, 2021 Midwest Road, Oak Brook, IL 60521 (near Chicago). Also in New York, San Francisco, and Los Angeles.

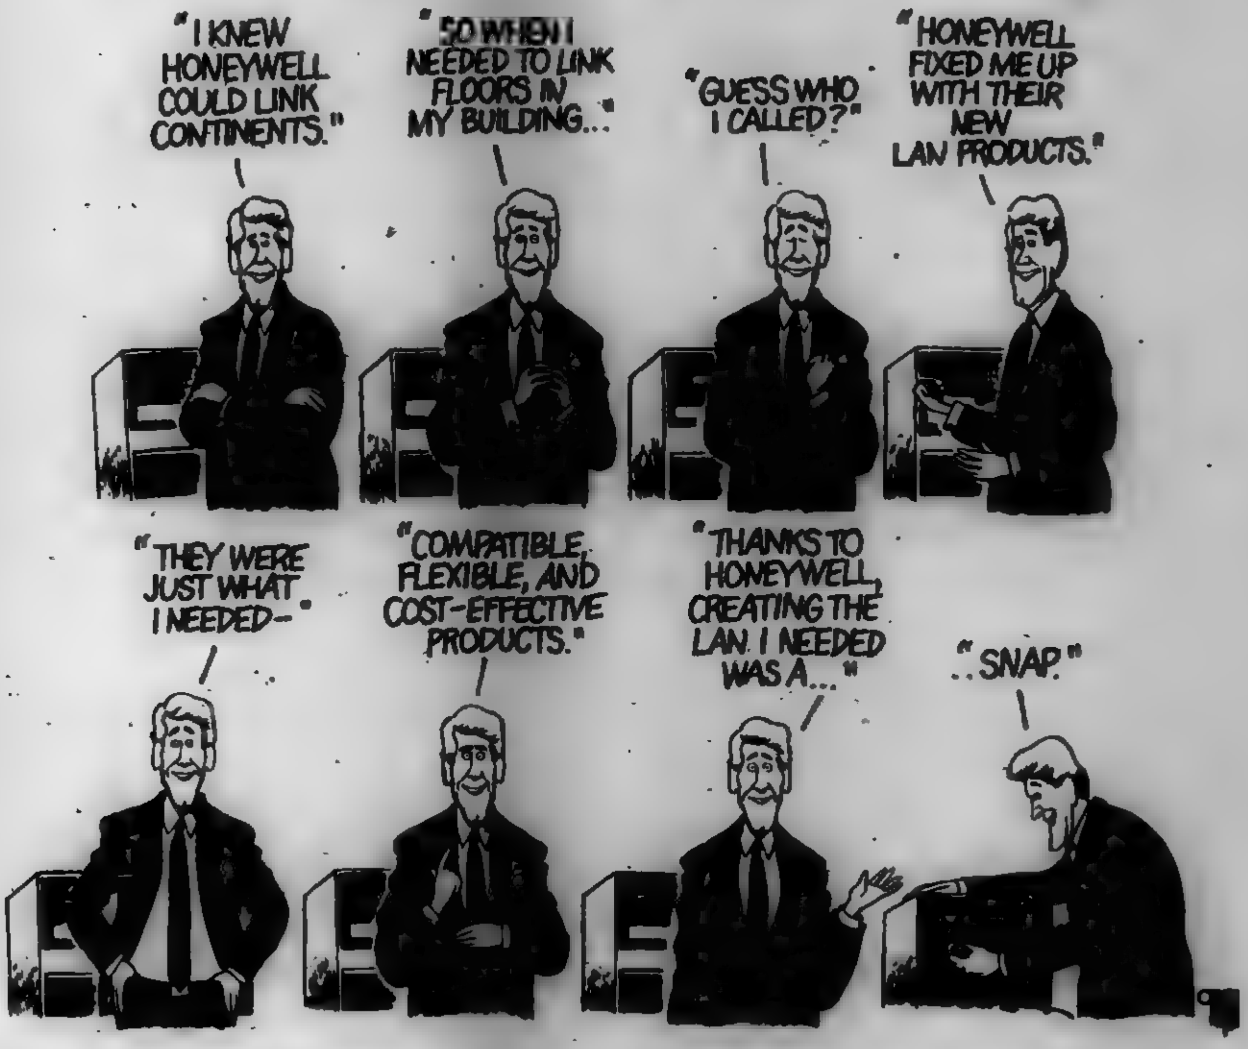
"How Honeywell makes linking 3 floors or 3 continents a snap."



"I KNEW HONEYWELL COULD LINK CONTINENTS."
"SO WHEN I NEEDED TO LINK FLOORS IN MY BUILDING..."
"GUESS WHO I CALLED?"
"HONEYWELL FIXED ME UP WITH THEIR NEW LAN PRODUCTS."
"THEY WERE JUST WHAT I NEEDED–"
"COMPATIBLE, FLEXIBLE, AND COST-EFFECTIVE PRODUCTS."
"THANKS TO HONEYWELL, CREATING THE LAN I NEEDED WAS A..."
"...SNAP."

Introducing Honeywell's Local Area Networking Products.

Honeywell has long been a leader in providing advanced networking and communications capabilities.

In the 70's, we offered better ways to link resources on different continents. Today, we're offering better ways to link resources on different floors, even between different buildings. Honeywell's Ethernet Product Line gives you this capability. It's just what you'd expect from a leader.

Honeywell's Ethernet Product Line is modular, cost effective, and complies with important industry standards. It also provides the flexibility you must have when you need to increase the number of users in your network, or when you need to link single terminals with more than one host. And these state-of-the-art, local area networking products make it easier to disperse the benefits of distributed processing throughout your organization.

Now you can link synchronous and asynchronous terminals, professional work-stations, and minis with multiple hosts. All on one network. And you can link into Value Added and Public Data Networks.

The whole product line is compatible with Honeywell's Distributed Systems Architecture and our entire selection of network products.

Its modular design lets it grow as your requirements grow. It offers an almost unlimited array of configuration options. It even helps reduce wiring and telephone line costs.

So, for the solutions to your local area networking needs, or for any networking or communications application – look to Honeywell. For more information, call toll free at 1-800-328-5111, extension 2725. In Minnesota, call collect 1-612-870-2142, extension 2725.

Together, we can find the answers.

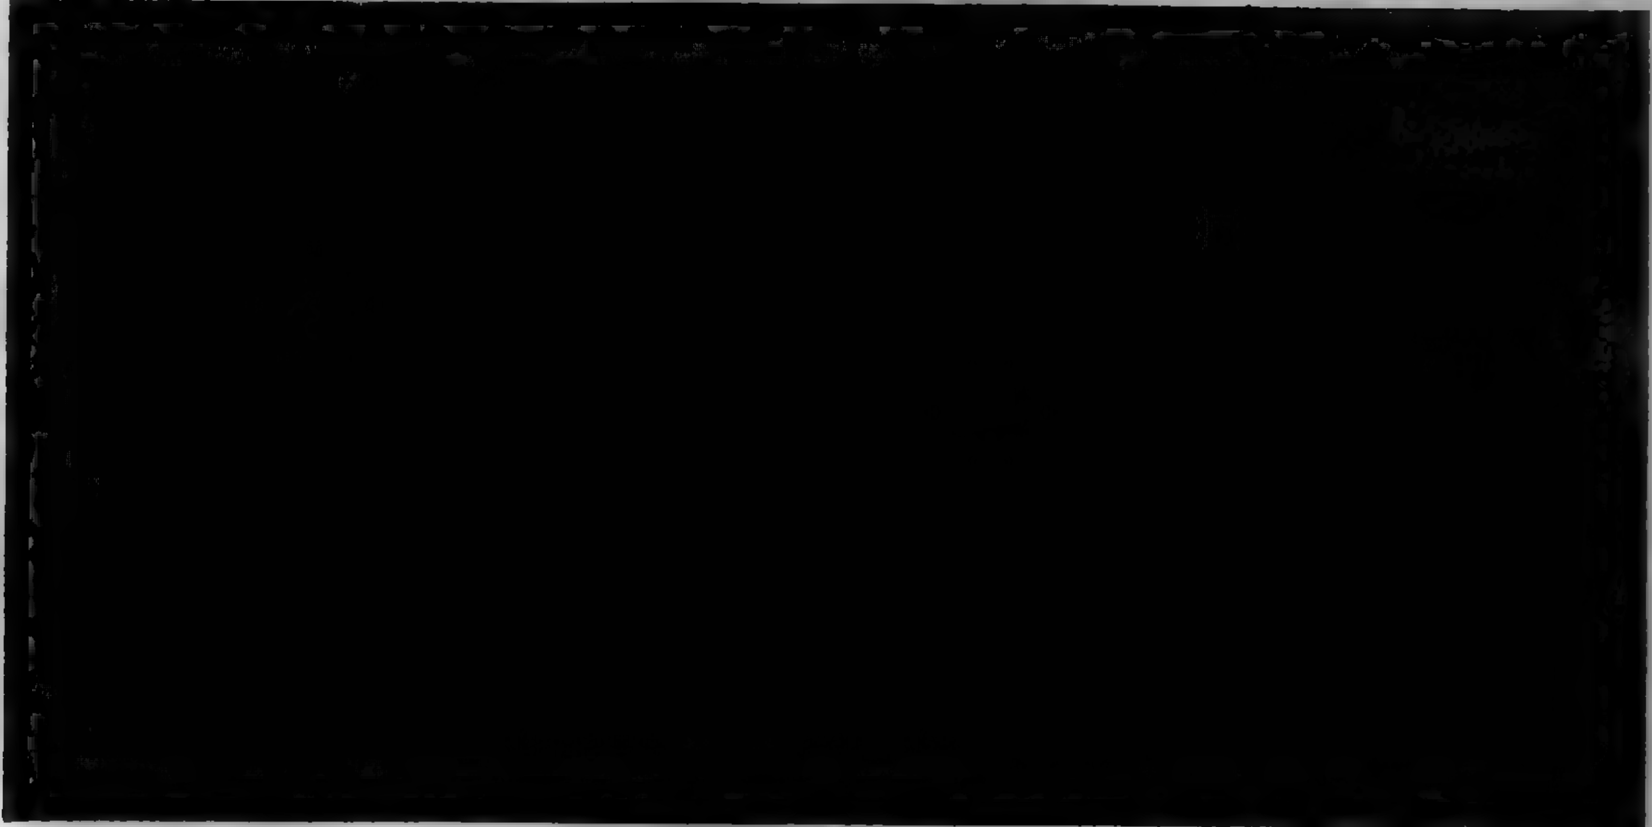
Support Systems For the Executive

A Look at Five Installations



By Eliot Levinson

Executive support systems are currently the high fashion for senior managers. This article describes the realities of development and impact of executive support systems in five large firms. The focus is on five key elements that must be managed for these systems to be effective:

1) A business problem or vision that defines the purpose of the system.

2) Sponsorship by a senior executive.

3) The organization of MIS computing groups as effective support organizations that translate managerial needs into technical systems.

4) A well-defined, accessible data base.

5) Resistance as the new systems change established procedures and reporting relationships.

Companies initiate executive support systems for three reasons: to solve a business problem, to make executives more efficient or to signal to the organization that technology should be employed. A distinct difference in development and use exists between use of an executive support system in firms where it is initiated as a problem-solving tool and firms where it is brought in for other reasons.

The problem-solving systems begin small in number of applications and number of users and then grow. They gradually evolve into planning systems. The efficiency systems begin with a larger number of users and atrophy. At the end of two years, only the problem-initiated systems survived. Distinction between the two types of systems is the relationship of the executive support system to the core of the business.

The business problem is most important during the early stage of system development. Two of the systems in this discussion were established as crisis responses by new chief executives, who were looking to the new technology for an effective solution to serious problems.

Smokestack was losing $250 million a year, and the chairman asked for a system that would allow him to control costs.

At Wellness, sales had decreased substantially, and the CEO wanted a data base that would allow him to shift the company to an analytic marketing orientation.

At International, the division head knew that unless the company could come up with a clear strategic plan and find better ways of communicating financial information, it was headed for hard times. He looked to executive support systems as a possible way of averting serious problems.

Clear expectations of the system's capabilities and benefits to the firm by the executive sponsor play an important role in its early development and ultimate utility. At Wellness and International, the sponsors defined their problem or organizational vision clearly and manageably so these issues were addressed. In both cases, a "critical success factors" process was used with a small group of top managers to clarify goals and specify the type of information executives needed. This process also served to establish a sense of mission within the organization.

At Smokestack, the function of the support system was initially more ambiguous. The early prototype focused on cost problems, but there was no clear direction because several other problems were apparent at the same time. It was not until two years and three pilots later, when executive support focused around the budgeting process, that the system began to function.

At Manuco and Toy, the executive support system was not linked to business problems. Although Manuco had several long-standing business issues caused by its competitive situation, these were not employed as a catalyst for the executive support system. The only expectation set by the chairman of Manuco was that senior executives should experiment with information technology and provide an example for people below them in their organization to use it. At Toy, the president wanted a machine for the 30 vice-presidents and their secretaries that would help them communicate and manage their time better. In comparison with the effectiveness systems, the initial expectations of these systems were low, as they supported tasks peripheral to the core needs of the business.

Installation phase

As implementation evolves through and beyond the installation period, the original business problem is not as important as in the organizational phase. During the installation phase at Wellness, the support system evolved to include more applications and become useful at lower levels in the organization. The focus of the system moved from present problems to planning of future products, and a component for the sales organization was added. At International, several financial, competitive and nonfinancial data bases were added to the initial support system, and the executives of the divisions were put on the system.

Initially, executives use the support system to retrieve the management reports they used to receive in hard copy. As the support systems evolve and their staffs develop competence in using decision support tools, the systems are increasingly used for "what-if" queries and scenario building.

At Smokestack, the evolutionary design was subject to trial and error. Since the initial goals of the executive support systems were ambiguous, a series of support systems were developed for various executives, including an executive personnel system, a pricing model, a management reporting system and a plastics division model. None of these systems was totally successful, and they reflected the chairman's lack of precision in his initial call for executive support. They did, however, serve to expose senior executives to some of the possibilities of information technology.

The approach to executive support systems at Manuco and Toy during the installation phase could be termed the "portfolio approach." The information systems departments provided a range of applications such as electronic mail, calendars, word processing, spreadsheets, automatic dialing and corporate reports. The rationale was that with a wide choice of applications, the executives would find something useful. At both firms, a significant number of executives utilized electronic mail, though a lack of participation on the mail system at Toy limited its use. Over time, use of the communications tools diminished, and only a small number of people used them.

The difficulty of implementing the efficiency systems can be attributed to the fact that senior executives have satisfactory support in the form of executive secretaries and assistants, and subordinates respond to their demands quickly. On the other hand, business-problem-based systems provide value-added information about a core concern of the business.

Institutionalization phase

During the institutionalization phase, the *raison d'etre* for executive support systems shifts from a business crisis to a combination of monitoring business health and looking toward the future.

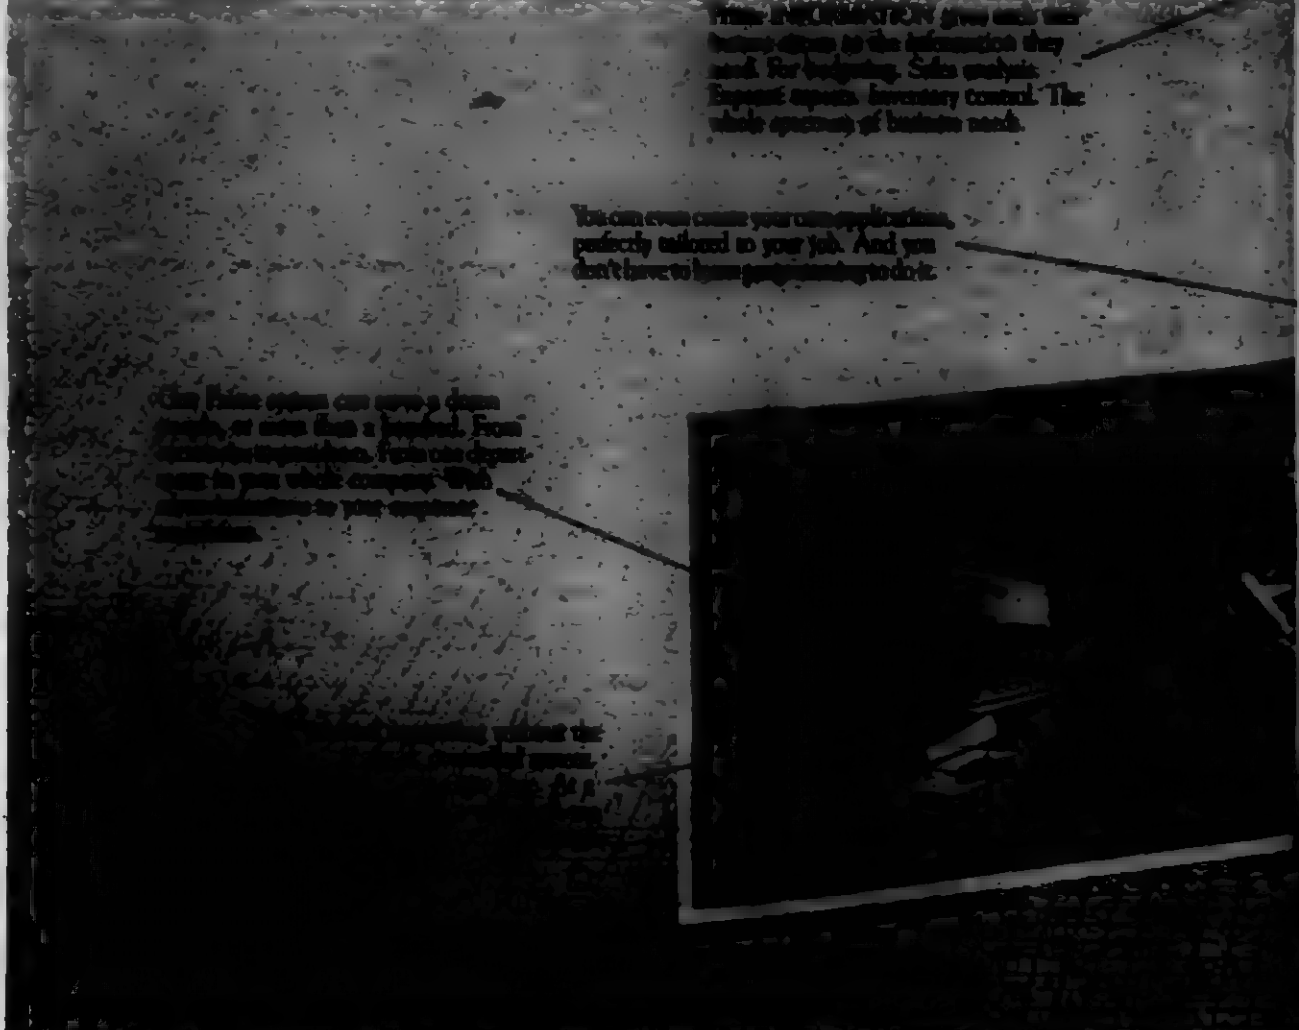
At International, the president has used the executive support systems in assessing new ventures as a way of avoiding the decline of old products. At Wellness, the executive support system is being used to make decisions about new product development.

Another aspect of executive support in the institutionalization period is its linkage to core organizational processes. At Smokestack, it is utilized in the budgeting process, at International in strategic planning and at Wellness in marketing and sales. It is interesting to note that those executive support systems that were not institutionalized were not linked to any core business function.

Sponsorship is the initiative role the senior executive plays in the design, development and use of support systems. The executive's participation makes more of a mark on the implementation of executive support systems than on any other element in the initiation and execution of executive support. The sponsor's functions include:

Finally, personal software for big computers. Prime INFORMATION.

No, it's not a PC. It's one of many terminals connected to a single, powerful Prime® system. What makes it personal? The revolutionary Prime INFORMATION™ software.



Prime INFORMATION [illegible] to the information they need. For budgeting. Sales analysis. Expense reports. Inventory control. The whole spectrum of business needs.

You can even create your own applications, perfectly tailored to your job. And you don't have to learn programming to do it.

One Prime system can serve a dozen people, or more than a hundred. [illegible] From one department to your whole company. [illegible]

[illegible] without the [illegible]

- Initiating the demand for executive support systems.
- Establishing an organization to implement them.
- Defining the purpose.
- Developing usage.
- Utilizing outputs.
- Moving the systems through the organization.

In the firms we researched and worked with, there have been a variety of patterns of sponsorship that include executives who view executive support systems as an essential management tool and those who see them as peripheral.

There are executives who participate in the design, development and evolution of the system, while others delegate it to the information systems department. There are those who define the purpose of the system very early, while others discover its utility during implementation.

> *After saying, "I want one," the next step was defining what "it" was. At this stage, there was a variety of responses by the sponsors.*

The sponsorship role changes during the life of the support system. Initially, the titular sponsor, that executive who called for the system, is most important. As time moves on, an operating sponsor, the person delegated to manage the installation and diffusion of the system, becomes most important.

Organizational phase

The titular sponsor's motivation to call for executive support systems is spawned by two situations: the combination of a crisis he wants to solve and being new to the job; or a desire to have executives utilize computer technology as part of their daily work.

The titular sponsors in this study were divided into two categories. Those who called for effectiveness systems were all new to their jobs. They were looking for information to aid them in the solution of some problem, to provide a quick understanding of how the organization functioned and to bring about organizational change. The sponsors who called for efficiency systems had been in their jobs longer and were motivated by a generalized desire to have other senior executives demonstrate modernity and work more efficiently by using technology.

After saying, "I want one," the next step was defining what "it" was. At this stage, there was a variety of responses by the sponsors. At Wellness, there was a problem-solution support system match. The CEO and his top managers went through a critical success factors process and defined the information needed to analyze their markets, assess performance of their products and link the two to their sales territories. This exercise articulated a clear vision of where the management team was heading in aiming at high-profit margin items.

At Smokestack, the chairman and the head of decision support utilized a similar problem-solution match to develop a prototype system for cost control, but no other executives were involved. At International, the "discover as you implement" approach was used in defining the system. The comptroller, who had been developing accounts receivable and forecasting applications, and the new CEO, who was trying to find a way to communicate financial information easily, requested that a computer graphics system be linked with the data base.

At Manuco and Toy, the CEOs defined the support systems through delegation. At Manuco, the chairman stated that he wanted a computer on every group executive's desk, symbolizing to the rest of the organization that senior management was using technology. He then delegated sponsorship of the project to the information systems organization.

At Toy, the president asked an engineering group and then the MIS group to find a communications tool for senior executives that would combine a telephone and computer tools to help them with their management. In both cases, the titular sponsor saw the support system as technical support and delegated its definition to technical organizations. This approach was in sharp contrast to the other three firms where the titular sponsors saw the systems as management tools and involved themselves and other executives in defining the systems.

Operating sponsorship

The role of sponsorship shifts from the titular sponsor to the operating sponsor as the task changes from envisioning the support system to installing it and evolving its usage within the organization.

The role of operating sponsorship is best demonstrated by its absence. At Smokestack, the chairman delegated installation of the project to the chief financial officer, who resigned, and then to another vice-president, who was not interested in the system. During this 15-month hiatus, the computing group initiated a series of less than successful support systems for division heads and various vice-presidents. A new chief financial officer was appointed who implemented a management reporting system for the group vice-presidents that had been stalled by his predecessor, and then the computing group, under the auspices of the chief financial officer, developed a model to be used by all groups in the budget process.

IN DEPTH/EXECUTIVE SUPPORT

Sophisticated knowledge of computer technology was not necessary for effective use of the support system by senior executives. The systems incorporated menus, touch screens and fourth-generation languages.

This model allowed the chairman and chief financial officer to look at the relationships of the various groups as a value-added chain, something they had previously been unable to do. The budgeting model is becoming the executive support system as it allows senior management to look at individual businesses and their relationship to each other, which is the current central problem of the firm.

The comptroller at International represents a good example of operating sponsorship. He acted as the gatekeeper between the computing group and the president, made decisions regarding applications development, linked the support system to the strategic planning process and executed all of the applications so they were usable by other executives. As his primary contribution, the comptroller directed the financial analysts in learning to develop and utilize the executive support systems. He was also instrumental in diffusing executive support systems usage downward into the various divisions of the group.

Sophisticated knowledge of computer technology was not a necessary condition for effective use of the support system by senior executives. The executive support systems were very easy to use, with such features as menus, touch screens and fourth-generation languages.

During the installation phase, the executives learned to utilize the technology, usually beginning with retrieval of the standard reports they had received in hard copy. When more demanding tasks, such as querying and modeling, were needed, the executive had the system chauffeur-driven by one of his staff. The CEOs at Wellness and International both stated that executive support systems gave them an understanding of the dynamics of their businesses they had never had prior to the systems' installation.

Directors to users

During the institutionalization phase of executive support systems, the sponsors became more users of the system's output and less directors of its development. By demanding a coherent set of information within an easily accessible, defined framework, these sponsors had driven the organizations under them to hire and train managers with computer skills who spent a significant part of their time inputting data for the system. At both Wellness and International, line managers and staff analysts adapted their work to the support system.

During the institutionalization period, there are two processes that occur: the executive support system is diffused to other parts of the organization where new sponsors must adapt them to their needs; middle management has to fit analyses and reports into the framework of the support system in answering requests of superiors.

The importance of new sponsorship can be seen at International. The MIS group disseminated the tools developed in the original division to another group. The group executive did not perceive the financial management tools as linked to his job, so what had been an executive support system became a middle-management efficiency tool, helping the financial analysts in the new group to get their work done faster.

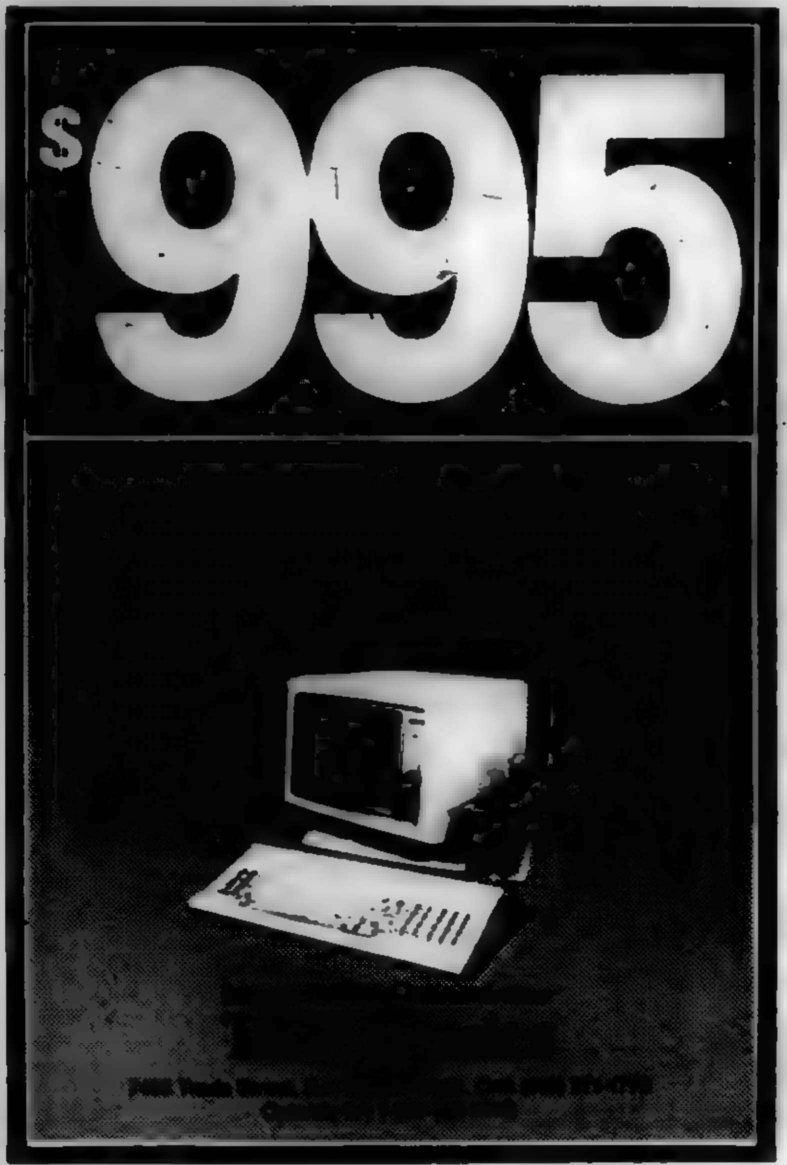
At Wellness, and in the original group at International, the division heads and middle managers were highly affected by the executive support systems. The systems imposed a discipline on the types of questions senior executives asked of their subordinates, which in turn demanded that middle managers utilize computer-based skills and begin thinking in the framework of the executive support systems.

In the three firms where problem-oriented executive support systems were established, the middle managers perceived their advancement as linked to their ability to utilize decision support tools.

End-user tools

Executive support systems are end-user computing tools. The sponsor plays the key role in defining the use of the system so that it is used as a management tool.

There were two patterns of sponsorship that delineated whether the executive support system was ultimately useful as a management tool. One group of sponsors, exemplified by either the titular or operating sponsor in the effectiveness groups, saw the executive support system as an extension of themselves and participated actively in its design and



Saudi Computerworld is your link to the Saudi Arabian computer market.

The Saudi Arabian computer equipment market was worth $78 million in 1981. Researchers forecast a total market value of $222 million by 1987. The market is well-developed with computers, minis and mainframes, in virtually every sector. Government and related public organizations represent 50% of the market.

Now you can reach this valuable market with *Saudi Computerworld*. As part of *Computerworld's* worldwide family of computer publications, *Saudi Computerworld* shares in the largest international computer information network. It is a monthly bilingual (Arabic/English) magazine circulated to 12,000 DP professionals in the computer user environment in the Gulf Peninsula. *Saudi Computerworld* reports on news and ideas of interest to small and large computer users in business, industry, government, and educational organizations.

CW International *Marketing* Services gives you one-stop advertising service in countries around the computer world. For more information on *Saudi Computerworld* or any of our other foreign publications, just fill out the coupon below.

the establishment of an organization to implement and manage it. Systems implemented under these sponsors reached full implementation. The other group delegated the design of the system to others, giving the message that it saw executive support systems as technical support rather than as a management tool.

There are two constructs that should be considered in understanding sponsorship. The first is that business crises or visions create effective sponsorship; the second is that some executives, the *co-opters*, view the technology as a valuable phenomenon that must be turned to their advantage, while others, the *victims*, do not understand it and therefore manage it by delegating it to technical groups and do not involve themselves in the process of implementation.

Computing groups

The role of computing groups is central to executive support systems throughout the life cycle of implementation. The structure of the group, its relationship to management and the approaches it uses in developing the support system at different stages of evolution significantly impact the effectiveness of the support system.

Executive support systems present MIS with the extremes of the problems and opportunities associated with end-user computing. The perceived power differential between general managers and MIS staff, combined with the differences in the nature of managerial and technical work, affect the process of defining and implementing easy-to-use but complex support systems.

In the various approaches that MIS or management take, there are three key factors to be controlled that affect implementation: problem definition, the type of executive support system presented as the solution to the problem and the organizational sponsorship. When all three factors are addressed, as in the case of management-generated support systems to solve a defined problem, the implementation process will move most effectively to meet expectations. When these expectations are not well defined, the executive support system is less likely to be effective.

There are three types of information systems organizations associated with executive support systems: the data processing group, the segmented group and the integrated group. The data processing group includes the data center, office automation, decision support systems and development. The segmented group is made up of DP, systems development and end-user computing. The integrated managerial group would typically consist of end-user management and end-user computing.

The DP group differs little from the groups that constructed transaction processing systems a decade ago, but they have since absorbed new technologies, including office automation and decision support. The DP groups approached executive support systems as a traditional systems development effort. These groups were staffed by people with strong technical backgrounds who had a product orientation. They took full delegated control of the projects rather than sharing decision making with management and placed major emphasis on the development of hardware. The DP groups concentrated their effort more on the early phases of the project rather than on installation.

In the segmented MIS organization, the end-user computing function is autonomous: Data processing is handled by one group, systems development by a second and user-controlled technologies by a third.

End-user computing groups differ from traditional DP groups in several respects:

- They are service rather than product-oriented. Their role is to help the end user accomplish his aims and establish the most appropriate hardware and software environments in which to do this. They do not "control" the system. From the outset, it is clear that decisions concerning use of the system come from the end user. In two of our cases, it was decided prior to beginning work to build a turnkey system for the end user.
- End-user computing groups are staffed by people with a business background, or project teams are set up to include end-user management.

INTRODUCING THE BURROUGHS B25.
THE MICRO COMPUTER
THAT GROWS WITH YOUR BUSINESS.

Buying a computer is a lot like hiring an employee. You need one that can produce a lot now and even more in the future.

Take the B25. It's modular, so when you need more memory or storage, you simply snap on more modules.

Another feature that allows the B25 to grow with you is its ability to network. You just add workstations and people will be able to share the same data and memory at the same time.

You can also share peripherals—like printers. Which means several workstations can be linked to one printer so many people can use it.

What's more, the B25 has three operating systems (CP/M-86,® MS-DOS,™ BTOS) so you can run the most popular software available today.

And, of course, the B25 is backed by Burroughs' worldwide service and support.

The Burroughs B25. You wouldn't hire a person who couldn't grow with your business. Why buy a computer that can't?

THE QUESTION ISN'T WHO'S BIGGER.
IT'S WHO'S BETTER.

MS-DOS is a trademark of Microsoft Corporation. CP/M is a registered trademark of Digital Research, Inc.

At the manufacturing firm, executive support was given to an engineering group within the management systems organization, which then developed technical specifications for personal computers to be used by executives.

- End-user groups use an evolutionary design process that starts with a prototype and adds applications incrementally, as opposed to the traditional DP process of developing the system fully before usage.

The integrated MIS groups report directly to management as members of the executive's staff and have only a "dotted-line" relationship to the MIS organization. None of the groups we studied started as integrated groups, but they evolved that way as implementation of the executive support systems progressed.

The staff within the integrated group is more managerial than technical in background and demonstrates consulting skills. However, they have a strong background in computer tools. They view information technology as the tool to accomplish a primary business task, such as financial planning or marketing.

The differences and similarities between the groups can be seen in their definition of and approaches to implementing executive support systems at different stages of development.

Determining need

The main task in the early stages of executive support systems is defining the problem to be worked with and choosing appropriate hardware and software. At Wellness, the end-user computing group interviewed several subsidiary presidents to find a situation where an executive support system would meet a need. The group found a subsidiary where the new CEO was looking for a tool to change the focus of the company from sales to marketing.

Critical success factor interviews were conducted among the four senior executives to determine what information was needed and then a prototype of the marketing support system was developed. At this point, Wellness committed the funding for the project and management, jointly with the end-user computing group, chose Express as the language for the executive support systems. A member of the end-user computing staff was assigned at Wellness.

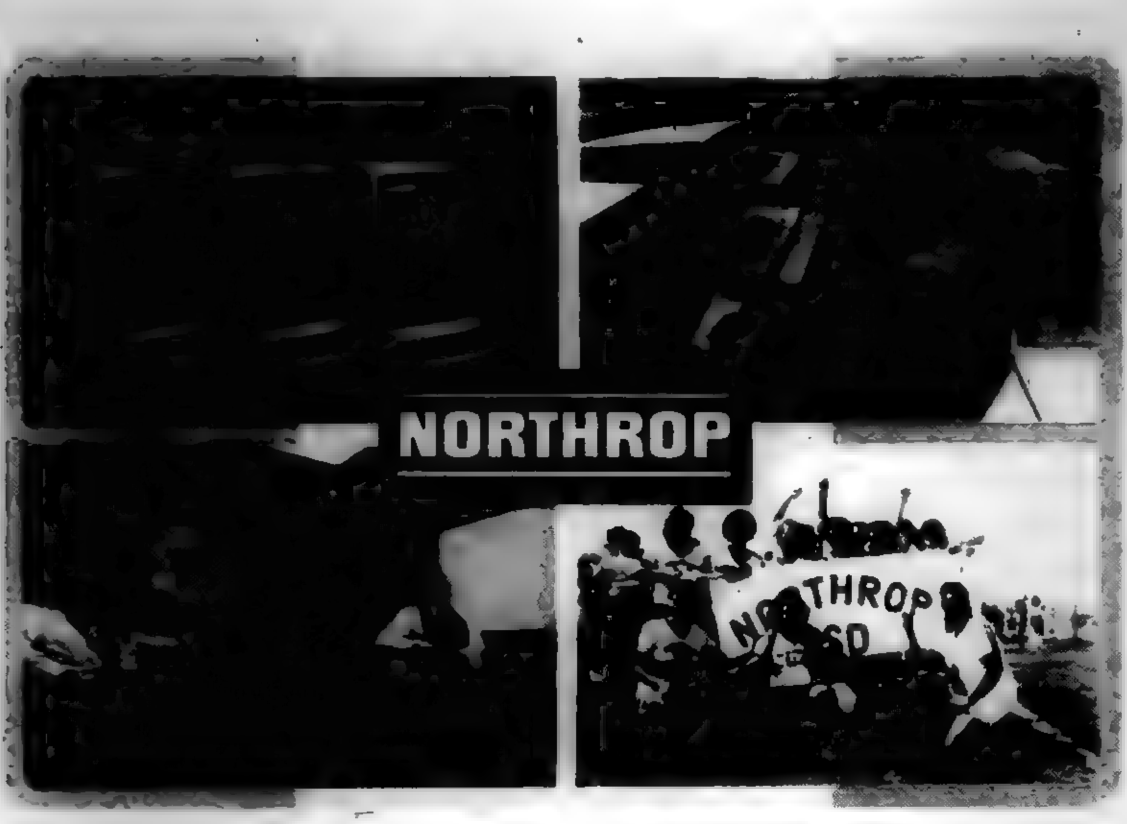
In contrast to Wellness, at Manuco, executive support was given to an engineering group within the management systems organization, which then developed technical specifications for personal computers to be used by executives. The project was then given to a newly formed marketing group within the information systems group, which developed applications for an executive workstation. After the hardware had been ordered, the marketing group interviewed the 18 executives and their secretaries who were designated as users. Unfortunately, they found out in the interviews that the hardware did not meet the work requirements of the executives.

The main differences between the approaches of the DP groups and the end-user organizations were as follows:

- DP groups emphasized hardware, whereas the end-user organizations concentrated on problem definition and software.
- The DP groups were delegated or took control of the project, whereas the end-user groups shared decision making on the nature of the support system with line management.

Installation phase

In the installation stage, the task of the computing groups is to get the system functioning and work through start-up problems,



Data Processing Professionals:

WE BRING COMPUTER TECHNOLOGY AND PEOPLE TOGETHER

Northrop DSD, as a leader in the electronics industry with annual sales of $250 million, continues to grow to meet the needs of its customers. Outstanding opportunities are available to those business data processing professionals who aspire to share in our commitment to excellence and advanced state-of-the-art technology.

WE OFFER:

- Environment utilizing an IBM 308X running MVS and IDMS Data Base Management System; CICS command level; COBOL
- Outstanding growth potential
- Competitive starting salary and full range benefits package, including tuition reimbursement, savings plan (401K), relocation assistance, generous vacation plan, health and dental coverage

The software picture

There are three categories of software used in executive support systems. The majority of executive support systems are custom-tailored, built from general-purpose decision support languages. The common software used for these systems are:

Management Decision Systems, Inc.'s Express; Information Builders, Inc.'s Focus; Mathematica Products Group, Inc.'s Ramis and Boeing Computer Services Co.'s EIS.

In the majority of firms with which we have worked, the company places considerable emphasis on choosing the language and then builds its own system.

Category II — Executive support systems. There are now specialized systems for executive support that are targeted at senior executives and are distinguished from the generic systems in their visual emphasis.

Category III — Communications and management support.

Digital Equipment Corp.'s All-In-One comes under this group. IBM's Professional Office System and Computer Corp. of America's Comet 204 are used more by middle and lower-level managers for general managerial support. However, these systems are used by senior executives for electronic mail and communications.

---

modifying the system so it is a real utility to the users.

International presents a typical example of where an end-user computing group worked on a parity basis with management, supplying half the manpower to teams developing different applications. After developing a prototype of a financial data base with a financial analyst, the computing staff went on to develop a nonfinancial data base, an accounts receivable package and a competitive data base. They also helped select a graphics package, but their choice for graphics was not the one finally picked by International's management. The computing group at International combined a strategy of evolutionary design with participative decision making by the management group.

In contrast to International, the computing groups at Manuco and Toy were delegated more responsibility, but they had less authority over the installation of the executive support systems. To cope with the ambiguity, the groups used a portfolio approach to the project. At Manuco, the MIS group decided that executives and their secretaries would use word processing, calendaring, electronic mail, document transfer, the Dow Jones & Co. News & Retrieval Service, corporate reports and spreadsheets. They put all these applications on very easy-to-use menus and provided individual training to all the executives and secretaries involved.

Their rationale was that out of the sumptuous buffet of software, the executives would choose something. Although secretaries did use the system, only four executives used it regularly and the computing group was unable to get access to the executives to train them — or to divisional data that might have been of assistance to the executives.

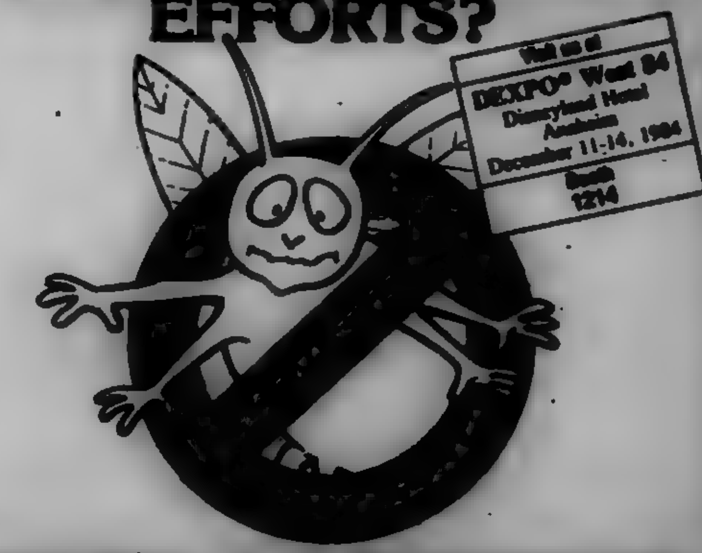
Another aspect of the DP group's approach was an emphasis on the computer interface. At Toy, the hardware, which was a combination of telephone and computer, took only an hour to learn to use, and at Manuco, considerable effort went toward establishing one-button access to any application faced with low usage. As a solution, the computing groups continued to expand the portfolio and the number of installations.

With both the end user and DP groups, emphasis was placed on user training during the installation phase. At International and Wellness, the computing group saw its function as developing expertise within the executive staff, and at Manuco and Toy the emphasis was placed on user-seductive software that could be of immediate utility to the executive.

At Smokestack, an effort was made to provide executives with easy-to-use management reports. The training efforts were more successful when aimed at staff people rather than at the executives themselves.

During the institutionalization phase of implementation, the tasks for the computing groups are to disseminate the system either downward, so it diffuses within the

ARE BUGS PLAGUING YOUR PROGRAMMING EFFORTS?



RXVP80™ IS A BUGBUSTER

RXVP80 finds bugs in your FORTRAN programs before you do!

It also documents your programs for you and tells you what parts of your programs aren't executed when they run. All this in terms of your source code. RXVP80 is as easy to use as your compiler and is available on most superminis and mainframes including DEC VAX and IBM equipment.

RXVP80 has an established track record for increased productivity, quality error-free software, on-time software deliverables, and decreased maintenance costs for large and small companies around the world.

A Flow General Company

organization, or across other divisions and to establish a standardized environment for operation of the system.

The efficiency-oriented communications systems ceased to exist after the installation phase. At Manuco and Toy, the support systems had been labeled as pilots, and both firms declared victory and ceased operation. At the other three firms, the support systems became embedded within the organization.

In all three firms, the computing groups moved toward being more integrated into the user organization. At Smokestack, the computing group moved from de facto reporting to MIS to reporting to the chief financial officer. At International, the comptroller's staff took over operation of the support system, and the computing group disseminated the applications to four other divisions. At Wellness, the computing organization lost its reporting independence from MIS but became fully integrated within subsidiary management.

At both Wellness and International, the support system affected the jobs of middle managers and analysts within the organization, and training programs were established to provide these managers with the necessary skills in use and growth of the technology. At Wellness, the increase in breadth and depth of the system necessitated a reconstruction of the data base, and that job was given to the computing group.

At Smokestack, the integration occurred around a central corporate-wide budgeting process. The computing group, as delegate for the chief financial officer, developed a budgeting model that affected all groups in the corporation. The computing group is currently in the process of training the various financial staffs in use of the tool.

In summary, the computing group is an important factor in executive support, since it affects the implementation at all stages and has considerable daily contact with the nuts and bolts of the system. The role of the computing group changes during the process of implementation from problem definer to implementer to maintainer and diffuser of systems. The computing groups that were most successful appear to have shared decision making more with management than those who were delegated more responsibility for the implementation.

The discussion of computing groups as a factor illustrates the problem of separating factors. It is obvious that the kinds of management sponsorship and problem definition greatly affect the role of the computing group. It is no coincidence that computing groups were more effective when business problems catalyzed initiation of the system and managerial sponsorship was active. However, the ability of computing groups to capitalize on these opportunities depends on their structure and skills.

The existence, usability and development of data bases were major factors in building executive support systems. Existing data bases were a necessary but not sufficient condition for the installation stage of the effectiveness-oriented systems and became important again in the institutionalization phase. The preexistence of a community of users is as necessary a condition for communications-oriented support systems as data bases are for business problem-based systems, because being accustomed to the technology speeds the implementation process.

The existence of data bases and a community of users demonstrates a seeding of technology within the firm that prepares it for the growth of support systems. During the last phase of implementation, data bases become important as diffusion of executive support systems from one division to others and to the corporate office demands the creation of a data warehouse and the establishment of common conventions surrounding data management.

Business problem-based executive support systems demand the presence of information on which alternative scenarios for decisions can be made against past performance, and categories of information may be compared with each other. In two of the firms we studied, Wellness and International, the use of information technology was well developed. Managers had apparently been exposed to information technology, and historical data bases on matters central to the firm were usable.

In contrast, information systems had been given very low priority at Smokestack prior to the arrival of the new management. At the beginning of the implementation process, the computing group found that all financial accounting had been decentralized to the subsidiaries, rendering financial data incomparable. The centralization of accounting practices and the development of a common general ledger system were necessary before financial data could be developed for an executive support system.

The development of these systems took 18 months and made the initial concept of a cost-control executive

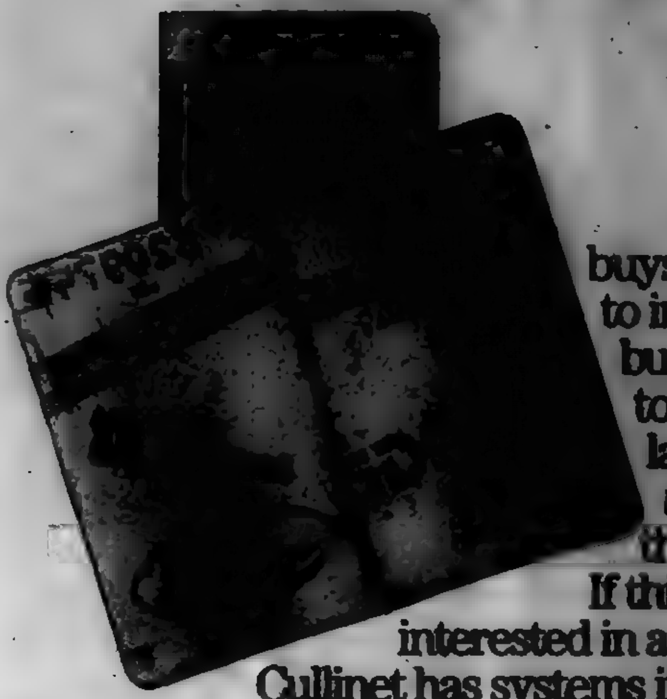
With Cullinet applications, there are no boundaries to what your company can accomplish.



It's an all too common problem. Manufacturing buys an application, and data processing is expected to integrate it with the corporate database. Finance buys an application, and data processing is expected to integrate it, too. And so it goes. Three years later, the job still isn't finished. And the ideal of a *true* database management system is still just that—an ideal.

If this problem sounds at all familiar, you'll be interested in a way to avoid it altogether—Cullinet.

Cullinet has systems in four application areas—financial, manufacturing, human resources management and banking. Each is a functionally superior product in its own right—which, of course, is a primary concern to the people who use them.

Even more important, each is built on the same foundation—our IDMS/R database. Through it, each is able to share data with every other Cullinet application. And that's something no one will appreciate as much as data processing.

By eliminating the boundaries between modules, we've eliminated the problems typically associated with applications software—duplicate data, multiple updates, file conversion and the like. The result: efficient processing throughout the company.

And if this integrated approach is the main advantage, consider also that our applications were built using ADS/OnLine, our powerful fourth generation language. This makes them easy to install and tailor.

For more information about our applications and our complete approach to information management, attend a Cullinet Seminar. You can make arrangements by sending in this coupon, or by calling, toll-free, 1-800-225-9930. In MA, phone 617-329-7700.

The Complete Software Solution

Cullinet: I'd like to learn more about your applications.
Please arrange for me to attend a Cullinet Seminar.

THE FUTURE OF 2400 BPS MODEMS IS LOOKING UP.

And so is yours.

Because compared to 1200 bps modems, our 2400 bps modems can effectively double your productivity. Without doubling your costs.

How?

Simple. 2400 bps modems do everything twice as fast.

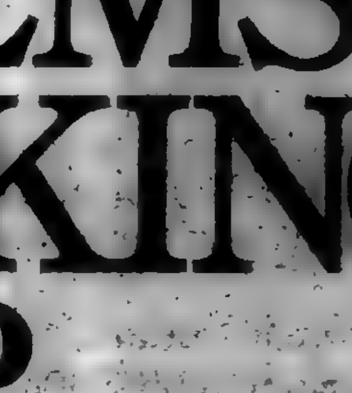
You can fill a screen in 8 seconds instead of 16. Transfer a full floppy in 24 minutes instead of 48. And cut your line costs in half by staying on the line half as long.

But more important, all this productivity is now worth the price. Because the prices of Racal-Vadic 2400 bps modems have just come down.

Now it doesn't cost twice as much to go twice as fast.

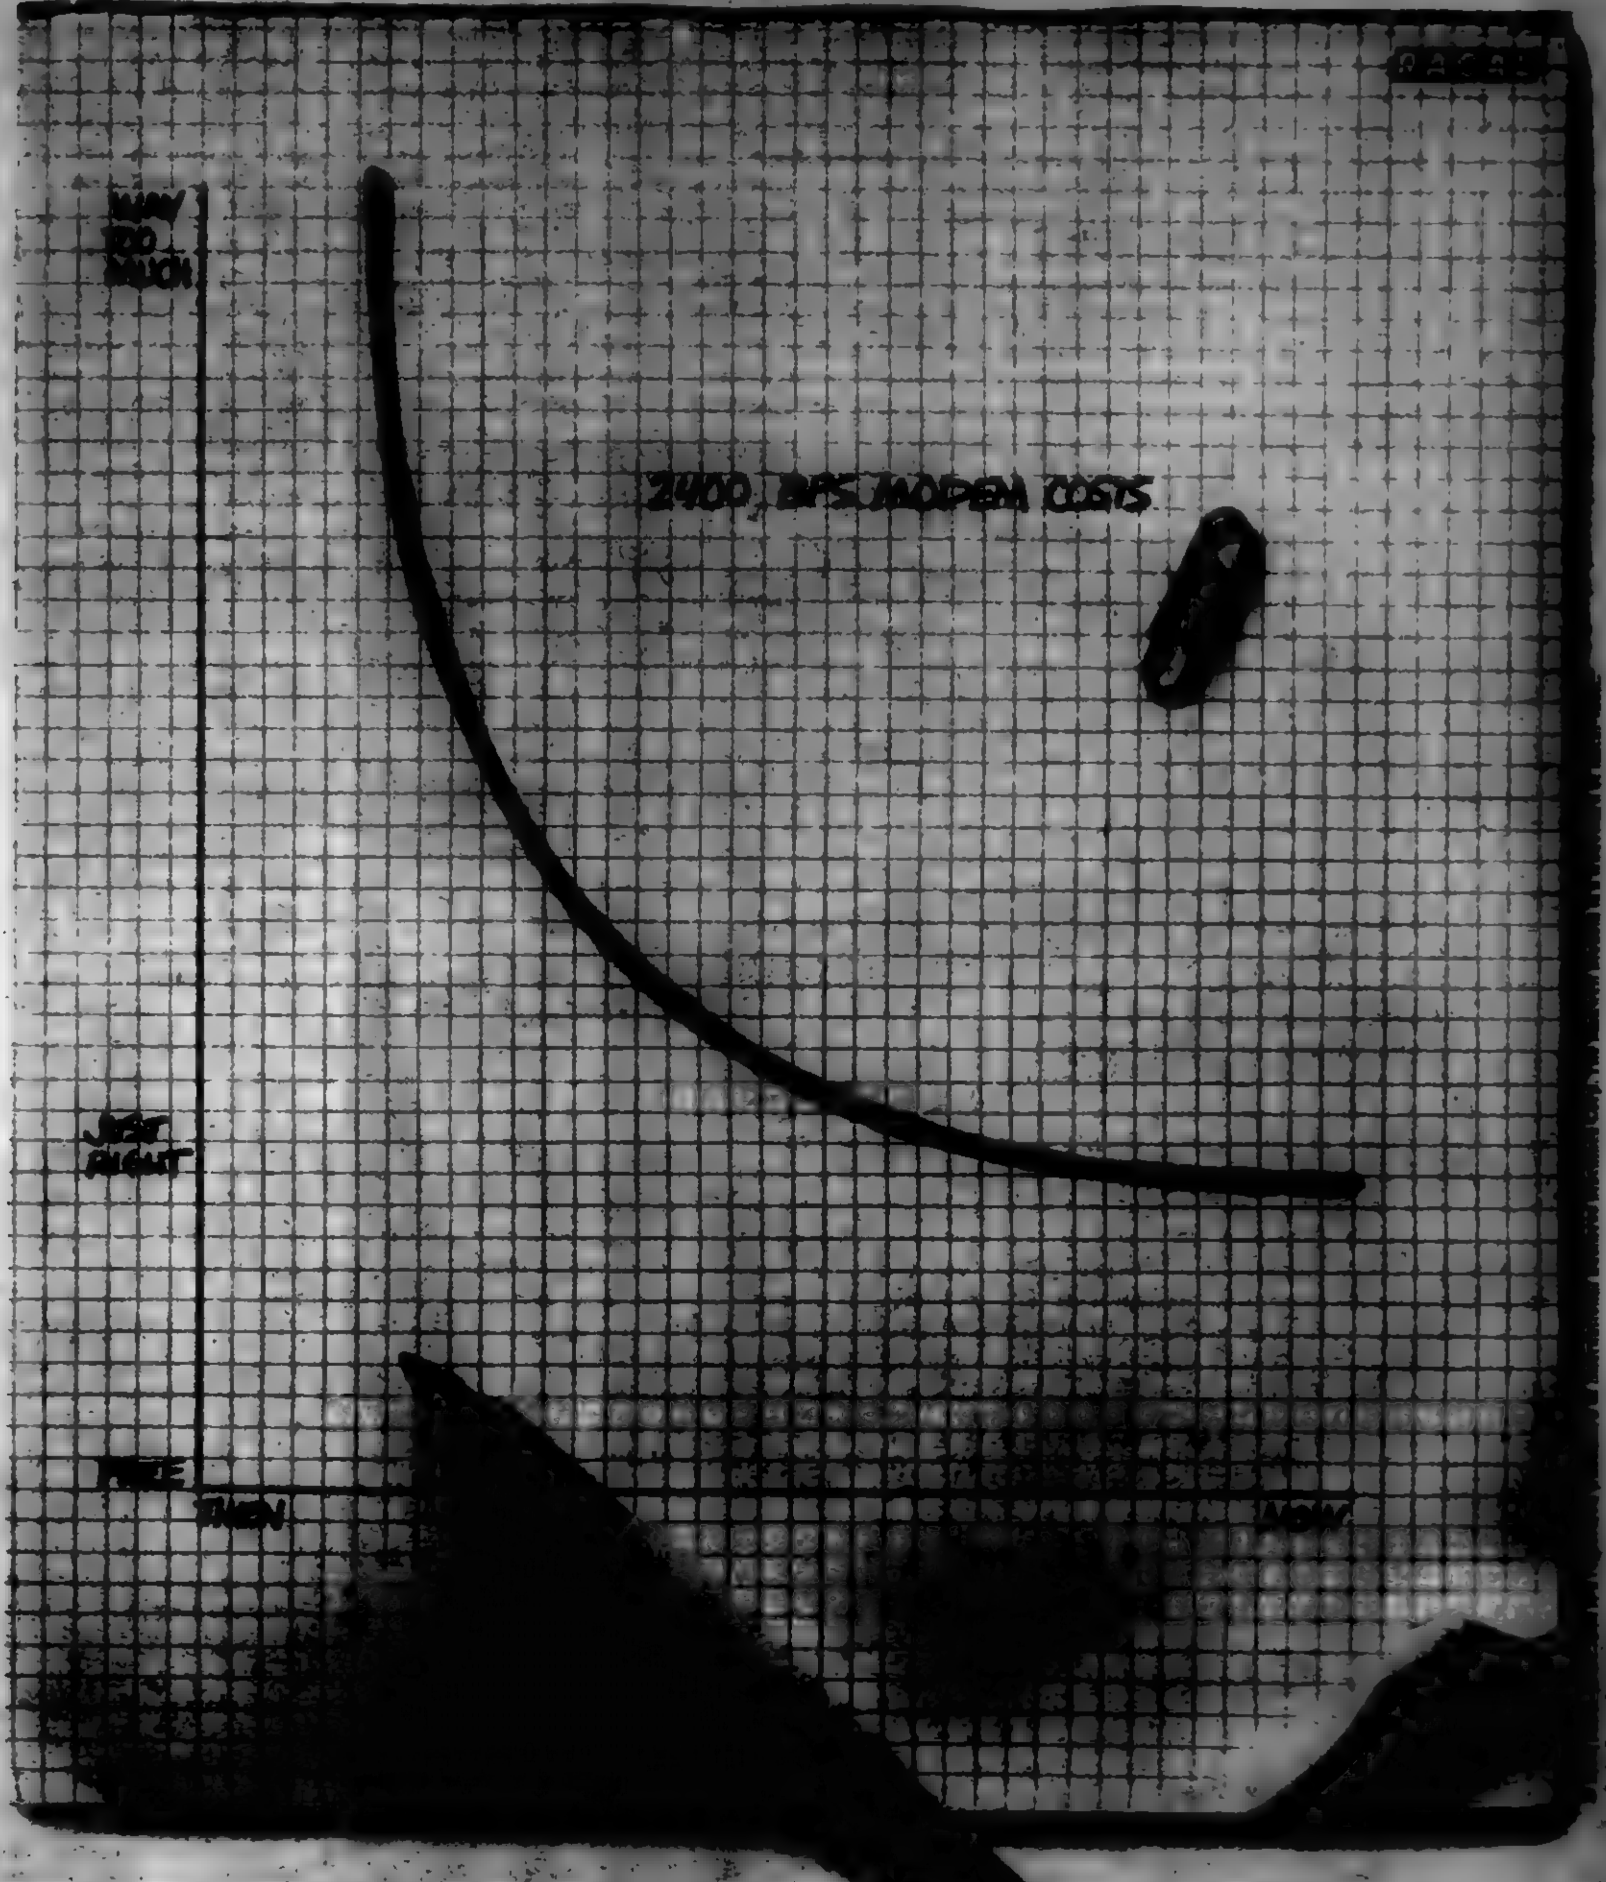
In fact, you'll find very attractive prices on all five of our 2400 bps modems.

Including our high-density rack-mount. An international modem. Two desktop types. One of which is our top-of-the-line model. It can down-line load and store dialing directories, log-on sequences and security passwords. And offers switch-selectable synchronous/asynchronous communications.



There's even a new internal modem for the IBM* PC that's so uncomplicated even the person who wrote this ad can use it.

They all offer standard



features like remote diagnostics, automatic dialing directories and complete unattended operation.

But unlike other 2400 bps modems, all ours switch automatically between 2400, 1200 and 300 bps. So you can keep in touch with those less far-sighted than yourself.

Now that you've had a look at the future, here's how to get there.

Call 800-543-3000, Operator 507. In California, 408-946-2227.

Or write if you have the time. Racal-Vadic, 1525 McCarthy Blvd., Milpitas, CA 95035.

Racal-Vadic

Makers of The Maxwell Modem.™

support system unfeasible. Smokestack was able to establish a management reporting system and then a budget model only after the data requirements between divisions had been standardized and the consolidated reporting system needed for the data base was established.

With communications-oriented executive support systems, the executives need to be linked with the people with whom they communicate. If the people in the executive's communications community do not use or are not on the system, then the executive cannot gain the benefits of using such efficiency-oriented communications tools as electronic mail. At both Manuco and Toy, it was found that executives communicated downward to their subordinates. Support systems were organized horizontally to other executives, and subordinates were not originally on the system. The structure limited the systems' potential utility.

Manuco provides a good example of what occurs when data bases cannot be compared or utilized across different groups. The firm had more than 50 separate divisional and staff data bases, but they could not be used in concert. This situation caused considerable difficulty for the policy-oriented group executives, who complained that the executive support systems could only be of help to them in their work if they could utilize and compare information across divisions and groups. This example illustrates why three of the firms spent considerable time and effort in selecting data base management systems that created relational data bases.

The data bases for executive support systems are often, though not exclusively, extracts of corporate transaction systems. During the institutionalization period, executive support systems diffuse into other divisions and staffs, and usage within corporate subgroups increases. It is necessary to establish corporatewide systems that allow for easy transfer of data.

Two firms that reached the institutionalization stage have approached the problem of standardization by establishing corporate data warehouses from which data can be extracted for individual support systems and setting up common data base management systems that all divisions and subsidiaries must use.

Managing resistance

Resistance to new technology is a normal phenomenon. It can be either an act to protect one's domain or simply a reluctance to change without proof that a new way is better. Resistance to executive support systems occurred during the installation period in all the companies studied. It took the form of avoiding the system, actively resisting it and withholding. Resistance can slow down or cripple installation of an executive support system. Where the executive support systems were installed well, resistance was effectively managed.

In efficiency-based systems, the resistance took the form of nonusage. Toy Electric provided a good example of this passive resistance. The executives already had good support in place: secretaries to pass and screen their messages and administrative assistants to do budgets.

The resistance was expressed by both secretaries and executives. In responding to questionnaires, they said the system was fine and asked for minor modifications, but they didn't use it, because the questionnaires addressed interface rather than compatibility or work issues. In this way, the systems satisfied the perceived desire of the CEO to provide a personal management tool, and then the staff proceeded to work as they liked. At Wellness, the problem of nonusage was dealt with by the president himself, who invited other executives to attend training sessions with him.

Active resistance was evident at Smokestack. The decision support group developed an easy-to-use query system for the vice-president of personnel. He used the system for three weeks and then gave it to his own systems person to operate. The systems person claimed that the new system was inadequate and not as complete as the complex personnel information system already in existence. He was, however, the only one in the corporation who could operate the older system; the new, sim-

MCBA introduces shrink-to-fit software.

With nine years in minicomputer software, 15,000 installations worldwide and an established reputation in the mini world, MCBA is proudly shrinking its software line.

Down to micro size.

We've taken the impressive power of minicomputer software and made it available for micros. Right now.

Alter the fit? Absolutely.

Alter the functionality, modularity and capability? Not one bit...so to speak.

This new line of serious microcomputer software is by far the most comprehensive, well-tested and sophisticated in the industry today. By whose standards? Thousands of MCBA users who rank it the best in the business.

MCBA's library of 16 integrated manufacturing, distribution and accounting packages can be installed in whatever combination nd sequence a user needs r his or her business.

It grows with businesses. No matter what size they are now. Or want to be later.

And MCBA software now runs in RM/COS,® PC-DOS, UNIX™ and UNIX look-alike environments.

In other words, we've tailor-made our newest software to fit micros—as comfortably as it fits user needs.

So whether you're a dealer or a user, find out about it. Call **1-800-MCBA NOW** (toll free outside of California). In California, call **(818) 957-2900.**

MCBA's shrink-to-fit software. For growing businesses.

MCBA®

Minicomputer Software for Micros.

plier system was usable by anyone.

A third form of resistance, withholding, is based on the "information is power" principle. At Manuco, the MIS people were unable to obtain several divisional data bases that would have been helpful to group executives in policy planning, because the divisions did not want their data on a common system.

At International, the divisional presidents were reluctant to provide information for the executive support systems because they thought their autonomy would be affected. A frank discussion about critical success factors was held between the divisional executive and group president, allowing resistance to be handled by negotiation. This is a good example of how resistance can be resolved. Because participation in designing the system was high, end users perceived it as a central tool to their success rather than an infringement on their autonomy.

There are definite patterns in the relationship between the number of elements that are managed well during the implementation process and the effectiveness of the executive support systems. Wellness and International had all the elements present early and promptly and have the most successful implementations to date. Manuco and Toy had the fewest elements, the most problems and ceased the implementation process prior to institutionalization.

Organizational change

Executive support systems are often a lever for organizational change. This change tends to be associated with a new leader's vision of how the organization should function. The executive support system becomes an extension of the leader. It is one of the tools he uses in bringing about a restructuring of the organizational mission. The reports and data in the executive support systems are the message to the rest of the organization as to what indicators count, and the staff members who manage the executive support systems become the gatekeepers of information.

The relationship of executive support and organizational change was clear in this sample. The three executives who sponsored effectiveness-oriented systems had been in their jobs less than a year. They all said that after spending several months getting accustomed to their jobs, they developed a vision of where they wanted to move the organization.

At International, Peter Dewey saw a need to focus the corporation on its future. This focus meant finding ways to communicate critical information to the top of the organization and to bring the divisions in his group into line with a strategic plan. Dewey perceived the firm as complacent because of past success and unrealistic about its future. He also felt that the changes had to be brought about carefully, since theirs was a long history of decentralization of the subsidiaries and no immediate crisis to justify participants' action. He was also conscious that as a group executive he had limited staff and it was not fruitful for him to become involved in the nitty-gritty operations of his divisions.

He saw his increase in effectiveness in being able to make his divisions and the upper management of the corporation focus on strategic planning. For Dewey, the presentation form of information became very important. He felt that graphics allowed people to see trends clearly and kept them from being buried in numbers and paper.

This picture fit the role he saw for himself as communicating crucial information and goals upward to the chairman and down to his divisions. He also used the critical success factors process in bringing his division presidents into agreement with the strategic plan and established a graphics reporting system linked to that plan. Dewey's vision was one that he saw as gradually moving International to its future rather than reacting to crisis.

At this point, the divisions have institutionalized reporting, which addresses the strategic goals.

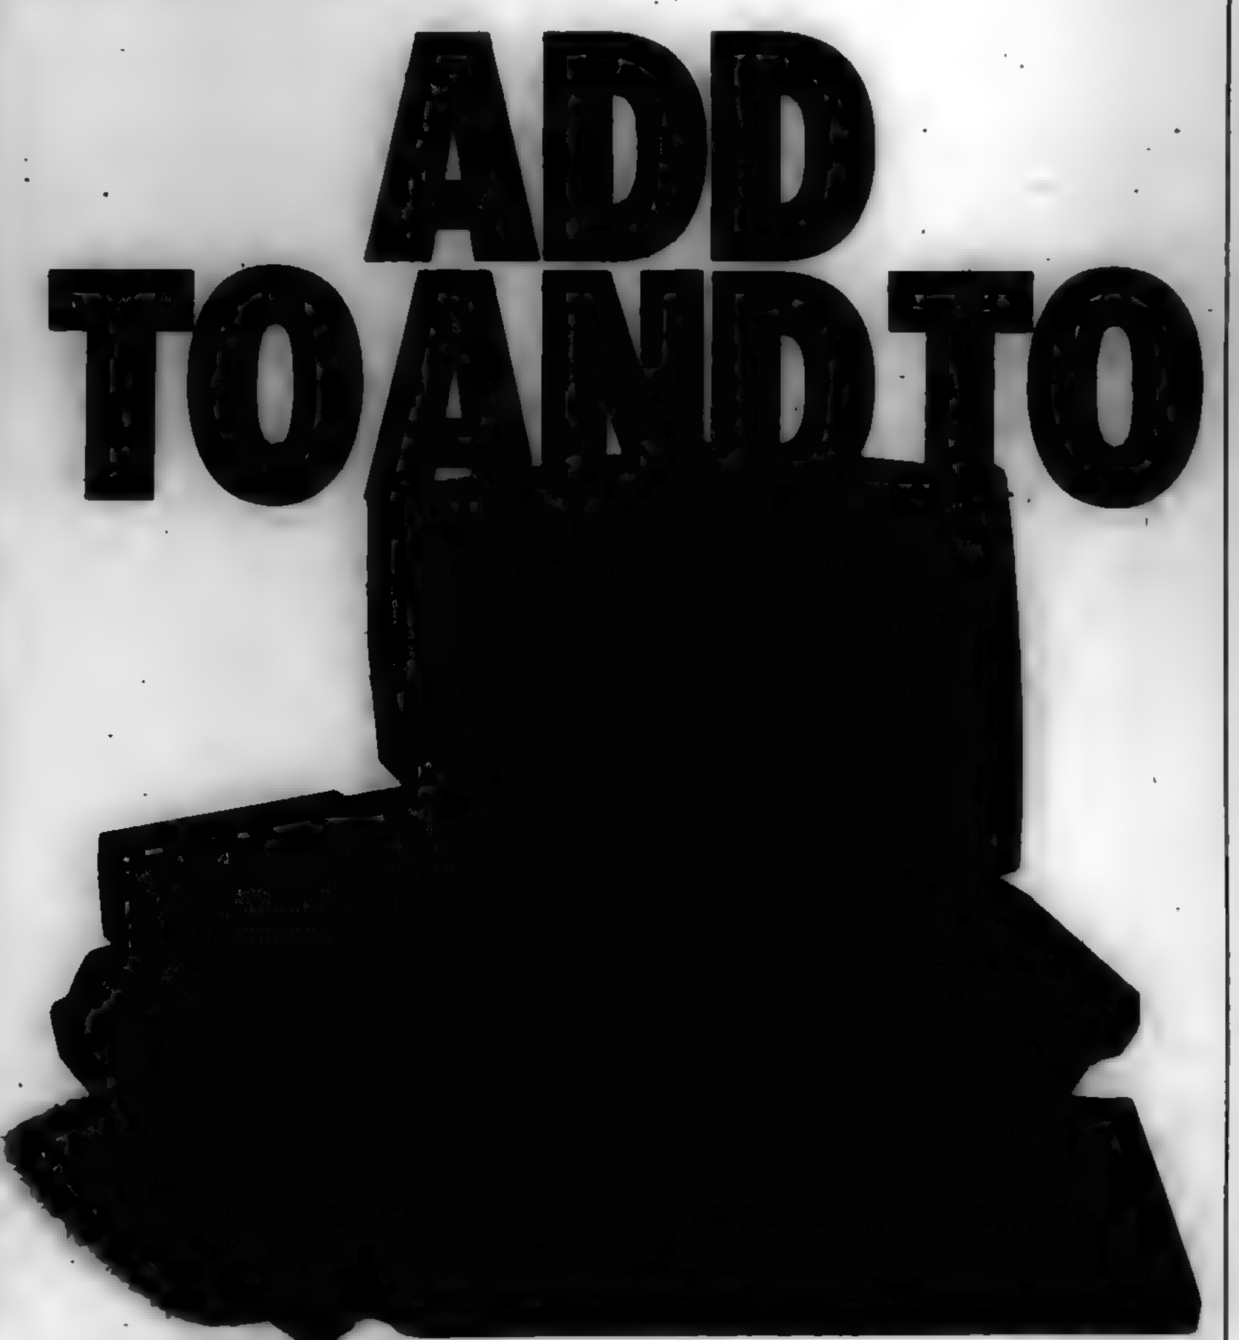
When Paul Dawson assumed the helm at Wellness, he knew that the traditional sales orientation was not working any more. Dawson had a vision of changing Wellness into a firm that was analytically marketing based. Dawson established his executive support system with a marketing data base and simultaneously established a market research group directly below him to run the system. He changed the reward system for his managers from one that granted bonuses as they met quota on any products to one that required them to meet quota on all product lines.

In the last year, Dawson has restructured the division, amalgamating units and dropping product lines, forcing them to use the system. He has also focused his sales effort on a different market segment. In Dawson's case, the executive support system can be seen as one of the tools in a tool kit for changing the operation and culture of Wellness.

It is worth noting that a significant difference between the executive support systems that are business problem-based and linked to visions of change and those that are oriented to personal management and efficiency is that the communications-based systems are not driven by a vision of organizational change. This may make them more difficult to implement because the executive is actually viewing the system as office equipment, a typewriter or dictaphone, rather than as a central part of his business.

About the author

Eliot Levinson is a visiting scholar at the Center for Information Systems Research, Sloan School of Management, MIT.



To add markets as well as profits to your business, add Zaisan to your system.

The ES.1 voice/data workstation offers single-key access to simultaneous voice, data or text. With the touch of a button, users can also access internal and external databases, PBX functions and electronic mail.

The ES.1 is also upgradeable. So you can add application and communication software to tailor the ES.1 to the individual information needs of your users. Which can add sales to your business.

Another plus is the price. And the wide range of service options.

Add these all up and you'll see the formula for success is rather elementary. Add Zaisan.

How to evaluate micro-based systems

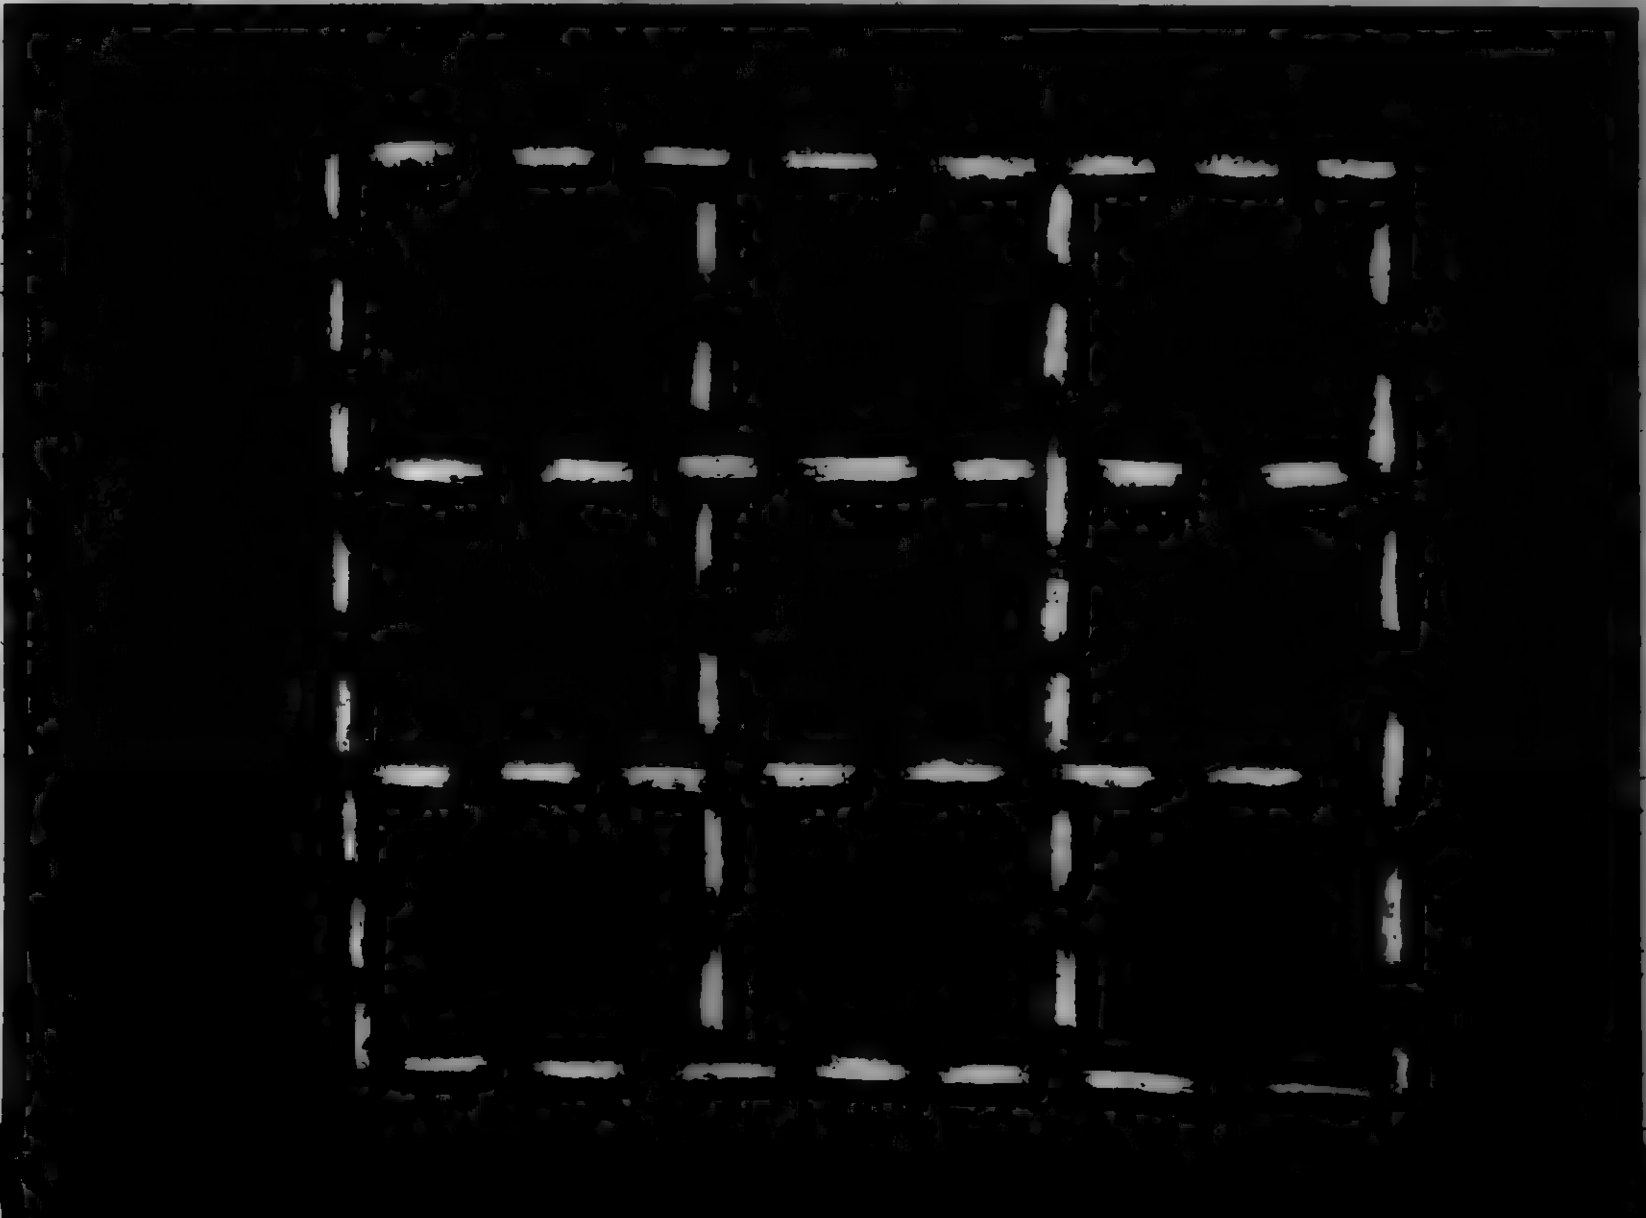
By John Saunders and Naomi Karten

To justify custom development for micro-based systems, the proposed project should be either highly unique (no packaged software available), very important to the organization (performance expectations exceed what packages normally provide) or both.

Information systems management and potential users often feel uneasy about exactly what role micros and micro-based systems should take in their organization. One sound approach is to consider a custom micro-based system for a particular application. A custom-developed system is defined here as any system that is the product of a project life cycle and that meets the unique requirements of the business for ease of use, documentation and compatibility.

The techniques and tools used during development could be as sophisticated as a high-level programming language like Pascal or C or as general-purpose as a financial modeling language. What really characterizes a custom-developed, micro-based system is the explicit recognition of the analysis, design and development stages of its creation.

Up to now, most of us have assumed that a micro best serves the needs of an individual. This



view recognizes that the micro can focus considerable processing power on a specific problem.

When used with general-purpose software, this power is easily applied to a wide range of specific needs. The analyst who works with a large amount of financial information can use a spreadsheet package every time he needs to prepare a worksheet. The manager who must prepare a large number of reports can rely on a word processing and graphics package to generate high-quality copy. In both cases, however, the user applies a general-purpose tool to the specific tasks he faces.

However, micros can also serve other purposes within an organization, extending beyond the specific requirements of an individual. One theory provides a four-way classification scheme for information systems. Gordon David, in his book *Management Information Systems*, describes all information systems within an organization as being either personal or public, as well as formal or informal. These classifications account for automated or manual, mainframe-based or micro-based systems.

> *Given the processing and memory capacity of micros, there is no reason they should not be applied to systems in the middle levels of the systems pyramid. This is particularly true in cases where a communications link can be established to the mainframe.*

In terms of this classification scheme, an automated general ledger system would be a public, formal system in that it would serve the requirements of the organization in a formal manner. Similarly, the Rolodex file maintained by an employee is also an information system, but it would fall into the private, informal category. Such an information system clearly serves only the needs of the individual who uses it. The organization has no requirements for how the Rolodex is to be organized or maintained.

Micros have largely been relegated to the role of private, informal information systems within organizations. Most firms assume that users should have direct control over their use of a micro and that this view is appropriate since the tasks they perform are personal in this sense. The desire of some DP managers to reduce their applications backlog by sharing the burden with users drives this assumption. The assumption is encouraged by the easy availability of packaged software designed to help inexperienced users meet general needs. In a sense, the entire information center concept of supporting and advising users is intended to encourage direct user control of micros.

But while there may be strong incentives for organizations to encourage the use of micros to meet private requirements, there is no reason that micros cannot also be considered for certain public, formal systems. Keep in mind that the processing capacity of micro hardware has increased enormously in the last few years. The processor at the heart of the Apple Computer, Inc. Apple II could handle 300,000 to 400,000 instructions per second. The recently announced Motorola, Inc. MC68020, on the other hand, can process four to five million instructions per second, an increase of more than one order of magnitude in processing speed alone.

The instruction set of modern microprocessors has also become considerably more advanced, resulting in more compact and efficient programs. Similar progress has been made in main memory and disk storage capabilities. The results of these advances in technology are small machines that are in some ways as powerful as the mainframes and minicomputers of previous years.

One can think of the information systems in an organization as a pyramid. At the bottom lie the transaction processing systems, which account for the bulk of data processing within an organization and which have been the traditional realm of mainframes. At the top of the pyramid reside information requirements that are generally difficult to define and that are constantly changing. The need of a top executive to prepare a three-year business plan might fall into this category. Microcomputers used with packaged software have traditionally been applied to these kinds of decision support needs.

However, at the middle levels of the pyramid are systems that do not have the heavy transaction processing requirements of the lowest level and yet are more standardized and static than systems at the top level. These systems usually address control and short-term planning needs of a firm, take as input standard data from the transaction processing systems and produce reports that aggregate this data in a predefined way.

Given the processing and memory capacity of micros, there is no reason they should not be applied to systems in the middle levels of the pyramid. This is particularly true in cases where a communications link can be established to give the micro access to the mainframe data base for downloading information. What managers need to know, therefore, is

Realia COBOL.
Migration without migraines.

Until recently, you had to abandon the business computer language when you developed microcomputer application software. The available micro COBOLs were inadequate—too limited, too slow. The best alternative—the XT/370 or AT/370 using IBM's COBOL—was very expensive and still too slow. To get acceptable performance, you had to retrain your programmers in Pascal or C.

Realia COBOL is the cure for such headaches.

Realia's compiler supports most IBM VS/COBOL and VS/COBOL II features, such as:
- COMP and COMP-3 data
- SELECT assignment names
- Multiple entry points
- GOBACK, EJECT, and SKIP statements
- Structured programming extensions of VS/COBOL II

You can download mainframe systems for development, maintenance, and testing. Productivity will soar.

You can compile faster with Realia COBOL than in most mainframe environments, even on floppy-based systems. Compile-time options allow cross-reference, brief and full code listings, and helpful features like subscript and decimal value checks.

Our interactive debugger lets you follow the program source, display and modify data, and set breakpoints using the normal optimized machine code.

The results are startling.

Our users report that their systems run up to 20 times faster when compiled by Realia COBOL. That's compared to our nearest micro competitor. The ratio is up to 100 times faster when compared to any of the others.

On the IBM PC AT, your programs can run at 370/148 to 370/158 speed. Realia's file system really makes your machine deliver, giving it a distinct edge over Pascal or C. Our indexed file system even has full key compression and buffer controls just like VSAM. The generated code is pure MS-DOS, so it can be run on most of the 8088/8086 machine family.

And you can sell your programs without paying us a royalty fee.

Realia COBOL is priced at $995, including one year of maintenance and upgrades. Subsequent maintenance and upgrade contracts are currently priced at $125/year/copy. Available for the IBM PC, PC XT, 3270 PC, PC AT, PC-compatibles, and the TANDY 2000.

Realia COBOL. What a relief.

Why people choose an IBM terminal in the first place is why people want IBM service...in the first place.

After all, who knows your IBM terminal better than we do?

For many of our terminals we offer IBM maintenance agreements with the choice of service that's best for you—at the price that's best for you. That's blue chip service from IBM.

Take our IBM 3178 general purpose display. Some 3178 customers enjoy the convenience of IBM on-site exchange. That's where we exchange a keyboard, for example, at your place.

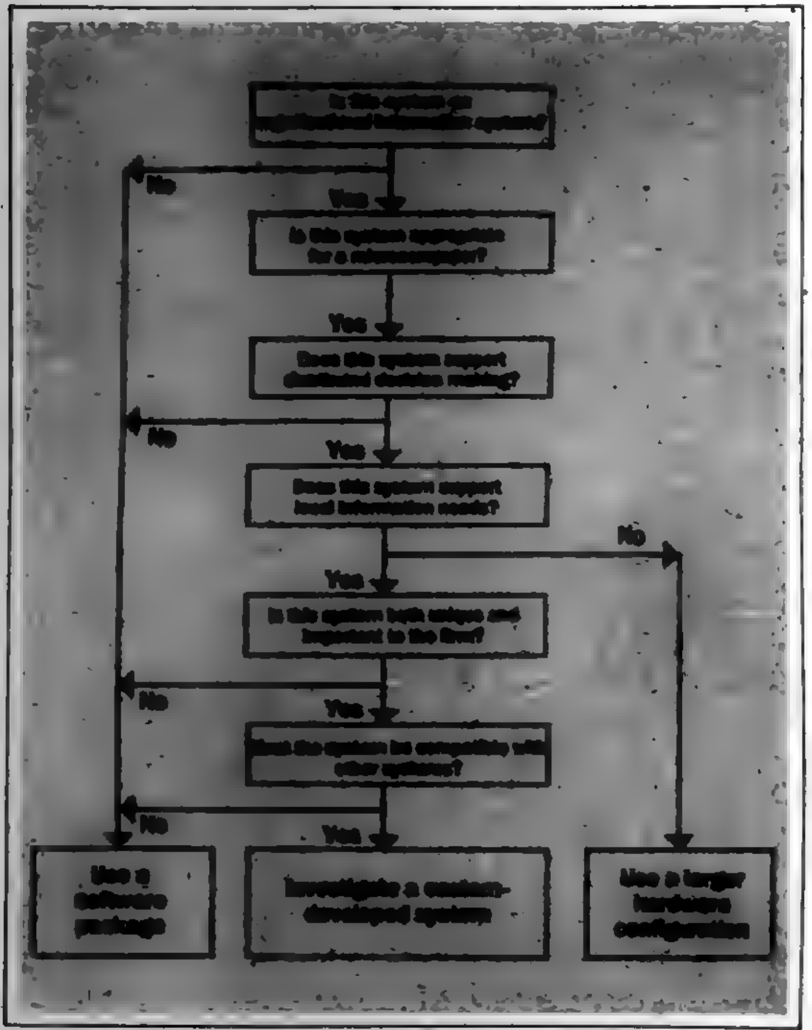
Other customers prefer the low cost of our carry-in service available through our Service/Exchange Centers.

An IBM maintenance agreement offers you fast, effective service, IBM parts and, when necessary, the benefits of our technical support network.

Quality. Speed. Commitment. That's why an IBM maintenance agreement means blue chip service.

To find out more about the specific service offerings available for your IBM terminal, call 1 800 IBM-2468, Ext. 90.

Blue chip service from IBM



Is this system an organizational information system?

Yes
Is this system appropriate for a microcomputer?
Yes
Does this system support distributed decision making?
No
Yes
Does this system support local information needs?
No
Yes
Is this system both unique and important to the firm?
No
Yes
Must the system be compatible with other systems?
No
Yes
Use a software package
Investigate a custom-developed system
Use a larger hardware configuration

Figure 1. Tests used in choosing a development methodology

how to determine when a micro is appropriate for such an application and how to approach the development of the system when that determination is made. The following sections describe a methodology for identifying systems that are public and formal in nature and good candidates for a micro-based system.

Identifying custom projects

How does one decide on a development strategy for a system that might be appropriate for a microcomputer? The answer is contained in a series of tests to which proposed applications can be put. For the purposes of these tests, the manager should assume that the menu of strategies includes developing a system on a microcomputer, acquiring a software package or using a larger computer with either a software package or a custom-designed system. Figure 1 outlines the test sequence.

1. Is the proposed application an organizational or a personal information system?

A personal information system is one that meets the needs of a single person by keeping track of data of interest only to that user and that performs functions designed and used only by that user.

Insofar as micro applications are concerned, a software package can certainly meet the truly individual needs of a manager.

If, however, the system uses data that is standardized across an organization or performs processing that is standardized across an organization, it may be thought of as an organizational information system and may require a custom development effort. In this case, the proposed application should be submitted to the next test.

> *The micro can be an effective tool for middle-level decision making because it focuses processing capacity where it is required.*

2. Is this application appropriate for a microcomputer?

This question implies a number of further tests, as follows:

2a. Does the application support decision making that is highly distributed throughout the organization?

We must ask this question in order to filter out those projects that support very centralized information needs. Such centralized decision making (such as companywide financial reporting to a chief financial officer) often should be supported by a centralized data processing operation. At lower levels of an organization, however, decision making often relies on local information; centralizing the processing of such local information can slow the turnaround times of essential reports. The micro

CA/CICS.
FIVE WAYS TO GET CONTROL OF YOUR CICS NETWORK AND MAKE IT MORE USEFUL, MORE RELIABLE, MORE SECURE, AND MORE EFFICIENT.

CA-FLEXISCREEN
The industry's most efficient screen generation tool—fast, flexible, easy to use. Will greatly ease your programmers' work load.

CA-RAPS
Eliminates major system bottlenecks by allowing printing of power queue files at remote sites. Speeds report distribution as much as 10-fold.

CA-EZTEST/CICS
Automatic online testing and debugging facility that will save not just hours, but days. Menu-driven, self-teaching, and usable by even the most inexperienced programmers.

CA-JARS/CICS
Monitors CICS performance and provides complete job accounting. Pinpoints problems and lets you maintain maximum efficiency.

CA-SENTINEL
Provides both batch and online CICS protection in one product. Maintains data integrity. The proven effective way to achieve total data center security.

Get control of your CICS environment—call 800-645-3003 or (in NY) 516-333-6700 and ask for Dana Williams.

can be an effective tool for middle-level decision making, therefore, because it focuses processing capacity where it is required. The result is almost immediate availability of information.

There are other organizational advantages to decentralizing data processing capacity besides providing timely reports to local managers. For one, decentralization can sometimes enhance security of data maintained on a central computer. Suppose a small staff group is responsible for preparing a biweekly report to an executive committee and that this group relies on operating data read from tape on a central computer. A production manager in the same organization uses this operating data to make critical production decisions. There is always the possibility that the first group will inadvertently destroy or lose the operating data in manipulating it for the report. A system could be designed, however, to transfer the necessary operating data from the central computer to a micro and allow the staff group to make the manipulations it desires in preparing its report.

2b. Does the application support information needs that are highly localized?

This question should also filter out projects that support centralized information needs, as the previous question does. However, the question admits projects that are localized rather than distributed. Localized in this sense means projects that support information needs at only one location. For example, the marketing director of a small subsidiary company may manage his sales force in a way completely different from the managers of all other subsidiaries. His needs are local.

The example in the previous section also described a localized information processing need. Applications that are distributed represent identical information processing needs repeated at various points throughout an organization, usually at middle levels. It is quite possible, therefore, for a distributed application to be localized, although a localized application will not be distributed.

3. Is the application both unique and important?

This is a question of the marginal economics of a custom-developed vs. a packaged software approach to a problem. If the application is appropriate for a micro (as determined by the previous tests), then the next step is to determine if the benefits of a custom system will outweigh the costs.

One approach to this problem takes a qualitative perspective. It begins by mapping the project on a three-by-three matrix, which plots uniqueness vs. importance (see diagram on ID/17). In order to justify a custom development effort, the proposed project should be unique (in which case there will be no packaged software available for the application), very important to the organization (in which case the software must meet performance standards that exceed those of most packages) or both. In terms of the matrix, the project must fall in one of the three boxes on the upper right-hand corner in order to justify custom development.

If the application is appropriate for a micro (as determined by testing), then the next step is to determine if the benefits of a custom system will outweigh the costs.

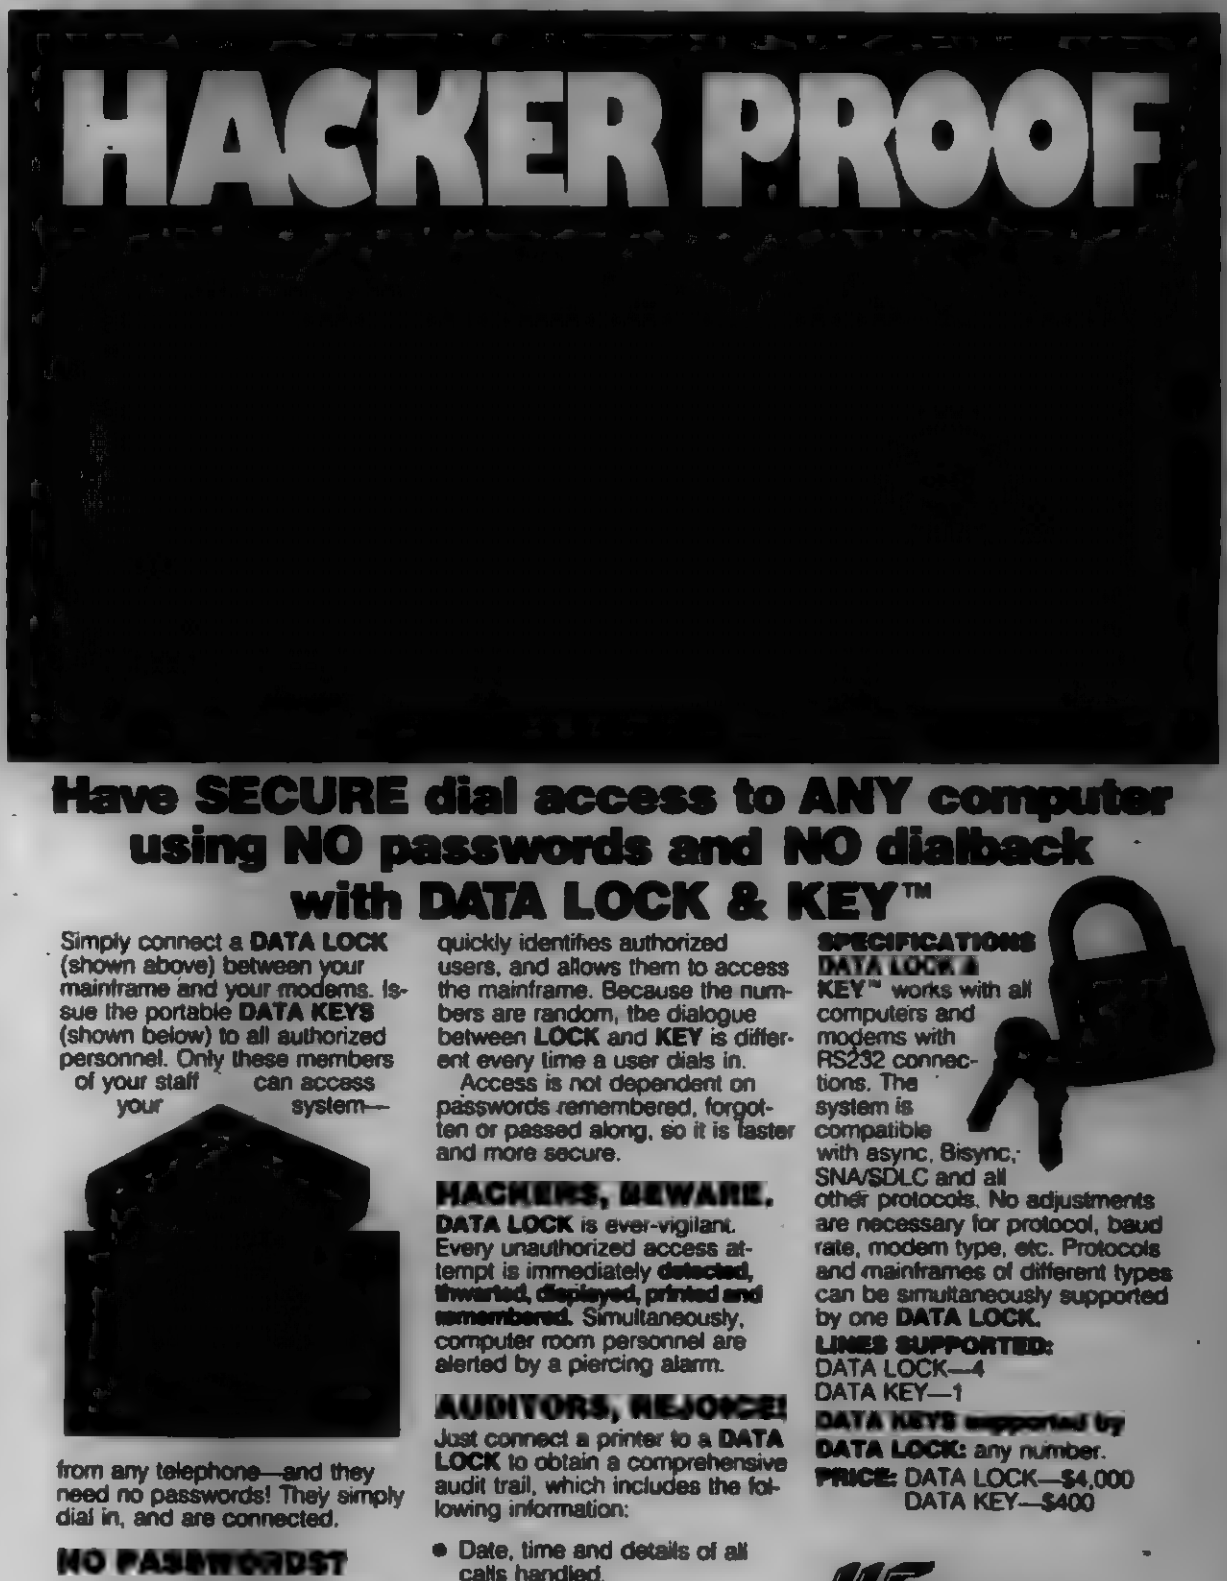
In mapping the proposed project on this matrix, determining application uniqueness is simpler than determining importance. One might begin by determining the availability of packaged software to meet the needs of the application. This implies, naturally, that the requirements of the system are already well understood. In any case, it is generally true that the more unusual a given application, the less likely a packaged software product will be available for it. In making this determination of uniqueness, therefore, one might ask:

- Can functionality be added easily to a packaged product to meet changing user needs?
- Is the package compatible with other systems now in use in terms of data, input and output requirements?
- Can the package handle the size of data base required by this application?
- Does the package provide an appropriate user interface?
- Does the package have the processing speed necessary for this application?
- Will support be available for implementation and use?

If a package meets these or other appropriate criteria, it can be considered an alternative to custom development. Otherwise, the application may be viewed as unique. Compatibility is significant enough that it is treated as a separate test below.

Judging the relative importance of an application is a more difficult task. The extreme cases are often self-evident. For example, a claims processing system is critical to an insurance office, since no work can be accomplished without it. But the marginal cases are more difficult.

One approach relates the relative importance of a proposed system against systems already in operation. One might prepare a list of



Have SECURE dial access to ANY computer using NO passwords and NO dialback with DATA LOCK & KEY™

Simply connect a **DATA LOCK** (shown above) between your mainframe and your modems. Issue the portable **DATA KEYS** (shown below) to all authorized personnel. Only these members of your staff can access your system—from any telephone—and they need no passwords! They simply dial in, and are connected.

NO PASSWORDS!
Only a **DATA KEY** can provide correct responses to the large random numbers sent by the **DATA LOCK.** Thus the LOCK quickly identifies authorized users, and allows them to access the mainframe. Because the numbers are random, the dialogue between **LOCK** and **KEY** is different every time a user dials in.

Access is not dependent on passwords remembered, forgotten or passed along, so it is faster and more secure.

HACKERS, BEWARE.
DATA LOCK is ever-vigilant. Every unauthorized access attempt is immediately **detected, thwarted, displayed, printed and remembered.** Simultaneously, computer room personnel are alerted by a piercing alarm.

AUDITORS, REJOICE!
Just connect a printer to a **DATA LOCK** to obtain a comprehensive audit trail, which includes the following information:

- Date, time and details of all calls handled.
- Statistics of line usage.
- Unauthorized **DATA KEYS** (i.e. lost or stolen **KEYS**).

SPECIFICATIONS
DATA LOCK & KEY™ works with all computers and modems with RS232 connections. The system is compatible with async, Bisync, SNA/SDLC and all other protocols. No adjustments are necessary for protocol, baud rate, modem type, etc. Protocols and mainframes of different types can be simultaneously supported by one **DATA LOCK.**

LINES SUPPORTED:
DATA LOCK—4
DATA KEY—1

DATA KEYS supported by DATA LOCK: any number.

With Exxon you never have to face it alone.

"Hmm...Exxon support people make sure I get what I need, when I need it."

We think the way your office automation equipment works out is just as important as the way it *works*. So at Exxon Office Systems we support you — in every step of your office automation program.

First, before we'll sell you any equipment, we perform a free needs analysis. Once you've made a commitment, we don't just deliver boxes to your door. We install your equipment for you, and then we train your staff to use it.

If you or they have any questions we have toll-free on-line support/service that works with you on similar equipment. And that support includes the immediate dispatch of service, if it's ever needed.

You see, at Exxon we're committed to office automation support that's so complete, it will face up to all your needs.

For additional information call 800-367-8888, or write Exxon Office Systems, P.O. Box 10184, Stamford, CT 06904-2184.

EXXON OFFICE SYSTEMS

The future...without the shock.

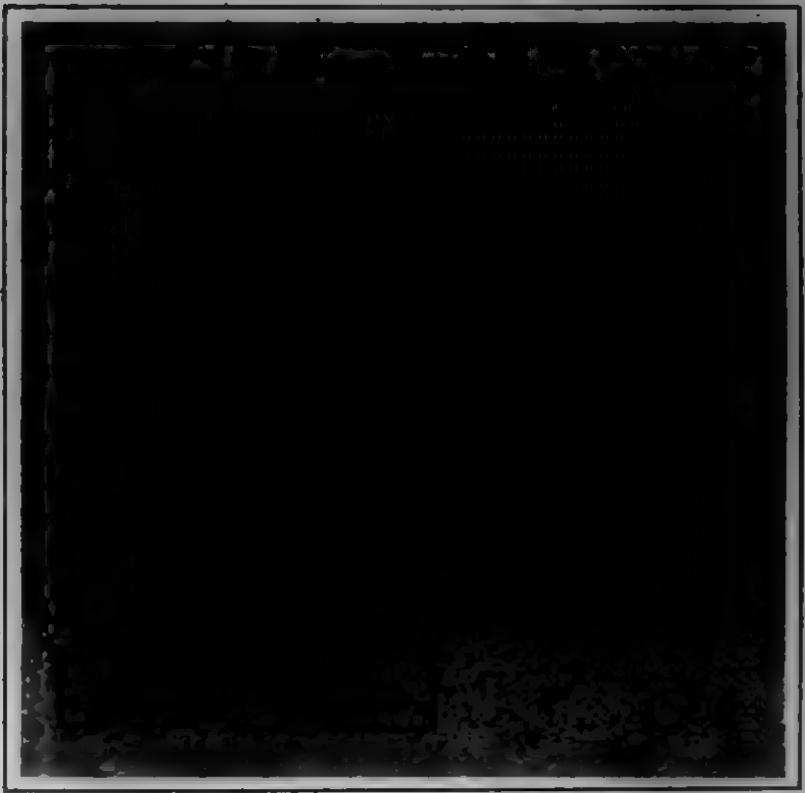

Figure 2. A micro-based order costing system

applications in use, ranging from customer billing to a spreadsheet package used by a manager to prepare budgets. Note that these systems need not all reside on a microcomputer, nor do they have to be computerized. It is only necessary that a reasonable range of discrete operations be compiled. The proposed project can then be ranked against operations in existence in order to determine how critical it actually is to the organization.

There are subtle ways in which the judgment of a system as relatively unique and important can interact. For example, the degree to which a project is highly distributed throughout an organization can affect its "importance." An application that would be used in all the marketing offices of an industrial equipment manufacturer would be more important to that firm than one that would appear in only one office. The application that is widely distributed would yield higher benefits in total productivity gains than an application that is extremely localized. Hence, all the issues of distribution, localization, uniqueness and importance must be considered within the analysis of the problem. That interaction should come out in this stage of the analysis.

4. Must the system be compatible with other systems in use?

This last criterion may be the one that most often justifies custom development efforts. Even if the proposed system is not unique and does not rate high in terms of importance to the organization, the requirement that it be compatible with other systems in that firm is often enough reason for custom development. "Compatible" means that the system uses data in the same format as the systems used by the organization as a whole, that it produces reports that appear in the same format as those of the organization, that it is able to communicate directly with the centralized data processing system of the organization and/or that the language in which it is constructed is the same as, and meets the standards of, the organization as a whole.

An example illustrates the notion that a micro-based application should serve needs that are localized and distributed throughout an organization. A manufacturer of industrial process control equipment marketed its products through a large number of local sales offices. These offices were staffed by sales engineers who worked closely with customers in helping them choose the proper equipment configuration for their needs.

Because the company produced thousands of individual items that could be combined in many ways, the process of preparing orders for the customer was time-consuming. It involved looking up all the items required by the customer, checking their compatibility and availability, finding their price and filling out a complicated worksheet.

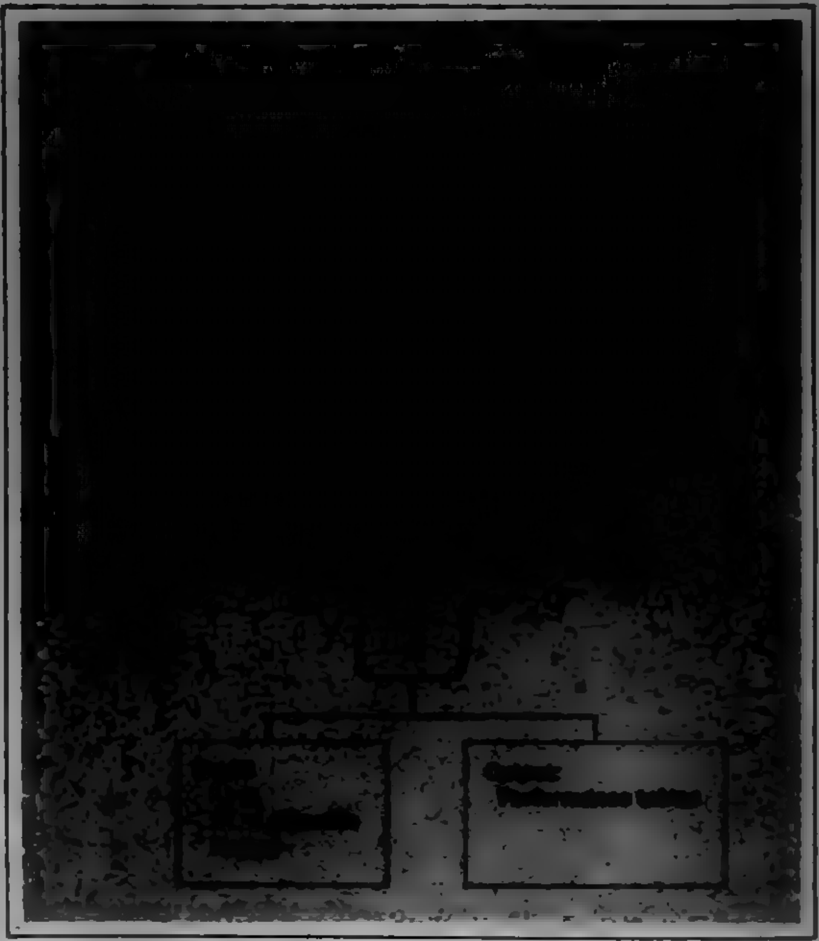

Figure 3. A micro-based mutual fund reporting system

The firm addressed this problem by developing a micro-based system that could retrieve price and availability information from the mainframe and prepare an order costing sheet (see Figure 2). The system was used in each of the sales offices of the firm by the sales representatives. They could prepare a proposal for a customer based on the most recent price and availability information on the central system.

This arrangement decreased the time necessary to prepare proposals and allowed the sales staff to be much more responsive to customer needs.

The project met several of the criteria discussed in section two. The need for the application existed in each of the local sales offices of the company, making it distributed. The application was also quite specific to the parts list and pricing scheme of the firm. In fact, an early prototype developed using Ashton-Tate's Dbase-II turned out to be unbearably slow.

Finally, because of its wide distribution throughout the marketing organization of the company, the project was easily justified by the increase in productivity in each sales office. The system did not represent

DJC
Recommends Digital Terminals

For Video Display And Printers There's No Name Like Digital

The VT™ 200 family sets a new standard in video terminals. Included are the VT 220 a conversational text only terminal; the VT 240, for text and interactive monochromatic business graphics; and the VT 241, featuring full color graphics. All are compatible with the popular VT 100 series.

Digital's family of printers can fill all your needs. The Letter Print 100 (LA™ 100) gives you three printers in one—draft quality, letter quality and graphics. The LA 50 Personal Printer adds efficient, low cost printing to any personal computer. These new Digital printers feature the same quality and reliability that made the LA 120 the top rated heavy duty Matrix printer in its class.

DJC stocks Digital, both videos and printers—so call DJC, the leader in peripheral distribution, and ask for Digital.

a critical function for the firm in any sense. Orders were, and probably still are, prepared by hand. But the system had the potential for greatly reducing the time necessary for preparing proposals and orders for customers. The system also would standardize the ordering process and provide information to the manufacturing operation about sales much more quickly. Thus, the cumulative benefits of the system justified custom systems development.

The second case illustrates the opposite situation. An investment advisory firm tracked the performance of about 600 mutual funds and published its data in a newsletter. The data used in this activity included several measures calculated from current security price data. A small staff group carried out the calculations necessary in compiling these tables, using, in part, security price data read from pricing tapes. Another group within the firm also used these pricing tapes in managing clients' investment portfolios.

The firm felt that the job of compiling performance statistics should be automated. This would allow the staff greater freedom to pursue special analysis of the raw performance data. However, rather than develop the system for the minicomputer that read the pricing tapes and that the firm's portfolio managers used in their jobs, the company chose to build the mutual fund tracking system for a microcomputer (see Figure 3 on ID/23).

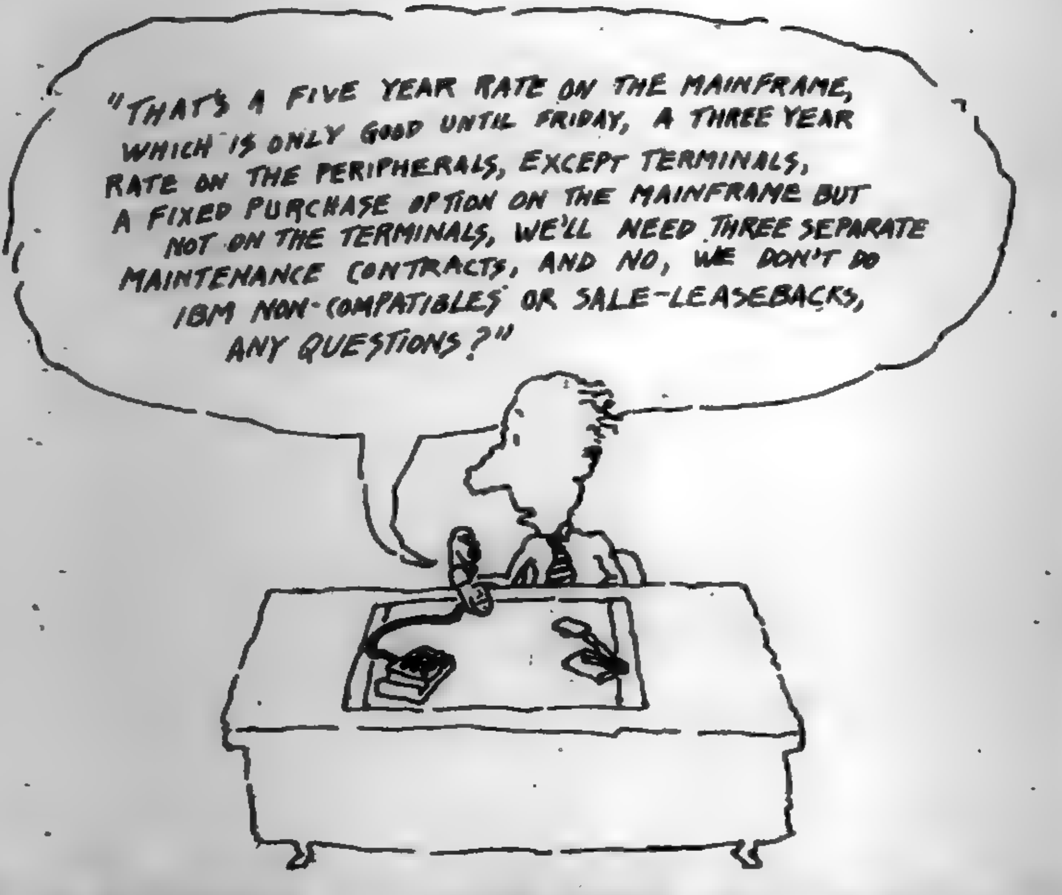
Both the system developed and the hardware would be totally dedicated to the task of compiling biweekly performance data. The system would download the necessary price information from the minicomputer to the micro, read other information from manual data entry, compile reports and allow the staff group to perform limited analysis of the basic information.

One firm, rather than add another function to its minicomputer, chose to build a custom mutual fund tracking system for a microcomputer. The system would be totally dedicated to the task of compiling biweekly performance data.

This system illustrates the virtue of placing a critical business function on a dedicated piece of hardware. The biweekly reports represented one of the most fundamental products sold by the company. This value in itself justifies a custom development effort. However, further justification was provided by the competition for pricing information between portfolio managers and the mutual funds tracking group. The importance of each of these activities argued strongly for separating their functions as much as possible.

Finally, since the work of the mutual funds group included some analysis of performance figures, the system had to allow for possible future enhancements. Even though the need for the application was extremely local, the critical nature of the application, the need for compatibility with other systems and the need for a modular design all required custom development.

In a final example, a large commercial bank recently decided to enter the municipal bond registration and transfer agent business. It already offered government banking services to municipalities, specifically by providing advice on the preparation and marketing of a new bond issue. In making the decision to enter the registration business, the bank also recognized a need for a high-quality system to support the service. Yet, while the bank realized that the volume of registrations it would handle was small and that a microcomputer could handle the required data base, it was unable to



"THAT'S A FIVE YEAR RATE ON THE MAINFRAME, WHICH IS ONLY GOOD UNTIL FRIDAY, A THREE YEAR RATE ON THE PERIPHERALS, EXCEPT TERMINALS, A FIXED PURCHASE OPTION ON THE MAINFRAME BUT NOT ON THE TERMINALS, WE'LL NEED THREE SEPARATE MAINTENANCE CONTRACTS, AND NO, WE DON'T DO IBM NON-COMPATIBLES OR SALE-LEASEBACKS, ANY QUESTIONS?"

IF YOU NEED A COMPUTER TO SORT OUT YOUR LEASING ALTERNATIVES,

WE HAVE A BETTER IDEA.

Phoenix Leasing now offers one stop lease shopping for IBM, IBM compatible, and IBM non-compatible computer systems and peripherals.

Configure your own system, and select your own lease plan, with terms ranging from 1-5 years for IBM and IBM compatible equipment and 3-5 years for IBM non-compatible equipment.

If our standard lease plans don't fit you, let us custom design one that does.

Contact Phoenix Leasing today. You'll find you don't need a computer to appreciate our flexible lease terms. We have a better idea for you.

locate a suitable software package.

The bank met this need by specifying and building a microcomputer-based system to manage the process of registering municipal bonds and transferring the ownership of certificates. The system was built using such standard development tools as the C programming language, a commercially available data base management package and AT&T Bell Laboratories' Unix operating system. Unlike the previous examples, this system operated in isolation from other systems at the bank. It received all input through data entry operators in the bond registration area of the bank and produced all output locally, including all regular interest and principal payment checks.

This project met several of the requirements mentioned in the previous section. First, the application was critically important to the business of providing registration and transfer agent functions. In an important sense, the system that managed registrations and transfers was the business. The bank had a strong motivation, therefore, to seek out the most effective system it could find for this application.

Second, the application was unique in that no packages were available for mini and mainframe computers, but these were too large for the scope of the business the bank had in mind.

Finally, the operation was extremely localized. It was run by fewer than 10 professional and clerical staff. Information fed into the system from only one location in the bank, and processing took place in only one location.

All these examples demonstrate that there are many situations in which organizations should pursue a custom development strategy for microcomputer-based systems. Demands for such systems exist in most industries, in all functional areas and at most levels of organizations.

There are many situations in which organisations should pursue a custom development strategy for micro-based systems. Demand for these systems exists in most industries, in all functional areas and at most organisational levels.

These systems are typically organizational and localized.

End users and MIS management must recognize that many information management problems have these characteristics and that microcomputers can accomplish a great deal more than run word processing and spreadsheet application software. Of course, many firms are coming to this realization, particularly now that hardware such as the IBM Personal Computer AT is available to support truly multiuser, multitasking systems.

Indeed, the potential of micro-based, multiuser systems suggests that we may see a reverse of the trend found in mainframe environments, which has been from custom to packaged software.

About the authors

John Saunders is a principal with the Boston Systems Group. He recently managed the development of a decentralized management system for a division of a large university.

Naomi Karten is president of Karten Associates in Randolph, Mass., and an associate of the Boston Systems Group. She consults to businesses and vendors on implementing and managing end-user computing.

No other IBM™ compatible has more value to offer than we do– more hardware, more free software and more dealers coast to coast to serve you better.

While most computer companies are treading lightly today, Columbia's taking giant steps into '85. We've added a 10 MB hard disk portable at $3,495, that gives you three portable choices. We've got four desktops to choose from and for the demanding executive, we've recently introduced two fixed drive professionals with internal tape back-up. At Columbia things never looked better.

Look at Compatibility. Columbia's superior compatibility extends across the boards and across the spectrum of thousands of available software packages.

Look at Expandability. We offer more expansion slots and built-in ports. Our expansion slots give flexibility to add memory, data communications, multi functions and networking with IBM compatible PC boards. With our built-in ports you can add peripherals like modems, printers and plotters. We allow you to keep expanding as your needs expand.

Look at Performance. Our new 30M byte hard disk model with its 40 millisecond access time gives you performance where it counts, and we back it up with an internal tape system as well. Our new portable also features a hard disk giving it, too, peak performance.

The entire Columbia family of nine computers is field-proven with the most popular local area networking and data communication products on the market today, i.e., 3-COM ETHER SERIES,™ CORVUS OMNINET,™ IRMA,™ NOVELL NETWARE™/OS and NESTAR.™

Look at what you get if you buy by December 15th. Buy one of our dual drive Columbia computers by December 15th and you'll get with it a $2,500 software library which includes MS DOS 2.1, BASICA 2.0, word processing, spelling checker, filer, spreadsheet, database manager, home accounting, communications, colographics, diagnostics and four ATI tutorials.

Plus when you buy any Columbia with at least 256K and two disk drives, you'll get free, OPEN ACCESS™ integrated software. OPEN ACCESS from SPI is a leading integrated software package that retails for $595.00. But for you it's absolutely free. You'll get information management, communications, spreadsheets, word processing, 3-D graphics and time management. This offer is available only at participating, authorized Columbia dealers.

Contact the nearest Columbia dealer in your area while he has Columbias in stock. With what we're giving away, he won't have it long.

Good things come in small packages.

The possibilities are endless with **Northern Telecom's Displayphone-Plus™** — the **business telephone and computer terminal all in one.** If you need immediate access to records, schedules, data, and reminders, the Displayphone-Plus provides information from your own office computer as well as from hundreds of outside data bases.

Housing display, telephone, keyboard, and modem, the compact desktop unit offers fast installation by plugging directly into existing telephone jacks. Within minutes you have simultaneous voice and data at your fingertips.

Features Include:

Built-in 1200-baud modem. DEC VT100 plug compatibility. Selectable IBM or ANSI protocols. Centronics-compatible parallel port. Up to 32 user-defined functions. Dual voice lines with optional ring. Automatic answer and log-on for directory transmission plus manual mode for password security. Storage of up to 90 names and numbers for automatic dialing. Full-stroke retractable alphanumeric keyboard. Easy-to-read amber screen.

These combined features make the Displayphone-Plus the solution to your business and time management problems — both now and in the future.

Displayphone-Plus is a trademark of Northern Telecom Limited.

WE ALSO OFFER:

1. A full line of data communications and peripherals equipment!
2. Business and developmental software — plus a wide selection of data processing supplies!
3. Rental, leasing, and purchase plans for every need!

IN DEPTH

TO PATENT OR NOT

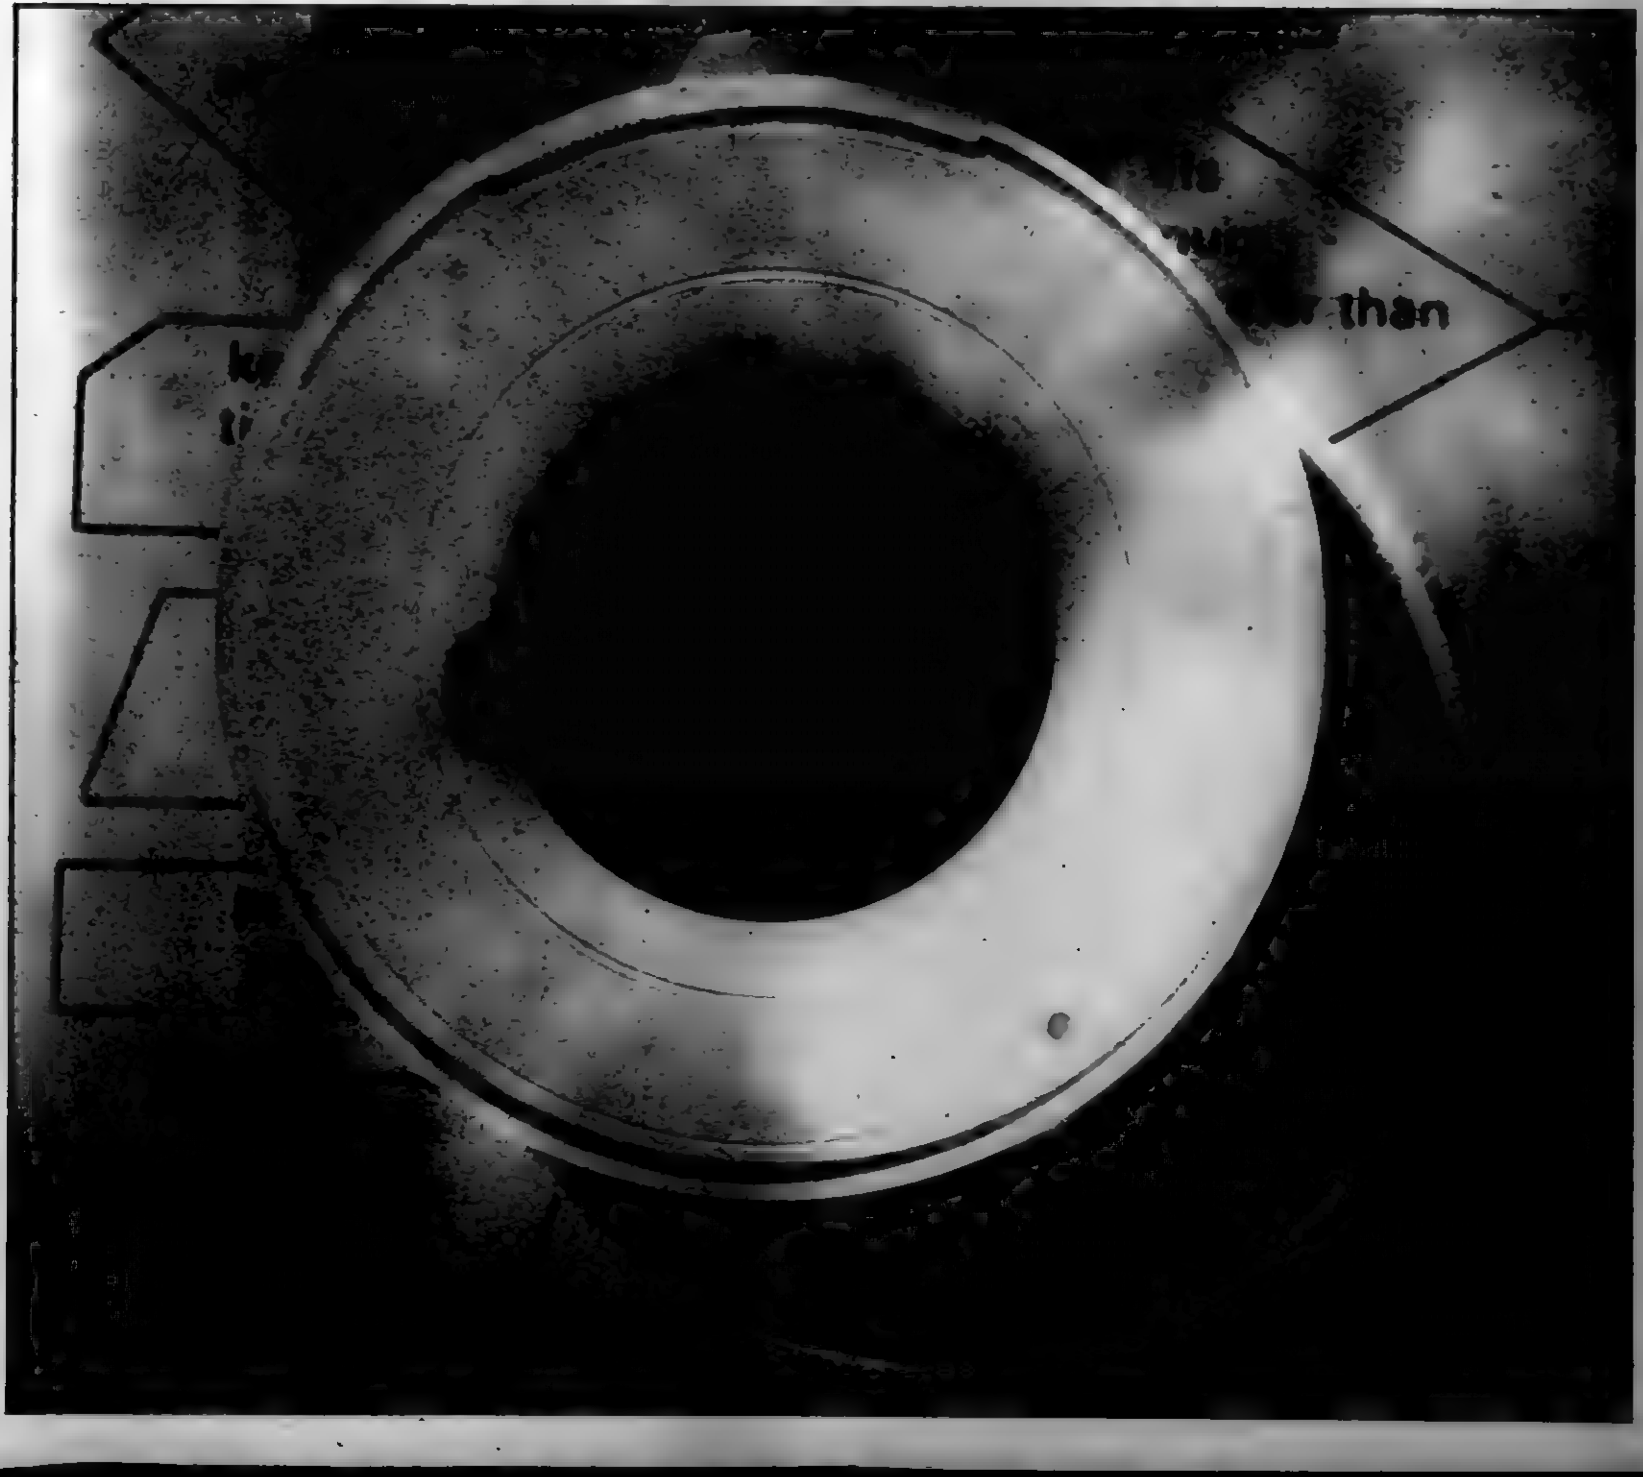
Trends in software protection

By Stephen Becker

Software patents are not for everyone. They protect only certain types of software and must pass a stringent examination process at the U.S. Patent and Trademark Office. They are expensive because in virtually all cases a patent attorney must be hired to do the work. In addition, the period of time required before the patent is granted is substantial. The process can take up to two years or more, and a patent has no teeth before it is granted. But once the patent is granted, it is formidable.

Unlike a copyright that covers only expression, a patent protects the concept behind your software. Whereas you must prove actual copying of your software by another person to show copyright infringement, patent infringement does not require copying; it covers competitive software that is independently developed after yours.

A trade secret must be a secret. Once your software becomes known to the public (and this can be done by a competitor who may reverse engineer your software), trade secret law is lost. Software protected by a patent, however, does not have to be maintained secret. Legal protection extends even to different but equivalent software that may have been written independently or by reverse engineering yours.



The New Cincom: 10
the only software ve

Finally, there's one software vendor offering a sophisticated software information network capable of meeting all of your corporate, departmental and personal information software needs—The New Cincom Systems. Organizations around the world are discovering that working with Cincom's integrated family of products enables them to greatly improve both performance and productivity. Here are just 10 of the many reasons why you should be considering the New Cincom software information network for your company:

#1 Relational Data Management Technology

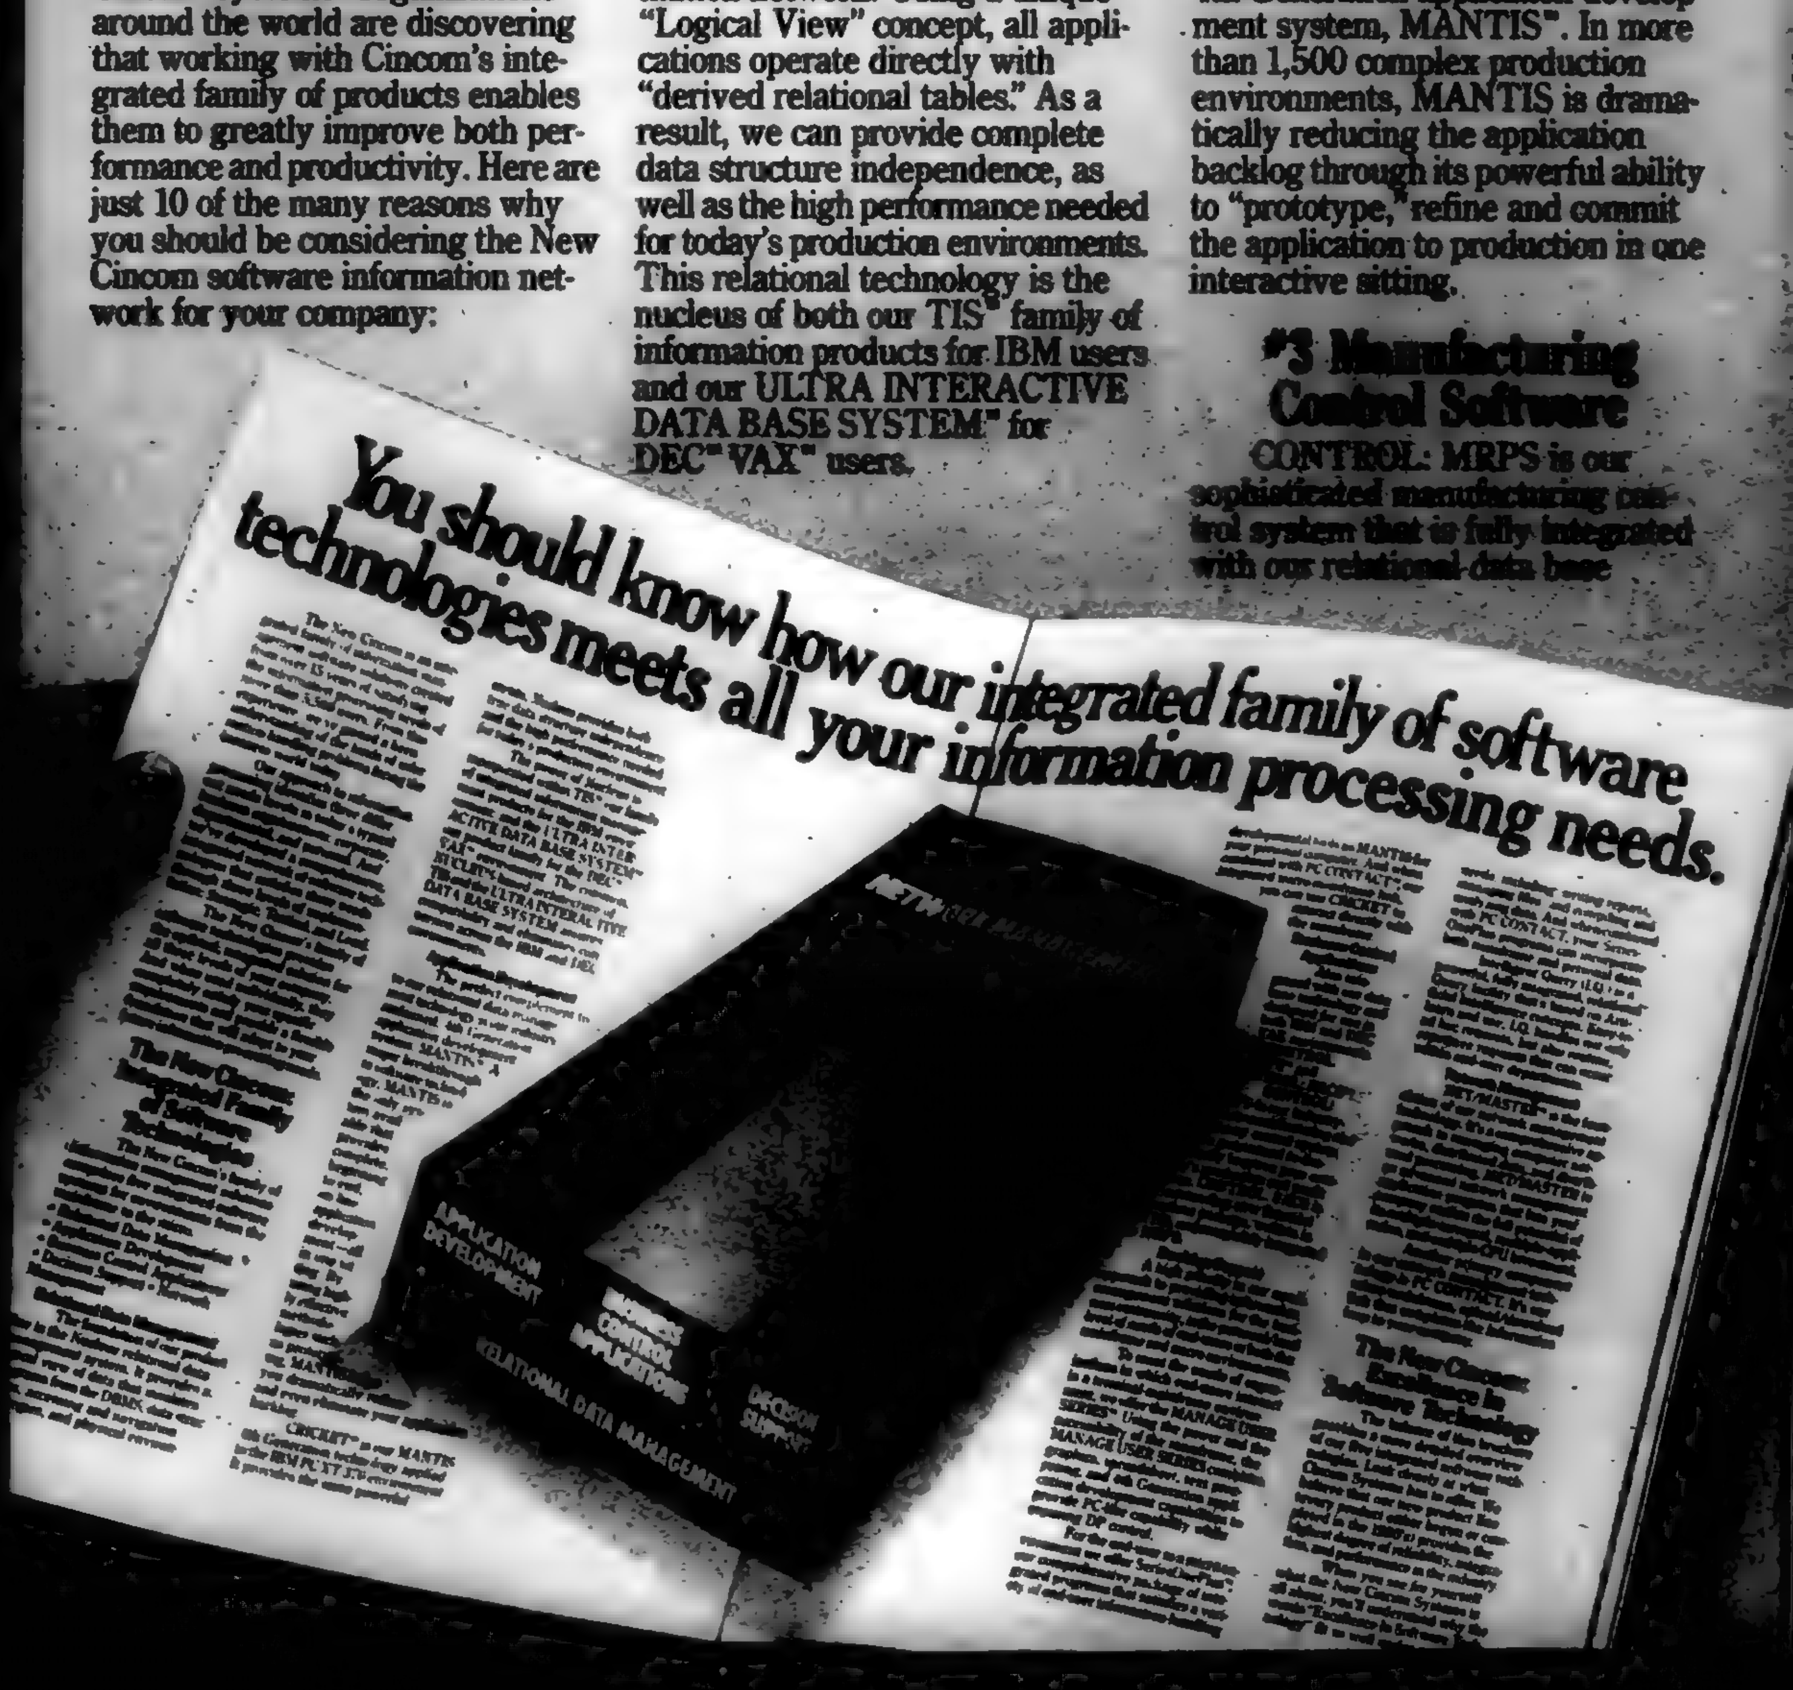
Powerful relational data management technology forms the "nucleus" of our software information network. Using a unique "Logical View" concept, all applications operate directly with "derived relational tables." As a result, we can provide complete data structure independence, as well as the high performance needed for today's production environments. This relational technology is the nucleus of both our TIS™ family of information products for IBM users and our ULTRA INTERACTIVE DATA BASE SYSTEM™ for DEC™ VAX™ users.

#2 Fourth Generation Application Development

The perfect complement to our relational data management technology is our industry acclaimed 4th Generation application development system, MANTIS™. In more than 1,500 complex production environments, MANTIS is dramatically reducing the application backlog through its powerful ability to "prototype," refine and commit the application to production in one interactive sitting.

#3 Manufacturing Control Software

CONTROL: MRPS is our sophisticated manufacturing control system that is fully integrated with our relational data base



You should know how our integrated family of software technologies meets all your information processing needs.

reasons why we're
ndor you'll ever need.

technology. A complete closed-loop system, MRPS is improving the productivity and profitability of over 125 IBM and DEC VAX manufacturing environments around the world.

#4 Financial Control Software

CONTROL: Financial is our sophisticated financial accounting and control system which molds to the way you do business. Integrated directly with MRPS, CONTROL: Financial includes Accounts Receivable and Credit Management systems with Accounts Payable soon to follow.

#5 Advanced Network Management

NET/MASTER™ is one of the most recent additions to the New Cincom family of integrated products. Very simply, NET/MASTER is an advanced network management system that takes the complexity out of managing a sophisticated IBM computer network and lays the groundwork for distributed data base processing.

#6 The Interactive Mainframe—Micro Link

Further expanding the capabilities of our software information network is PC CONTACT, our mainframe-micro link which enables users to interactively upload/download data between the mainframe and IBM PC's. PC CONTACT gives the PC user the ability to access multiple file types stored in the corporate data base for Decision Support manipulation.

#7 Micro Decision Support Software

For comprehensive micro-level Decision Support we offer SeriesOnePlus™*. SeriesOnePlus includes file management, spreadsheet, graphics, reporting and word processing components that are all integrated through a unique "BUS" architecture. Because the system is designed exclusively for business situations, SeriesOnePlus complements any mainframe-micro-network strategy.

#8 Mainframe Decision Support Software

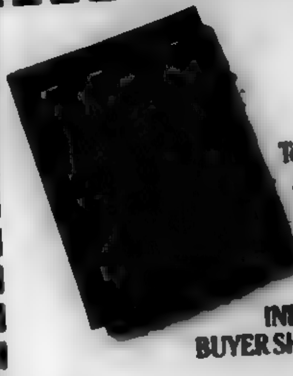
The recently introduced MANAGE USER SERIES™ provides powerful Decision Support capabilities for the mainframe user. The MANAGE USER SERIES combines graphics, spreadsheet, text processing and application development tools to enhance the use and display of corporate data.

#9 Client Support

The one thing that isn't new about Cincom is our unrivaled commitment to service, support and user education. When you choose Cincom you can be assured of the highest caliber of support.

#10 Software Excellence

Why the New Cincom? Well, we like to think of ourselves as the New Cincom because every product in our software information network has been released since [illegible]. And quite frankly, we believe our new products provide the highest degree of reliability, integration, performance and value in the industry. As proof, just look at our sales. From 1982 to 1983, TIS sales rose 136%, MANTIS sales rose 50%, and MRPS sales rose by 45%. For even more proof we invite you to personally compare our products with what our competitors are offering. Then you'll understand why the words "Excellence In Software Technology" fit so well under our name.



To Learn Even More About Cincom Call Or Write For Our Brochure: "THE NEW CINCOM: WHAT EVERY INFORMED SOFTWARE BUYER SHOULD KNOW."

Cincom Systems®

Excellence in software technology.

CW 11/26

A patent is a right granted by the government to an inventor to exclude others from making, using or selling the patented invention in the U.S. for a 17-year period. Thereafter, the public owns the invention. In exchange, the inventor must make a complete disclosure of the invention in a patent application that is published after the patent is granted.

During the period of time when the patent application is being examined at the U.S. Patent and Trademark Office, the invention is maintained in secrecy; there is absolutely no way for the public to gain access to the information in your patent application before it is granted.

Suitable disclosure

Probably the best type of disclosure on computer software is a complete flowchart together with commentary describing the type of computer hardware used with software, the nature of the input signals to which the software responds and the types of output signals generated. A patent attorney will prepare all the necessary documentation for the patent application, but you will have to spend quite a bit of time with your attorney developing a suitable patent disclosure.

Patent attorneys must be registered with the Patent and Trademark Office. You can obtain the names of patent attorneys in your area by writing the U.S. Patent and Trademark Office, Washington, D.C. 20231. Be sure to select an attorney who has had experience with software-related cases.

A patent covers only subject matter that is new and is not obvious from what has been done before. Your patent attorney will have a search made at the Patent and Trademark Office to determine whether your software invention appears to be patentable before a patent application is prepared. You must work closely with your attorney to prepare the patent application because you will probably be more familiar with the technology.

After the application is filed at the Patent and Trademark Office, a patent examiner who specializes in software-related inventions makes a search of his records to determine whether your invention is patentable. You will, in a sense, also be working with the patent examiner, showing him the closest software to yours of which you are aware, reviewing what the examiner locates during his search and, with the help of your attorney, negotiating the scope of your patent.

Patents on software

In the past, there has been quite a bit of controversy over whether software or systems involving software are patentable. The problem is that certain types of subject matter resembling software have been determined by the courts to be incapable of being patented. For example, it is not possible to patent a mathematical algorithm or equation, such as the Pythagorean theorem, although it is possible to obtain a patent on a process or machine that in some way applies that theorem.

It is also not possible to patent a mental process, a method of doing business or a scientific principle. Early court cases were pro-software, finding ways whenever possible to justify patenting computer-related inventions.

Then, in 1972, the U.S. Supreme Court issued an adverse decision in a case involving a program for numerical conversion on the grounds that an invention involving a mathematical algorithm that has no practical application except in connection with a digital computer is not patentable because patents of this type would effectively preempt use of pure mathematics.

There was a concern in the legal community that computer programs, which

Reactive or resourceful?

Action rather than reaction marks the resourceful and successful manager. As an MIS/DP specialist, you can anticipate the needs of your colleagues and act in your company's best interests by introducing Dow Jones News/Retrieval® into your corporation.

Dow Jones News/Retrieval can be accessed with most standard time-sharing terminals, personal computers or word processors with communications capability. . .or even integrated into your office automation systems.

It's one way to be certain any manager and staff member, in any department, can have the reliable business and financial news, corporate analyses and economic forecasts needed to anticipate and respond quickly to opportunities for growth and profits.

Dow Jones News/Retrieval is a powerful, versatile, time-saving and, above all, extremely easy-to-use information resource that has application at every level of corporate activity. It will give your entire management team an immediately accessible selection of high-quality data bases they can use to solve problems, analyse trends and increase productivity.

Only Dow Jones News/Retrieval provides instant electronic access to *The Wall Street Journal*, *Barron's*, the Dow Jones News Service *and* Dow Jones Current and Historical Quotes that are continuously monitored for accuracy by our staff.

Dow Jones News/Retrieval can even accommodate departmental usage billing if you wish.

Users may also purchase Spreadsheet Link, the Dow Jones Software package that allows you to download data from Dow Jones News/Retrieval into three of the leading spreadsheets: Visicalc®, Lotus™ 1-2-3™ and Multiplan®.

For every action there's a reaction. Call Dow Jones News/Retrieval right now and watch your colleagues applaud a very smart decision.

For full details, call Eric Bradshaw, National Sales Manager, during office hours at (609) 452-2000, Ext. 2678.

IN DEPTH/SOFTWARE PATENTS

Dean Witter Reynolds attacked the validity of the patent on the grounds that the patent is a method of doing business that traditionally is unpatentable subject matter.

by their nature involve algorithms, are not patentable and that processes and machines involving programs are also not patentable. For a time, some attorneys were actually converting software into hard-wired circuits in patent disclosures to avoid rejections by the patent examiner. It became unclear whether at one extreme all inventions involving software of any type were unpatentable or, at the opposite extreme, only mathematical algorithms were unpatentable. This situation created quite a bit of confusion that was resolved only recently.

In 1981, the Supreme Court heard a patent case involving a program used in a rubber curing system. The temperature at various points within a mold was measured and supplied to a programmed computer. The computer processed the temperature measurements using a mathematical equation to open the mold at the exact time for optimum curing. The Supreme Court held the invention to be patentable, reopening the door to software-related patents.

To determine what types of software inventions may be patentable, the court used a test adopted from a lower court. The patent claim must first be analysed to determine whether it recites a mathematical algorithm. If the claim does not recite (directly or indirectly) a mathematical algorithm, then the invention is patentable if it is new and not obvious over what has been done before. If the claim involves a mathematical algorithm, however, the invention nevertheless may be patentable if the claim does not completely preempt that algorithm. In other words, as in the rubber curing case, which involved measuring temperatures and opening a mold, there must be something in the software that goes beyond merely solving a mathematical algorithm.

The Patent and Trademark Office recently issued program patent examining guidelines endorsing the judicial test. Rather than dwelling on the types of software inventions that are not patentable, the guidelines instruct the examiners how to determine whether the software is new and unobvious and whether the patent disclosure is adequate.

Numerous patents have recently been issued on software inventions of various types. Last year, the District Court of Delaware reviewed a case between Merrill Lynch, Pierce, Fenner and Smith, Inc. and Dean Witter Reynolds, Inc. on a patent owned by Merrill Lynch covering its Cash Management Account program.

Dean Witter Reynolds attacked the validity of the patent on the grounds that the patent is a method of doing business that traditionally is unpatentable subject matter. However, the District Court of Delaware held the patent to be valid because the invention is a machine (programmed computer) and not a business method. The focus of the analysis must be on what the system is (a programmed computer), not on the use to which it is put.

In my opinion, the Merrill Lynch case goes too far. The categories of inventions, such as business methods, traditionally considered unpatentable, should not become patentable merely because they are practiced by a computer rather than by a human being. Nevertheless, the Merrill Lynch case has not, to my knowledge, been appealed, and the patent is being widely licensed.

Patents like the Merrill Lynch one are now being granted routinely by the Patent and Trademark Office. Unless there is a shift in the law, the

Uptime

Provide 24 hour CICS access
CICS Dynamic File Allocation is a must for effective CICS scheduling. It is the gateway to non-stop, round-the-clock CICS systems. It eliminates batch update constraints. It guarantees bullet proof restarts. It allows you and your batch jobs to add and remove CICS files at will, without disrupting your user community. Site license $3,000.

Browse CICS dumps on-line
The CICS Dump Display Facility provides immediate access to CICS dumps. CDDF is a no overhead "monitor" for production failures and test system abends. Selective dumps are completely formatted for CRTs and, the dumps can be printed immediately. Site license $3,000.

Finally, an on-line COM printer that isn't a pain in the mainframe.

All software for Bell & Howell COM systems is run on a built-in minicomputer. You won't have to interfere with your host computer's software.

If there's one thing you don't need, it's an on-line COM printer that makes you alter your host computer's software. Unfortunately, that's exactly what most systems make you do.

But not Bell & Howell. We found a way to eliminate the problem completely: Software control of our Series 6600 COM printers is through an intelligent preprocessor. You won't have to make even a single modification to your host software because the preprocessor's minicomputer takes care of everything.

It can handle microfiche production. Create and maintain job setups. And even produce audit trails. All at the same time.

About the only thing your operators need to do is enter a few simple English language commands on the keyboard. If problems occur, the 6600's software tells them what to do next.

Of course, software isn't the only thing that's convenient with Bell & Howell. Since our systems operate off-line, as well as on-line, they give you total flexibility for job scheduling.

What's more, both our 6600 archival processing system and 6650 dry system run up to twice as fast as other in-house COM printers. And since they both have totally self-contained processors, there's none of the mess you get with other types of systems.

For more information on the COM printer that's a pleasure instead of a pain, call our marketing manager toll-free at (800) 538-4000.

In California, call collect, (714) 660-1050.
In Canada, (416) 746-2200.

BELL & HOWELL
COM DIVISION

patents will be enforced in the courts.

In addition to the expense and length of time involved in obtaining a patent, the majority of software is not patentable despite liberalization of the law, because the software is not inventive enough. Most software, such as accounting programs, is just a rehash of functions previously done manually, only faster.

There is no guarantee that despite your attorney's best efforts, a patent will ever be issued. The examiner may simply refuse to grant the patent because he considers the software invention to be unpatentable.

Patent pending

Even if you appeal, you may lose. Although you can identify your program as having a "patent pending" while your patent application is before the examiner — and this may discourage some potential competitors — you have no real legal right until the patent is actually granted.

Patents are often criticized as being no more than "licenses to sue." An infringer might contest the validity of your patent in court, as Dean Witter Reynolds did in the Merrill Lynch case, and it is extremely expensive to defend a patent case. Statistically, as many as one-half of all patents that are challenged in court have been found unpatentable (patent opponents like to flaunt this), and appeal has been unreliable since the attitudes of various appellate courts have varied substantially.

On the other hand, fewer than 1% of all patents that are issued are ever litigated. It is only the weakest patents that are litigated; most cases involving the remaining patents are settled out of court. Although only about one-half the patents that are challenged in court survive, remember that in virtually any area of litigation half the parties win and half lose.

A practical problem with software patents is that they are difficult to examine properly. How do you determine whether software is new and unobvious? All software that is maintained as a trade secret and most software in the public domain is not in the files of the Patent and Trademark Office. Bearing in mind that the patent examiner has only several hours to do research, how does he locate and determine how prior software operates, particularly if no flowcharts are available?

This limitation is one reason that the Patent and Trademark Office previously opposed patentability of software inventions. During litigation, however, your opponent may have the resources to hire a small army of attorneys and experts to attempt to locate earlier software as evidence that your patent is invalid.

Brighter days

Despite various problems, software-related patents are becoming stronger and more widely used. Patent attorneys are becoming more proficient at drafting software patent applications, and the Patent and Trademark Office has hired a battery of new computer expert examiners. Although patents will never be perfect because all prior software, some protected by trade secrets, will never be before the examiners, new techniques for searching the software literature using data bases are being adopted by the Patent and Trademark Office.

Patent appeals have been consolidated into a single court, the Court of Appeals for the Federal Circuit, which tends to be more pro-patent than the Circuit Court that previously heard appeals. Patents are now more likely to be enforced, and a consistent body of laws will be established.

Because patents are expensive and will not be appropriate in every case, you should consider patent protection only for software that meets all of the following conditions:

- A commercial lifetime greater than about five years.
- Substantial commercial value.
- It involves more than the solution of a mathematical equation.
- It is clearly novel and unobvious — not a rehash of manual procedures, such as bookkeeping.
- It embodies a concept that is likely to be copied. ‡

Daunted by bouts with micros, terminals look for niche

By Tom Henkel
CW Staff

The days of the traditional CRT terminal — a unit with little or no intelligence used solely to communicate with a large computer system — appear to be dying. The popularity of desktop microcomputers and the availability of inexpensive off-the-shelf components have permanently altered the way many organizations view data processing. Consequently, there has been an increased user demand for local processing power plus the ability to access data stored in a host processor easily.

But while most industry watchers agree the traditional role of CRT terminals has been irreparably changed, there still is considerable disagreement over when the market for relatively unsophisticated terminals will breathe its last. Some analysts say the demand for microcomputers has already severely limited the use of CRT terminals. Others, however, maintain there is still a huge market for inexpensive CRT terminals, especially among clerical workers who do not really need local processing capabilities.

"People forget just how many terminals there are out there," noted Melody M. Johnson, an analyst with the Seattle brokerage firm of Cable, Howse & Ragen. Just the replacement market for popular terminals like Digital Equipment Corp. VT100 and IBM 3270-type units could generate enough business to keep the industry alive for several more years.

The price gap

Furthermore, Johnson noted, there is still a considerable rift between the price for an unsophisticated terminal and microcomputer systems. That gap is large enough to cause many companies to think twice about putting a micro on every desk.

Ilene Goldman, an analyst with International Data Corp. (IDC), a Framingham, Mass.-based market research firm, noted that an IBM 3270-type terminal can cost roughly half as much as a well-configured microcomputer. Goldman added that many companies, such as banks and insurance firms, use terminals mainly as a means to give workers access to data stored in a host mainframe.

For those users, there is little need for local processing capabilities, Goldman said, adding that few companies are willing to spend extra money to give employees capabilities they do not really need.

Johnson explained the trend toward desktop microcomputers has been very application-specific. For executives and secretaries who need to perform a variety of tasks, microcomputers have been a boon. But for clerical jobs, such as data entry, few companies have switched to using microcomputers over terminals. In fact, Johnson explained, many microcomputer companies don't know how to sell their products for so-called "back-office" applications.

The cost difference between terminals and microcomputers may be a temporary issue, noted Kenneth Bosomworth, president of Norwalk, Conn.-based International Resource Development, Inc. (IRD). Bosomworth said successful microcomputer makers are quickly building sufficient economies of scale into their manufacturing operations to negate the cost difference between terminals and microcomputers.

For example, even though a microcomputer tends to use more expensive components than standard terminals, Bosomworth explained that the microcomputer vendor capable of producing 100,000 processors a month may be able to sell the systems at a lower cost than a terminal manufacturer who makes 10,000 units a month. Currently, Bosomworth said some low-end microcomputers are already priced to compete favorably with terminals.

> *The popularity of desktop microcomputers and the availability of inexpensive off-the-shelf components have permanently altered the way many organizations view DP.*

But the disadvantage of bargain-basement micros is that they often do not allow users to switch between local processing and terminal modes easily. Some, Bosomworth explained, require users to load communications software onto the system before the unit can be used as a terminal. Bosomworth said users must be able to switch easily between terminal and local processing sessions for the system to be convenient.

He also said most microcomputer vendors could, and probably will, adapt their products to include the communications software in read-only memory. This would allow the user to choose either a terminal or local processing mode by flipping a switch.

One solution to the terminal/microcomputer issue is a hybrid product that offers both microcomputer capabilities as well as easy access to a mainframe in a terminal mode. IDC's Goldman noted IBM's 3270 Personal Computer offers such hybrid capabilities, but the unit is still more expensive than some 3270-type terminals.

Terminal makers are not taking the assault from the microcomputer community lightly. Most have taken advantage of off-the-shelf components to give their products some local intelligence.

"There are really no dumb terminals any more," Johnson said, adding that most terminal makers have discovered that producing an intelligent terminal does not typically cost any more than making a dumb terminal. Consequently, Johnson predicted the the already blurred distinction between terminals and microcomputers will become further confused with low-end microcomputers offering the same basic capabilities as high-end terminals.

Special Report to cover communications nets

Are you lost in a forest of local-area or long-haul networks? Let *Computerworld*'s February Special Report on communications networks update you on network architectures, communications software, independent software and satellite communications.

The Special Report will focus on corporate networking choices, including the feasibility of satellite bypass and private-line networks.

In addition, the report will cover the architectural applications and problems of digital private branch exchanges.

Contributions to the Special Report should take one of two forms: tutorial articles discussing issues or applications stories outlining a particular user firm's experience.

Articles may range in length from four to six typed, double-spaced pages. Artwork, such as charts, graphs and photographs, is also welcome.

Authors should include a brief biography and a telephone number at which they can be reached. The submission deadline for the February Special Report is Dec. 28.

If you have any questions, send them to Janet Fiderio, Special Reports Editor, *Computerworld*, Box 880, 375 Cochituate Road, Framingham 01701.

Terminals holding their own against micros

Maintaining position in large data-entry, editing environments

By [illegible] Goldman
Special to CW

A great deal of discussion has arisen among users and vendors alike concerning the possible impact of personal computers on the terminal market. Initially, most analysts predicted that the influx of the personal computer would trigger the decline of the terminal market. Embodied in this prediction was the notion that a terminal user would come out ahead by making the swap for the new device providing access to both worlds — terminal emulation and local processing.

After the novelty of the personal computer wore off, evidence of a different sort became apparent. For large, semidedicated data-entry and local editing environments, the terminal was, and is, by far the most cost-effective tool. This is not to imply that personal computers will not capture any of the high-end terminal market. They will, and have, but not to the degree analysts or vendors expected.

The key to the migration of terminals to the microcomputer is largely a function of vertical market applications. Purchasing schemes for terminals and micros in the banking, insurance, medical, utilities or retail world are often dissimiliar in nature. While one industry may be heavily host-application-dependent, another may have a mixture of host application and local processing needs. In environments where local processing outweighs, or is at least equal to, the amount of host-related applications, the microcomputer is a viable alternative.

More users when costs drop

If a terminal is used solely to interact with the host, replacing the terminal with a personal computer is unjustified. When personal computer costs drop to the point where they can compete head-to-head with the high-end terminal market, then more users, not just top executives, will opt to purchase personal computers. This will hold true for a diversified cross-section of industries. But until this time comes, the terminal will remain a viable and needed instrument.

In 1983, International Data Corp., a research firm in Framingham, Mass., determined that 1.78 million CRT-based terminals were shipped in the U.S. marketplace, as compared with 1.5 million in 1982. Overall, the U.S. terminal market experienced an 18% growth in shipments. These numbers, however, do not tell the whole story. To understand the future of the terminal market, a more comprehensive explanation must be made.

The terminal market is made up of asynchronous and synchronous terminals. On the asynchronous side, often referred to as Ascii, there are low-end, limited-editing terminals and full-editing terminals. On the syndhronous side, recognized by the Ebcdic character code, there are three segmented areas: IBM 3270-type, IBM former General Systems Division-type and non-IBM synchronous. The final category, clustered processing, is made up of both synchronous and asynchronous terminals (see chart 1).

Price decline an important factor

Perhaps the most important factor in today's terminal market, in terms of how it affects the end user and vendor, is falling prices. In the past, price was directly correlated to the capabilities of the box. Dumb, low-end terminals typically fell at the bottom of the pricing scale, while full-featured, editing terminals occupied the high end.

The pricing structure changed with the advent of offshore production and technological advances. Not long ago, full-editing terminals carried hefty price tags and were luxury products. Today, they are practically a commodity. In 1983, the low-end Ascii market had only a 10% growth in shipments (see chart 2), while the full-editing market had 30% growth (see chart 3).

The decline of the low-end asynchronous market has caused some of the market leaders to rethink their strategies. Digital Equipment Corp., the leader and standard-setter in the dumb-terminal world, responded to declining sales of the low-end Ascii market in 1983 by introducing an enhanced, cheaper ergonomic terminal line, the VT200. Already, the VT200 has received an overwhelming response from the user world and is on the road to becoming the new industry standard for the full-editing Ascii market, succeeding the VT100, for years the de facto asynchronous industry standard.

Intense price competition in 3270 market

Similarly, the 3270 market has had its share of intense price competition, which has eroded the profit margins of these vendors. IBM, who set the precedence in this market, upset the applecart in March when it made replacements to the mainstay 3278 terminals and 3279 color display. The 3178, 3179 and 3180 are departures from the standard 3278 CRT, and all three represent a new subfamily of low-priced terminals.

IBM's combination of price cuts, more features and fast delivery has raised the pressures in the 3270 market, leaving compatibles little room for maneuverability (see chart 4). Plug-compatible vendors have traditionally offered their products at prices 10% to 20% below those of IBM. As IBM turns more of its attention to the office, these vendors have had to trim their profit margins in order to maintain a presence in the 3270 market. This action has made them more vulnerable than ever.

At the close of 1983, sales for the CRT-based terminal market reached $3 billion. Sales for 1984 look as strong as ever. However, this does not mean that the terminal market has easy times ahead. In addition to capturing some of the terminal market share, micros have caused a great deal of anxiety among terminal vendors, which has led to some hasty business decisions, such as Televideo System, Inc.'s unfortunate jump into the personal computer market. Even more disconcerting are the fierce price wars going on between the compatibles, leading to an inevitable shakeout.

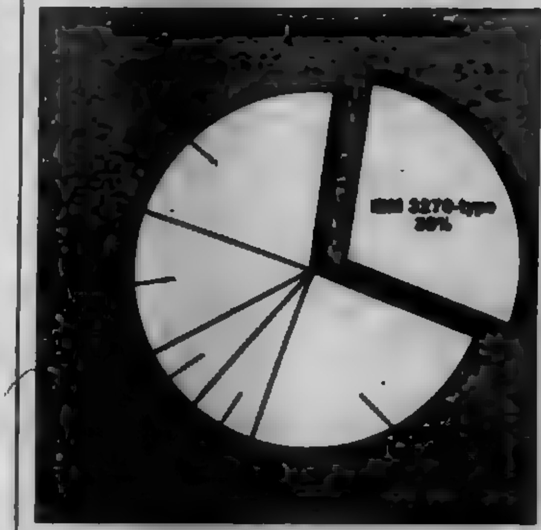

Chart 1. In 1983, vendors shipped 1.78 million CRT-based terminals in the U.S. market. Of these, 45% were low- and high-end Ascii terminals; 48% were IBM 3270-type, IBM General Systems Division-type and non-IBM synchronous terminals; and 7% were clustered processing terminals, including both synchronous and asynchronous machines.

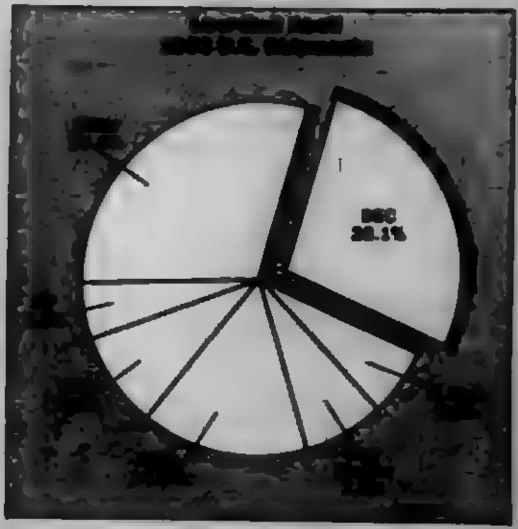

Chart 2. In 1983, vendors shipped 426,850 low-end Ascii terminals, only 10% more than they had the previous year.

Six vendors — Digital Equipment Corp.; Applied Digital Data Systems, Inc. (Adds); IBM; Lear Siegler, Inc.; C. Itoh Electronics, Inc.; and Hewlett-Packard Co. — accounted for 70.6% of those shipments.

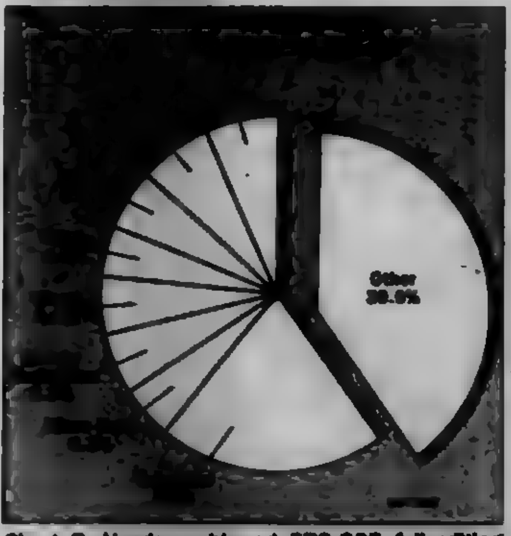

Chart 3. Vendors shipped 379,806 full-editing Ascii terminals in 1983 — a 30% increase over 1982 shipments. Eight vendors — Televideo Systems, Inc.; Hewlett-Packard Co.; Esprit Systems, Inc.; Lear Siegler, Inc.; Liberty Electronics USA; Micro-Term, Inc.; Visual Technology, Inc.; and Wyse Technology, Inc. — accounted for 60.4% of the total shipments.

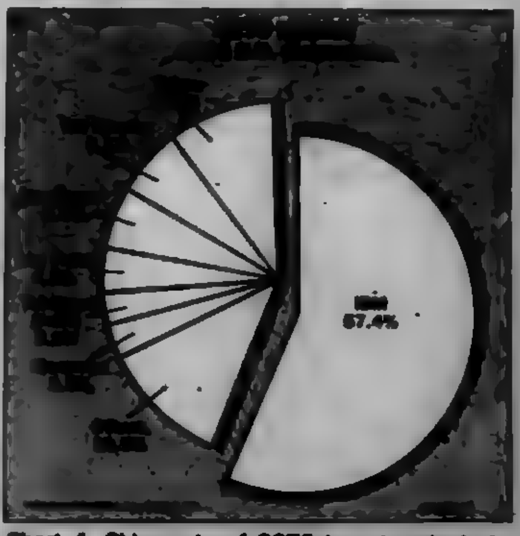

Chart 4. Shipments of 3270-type terminals in 1983 totaled 531,400 machines. Vendors other than IBM accounted for only 42.6% of that number. These vendors — Telex Computer Products, Inc.; ITT Courier Terminal Systems, Inc.; Raytheon Co.; Lee Data Corp.; Teletype Corp.; and Memorex Corp. — accounted for most of IBM's competition in the marketplace.

Goldman is a research analyst specializing in terminals and workstations for International Data Corp., a research firm based in Framingham, Mass.

In battle for terminal, personal computer market

By Joseph Kelly
Special to CWS

Since deliveries began in 1971, the IBM 3270 Information Display System has become the most successful terminal family in the data processing world. Industry estimates placed the installed base of 3270 and 3270-compatible terminals at well over two million units by the end of 1983.

Out of this impressive base, approximately one-half are terminals manufactured by IBM; the remainder are divided among the several plug-compatible vendors that have populated the market, including Raytheon Co.'s Data Systems Division, Telex Computer Products, Inc., ITT and Teletype Corp. The stiff market competition between IBM and the independents recently caused a small shakeout, with Raytheon (formerly IBM's No. 1 3270 competitor) and Mohawk Data Sciences Corp.'s MDS Trivex Division leaving the market.

But what of the predictions of doom for the conventional 3270 display terminal that have been heard in some quarters? Will the terminals disappear in much the same way as punch cards? The answer here is probably not. IBM's market strategy in 1983 makes this clear.

Until 1983, the 3270 product line changed slowly. The initial components consisted of the 3277 cluster display; 3275 stand-alone display; 3271 and 3272 cluster controllers; and 3284, 3286 and 3288 printers. The second generation of products, introduced in 1977, included the 3278 cluster display, 3276 control unit/display, 3274 cluster controller and 3287 and 3289 printers. In 1979, a significant addition to the 3270 family came in the form of IBM's first color display, the 3279. Many users view the 3279 as the product that legitimatized the color terminal as a business tool.

IBM shook up the market in 1983 with a rash of new products. These products signaled that IBM meant to protect its market share from two industry pressures: the rising popularity of protocol conversion as an alternative to 3270 terminals and the microcomputer onslaught.

The most significant of the introductions were the 3178 and 3180 Display Stations, the 3279 Color Display Station, the 3270 Personal Computer and 3278 and 3279 Personal Computer attachment features. Other new products included a large-screen gas plasma display (3290), a terminal multiplexer (3299) and new versions of the 3274 control unit. In addition, IBM reduced prices for several of the older generation products as a first step in phasing them out. IBM's actions directly addressed the two most significant threats to its 3270 installed base.

Many users view the 3279 as the product that legitimatized the color terminal as a business tool.

The display terminal market in which IBM competes is divided into two distinct and equally large segments: the 3270 synchronous terminal market and the Ascii asynchronous terminal market.

The Ascii market has been, for the past three years, involved in a low-end price war. Prices for basic smart terminals fell below the $500 level, with high-end prices dropping to $1,500. By contrast, the IBM 3278 Display Station carried a single-quantity price of more than $2,000 at the start of 1983.

The protocol converter was introduced during this time. With the advent of the

---

Kelly is an associate editor/analyst for Datapro Research Corp., a research firm based in Delran, N.J.

How to be in 16 places

share, IBM 3270 product line positioned to survive

protocol converter, Ascii terminals and printers could change their data formats from asynchronous to synchronous, allowing them to transmit to IBM and IBM-compatible host computers. Although the Ascii terminals did not provide all of the functions found on the 3270 terminals, they were significantly cheaper. In some cases the Ascii/protocol converter combination saved costs by as much as 50%.

IBM countered the price advantage offered by Ascii-to-IBM protocol conversion with the 3178. A compact version of the 3278, the 3178 has a purchase price ranging from $1,660 to $1,720 and provides all of the features found on the older model.

In the long run, the most significant area IBM addressed with its product introductions was that of personal computing. The introduction of the IBM Personal Computer in 1981 affected every segment of the DP industry. One of the areas most affected was the display terminal market. As prices for microcomputers fell, many users replaced display terminals with these machines. The classic intelligent terminal has virtually disappeared. Many industry sources predict the same fate for the general-purpose display. IBM, at least for the time being, has shown that it plans to let the microcomputer coexist with the display terminal.

The first moves in this direction came with the unveiling of the 3278 and 3279 Personal Computer attachment features. These options provided the 3278 and 3279 display stations with personal computing capabilities. The products allowed the 3278 or 3279 display and keyboard to be attached to a Personal Computer processor unit.

IBM's key move, however, came with the introduction of the 3270 Personal Computer. The 3270-PC is a version of the Personal Computer that is intended to be used solely as part of a 3270 cluster. Available in color or monochrome versions, the 3270-PC provides the 3270 user with local processing functions as an integral part of the 3270 system. A key feature of the unit is its windowing capability.

IBM also introduced 3270-PC software. Some view the 3270-PC as one step in IBM's long-range plan to make the Personal Computer the universal workstation of its family of computer systems.

IBM made life difficult

The IBM strategy has made life difficult for its competition. The independent vendors have been forced to scramble to keep up with IBM's new products and lower prices. ITT, Memorex Corp., Telex, Lee Data Corp. and many of the other independents have radically overhauled their product lines in efforts to maintain their shares of the market.

Significantly, each of the vendors has added some personal computing capabilities to its terminal systems. ITT provides for the attachment of the IBM Personal Computer, as well as the ITT Xtra and other IBM Personal Computer-compatible microcomputers. Memorex also supports attachments of the IBM Personal Computer. Telex and Lee Data provide their own intelligent workstations or personal computers; Lee Data also provides a workstation that is compatible with the 3270-PC.

At the same time, profit margins have been reduced as vendors have been forced to lower prices on terminals, controllers and printers to meet the new levels set by IBM. Raytheon's Data Systems Division and Mohawk Data Sciences' MDS Trivex Division folded under these pressures. The shakeout may claim more victims.

As for the predictions of doom, for the time being at least, the replacement of display terminals with microcomputers is not economical. In addition, terminals will probably always be needed for basic data entry applications.

...at once.

With Northern Telecom's unique multi-tasking capability, you can perform a multitude of jobs—simultaneously.

Now your staff can work on spreadsheets, move to word processing, shift to personal computing, then access data and communicate, without missing a beat. No more time-consuming interruptions. Thanks to the unique multi-tasking capability of Northern Telecom's 500 Series Office Information Systems.

With our unique access feature, your staff can leave any application at any point and move to another—and another—while the original task is processed through completion. In fact, the 500 Series will keep track of as many as 16 running programs at once!

Northern Telecom's 500 Series Information Systems also have outstanding communications capabilities. Besides being compatible with each other, they communicate with a multitude of mainframes, including IBM, Burroughs and CDC. They also talk to other minis and even micros such as IBM PC's and Apple.

Our multi-tasking capability allows for up to 16 users to access common files—send or retrieve—from across the hall or across the country. So your people spend less time researching, duplicating efforts and conducting meetings.

Let us show you how easy and cost-effective it is to be in 16 places at once.

Write Northern Telecom Inc., 9705 Data Park, P.O. Box 1222—T-240, Minnetonka, MN 55440; or call 1-800-331-3113. (In Minnesota, call 612-932-8223.)

SPECIAL **REPORT**

Multifunction units to expand share of office market

By George Everhart
Special to CW

The role of personal computers and multifunction terminals in office information networks will continue to change in the coming years.

Single-function terminals, with their significantly lower prices, have already made an impact on the market. As the technology improves and schemes for improving resource sharing grow, multifunction terminals will take on different roles by tapping the resources within a net.

Industry observers are watching how desktop computers and multifunction terminals coexist today. There is potential in systems that supply both the economy and flexibility of a multifunction terminal with the standalone processing power of a personal computer tied in to a network.

Resource sharing

In applications where data processing needs do not require full-time access to a personal computer, multifunction terminals have proven their worth. They provide resource sharing of personal computer functions, printing, storage and mainframe access.

New technology has given the multifunction terminal more utility. This was done by allowing displays to access different resources on a coaxial local-area network. In some configurations, terminals, when they have access to a multiuser personal computer server, take on the characteristics of a personal computer. Those terminals can also access a cluster controller to communicate with either local or remote hosts.

Although resource sharing is a cost-effective solution for many, it does not solve all problems. At times, users need unshared computing and printing power.

The recent innovation of an interface board that provides a direct channel between an IBM or IBM-compatible personal computer and a local-area network gave personal computer users unshared processing power on their desks while allowing them to share the other resources available online.

Standards must keep pace

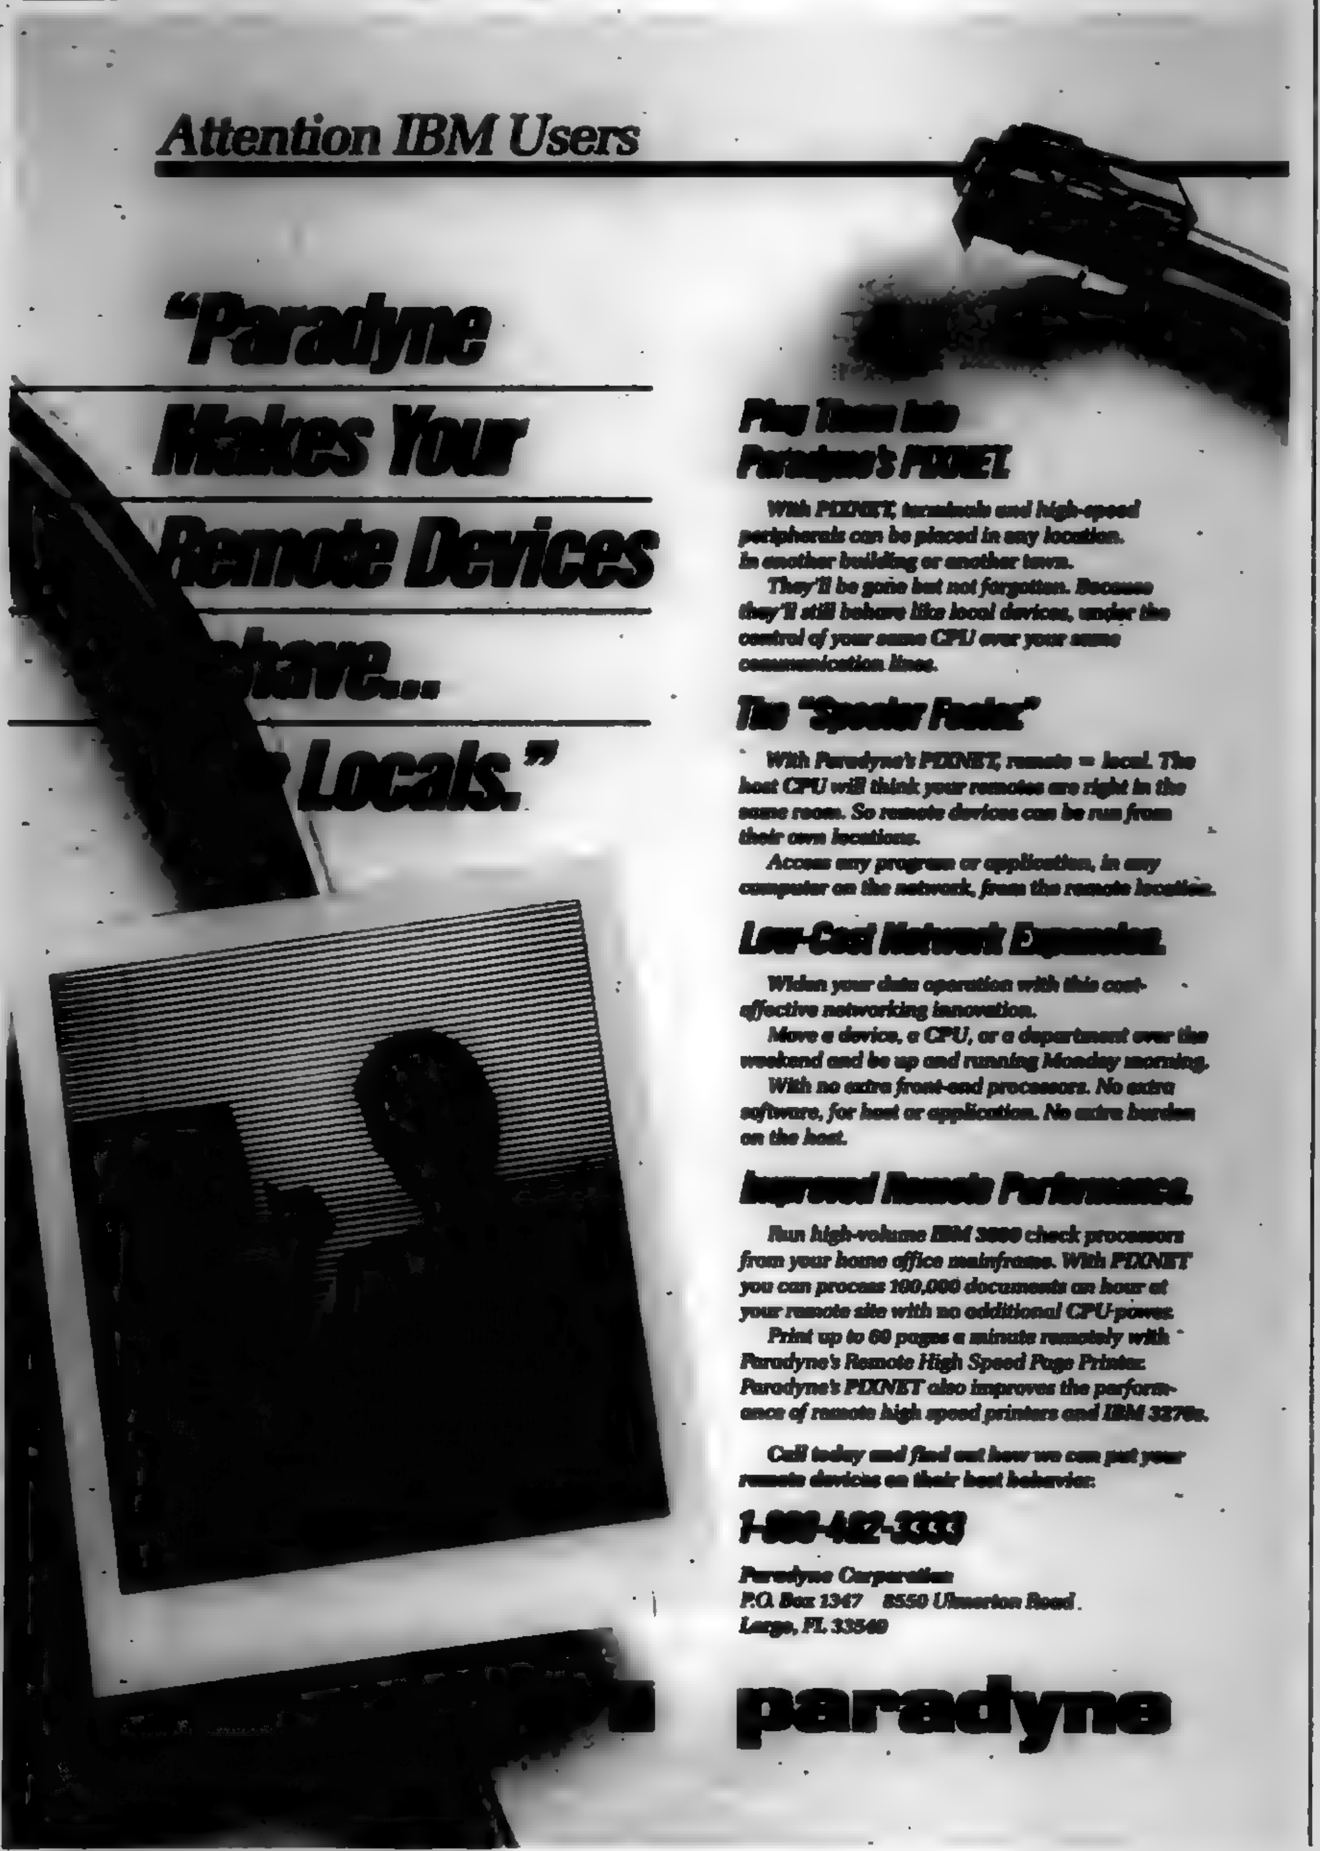
As more users accept the combined use of multifunction terminals and multiuser personal computers on a local-area network, industry standards in this area will be forced to keep pace. The IEEE 802 committees have made significant strides in the search for a common industry denominator.

MIS managers, however, cannot afford to wait years for the solutions to their immediate data processing problems. Managers are confused as to the steps they should take to solve their computing needs while the industry decides on its future standards.

As one solution, some manufacturers have offered resource sharing and local-area network technology using current IBM 3270 coaxial cabling and, where they are in place, gateways to standard local-area networks. This lets users share multifunction 3270 terminals, word processors and personal computers while it saves MIS management from having to make a risky investment in new cable configurations.

If the trend toward sharing resources via multifunction terminals and local-area networks continues, personal computers will be installed only where they are truly needed. There is no reason to install one at every desk. Flexible, multifunction terminals can access communications or applications programs for individuals on an as-needed basis. The terminal will play a dual role in the office information network: that of a personal computer and a data entry/retrieval device.

Everhart is marketing vice-president of Braegen Corp., a manufacturer of data communications terminals based in Milpitas, Calif.



Plug Them Into Paradyne's PIXNET.

With PIXNET, terminals and high-speed peripherals can be placed in any location. In another building or another town.

They'll be gone but not forgotten. Because they'll still behave like local devices, under the control of your same CPU over your same communication lines.

The "Speeder Feeder."

With Paradyne's PIXNET, remote = local. The host CPU will think your remotes are right in the same room. So remote devices can be run from their own locations.

Access any program or application, in any computer on the network, from the remote location.

Low-Cost Network Expansion.

Widen your data operation with this cost-effective networking innovation.

Move a device, a CPU, or a department over the weekend and be up and running Monday morning.

With no extra front-end processors. No extra software, for host or application. No extra burden on the host.

Improved Remote Performance.

Run high-volume IBM 3890 check processors from your home office mainframe. With PIXNET you can process 100,000 documents an hour at your remote site with no additional CPU power.

Print up to 60 pages a minute remotely with Paradyne's Remote High Speed Page Printer. Paradyne's PIXNET also improves the performance of remote high speed printers and IBM 3270s.

Call today and find out how we can put your remote devices on their best behavior.

Communications network keeps freight firm on track

SAN FRANCISCO — A large international freight forwarder here is using a terminal network as a strategic tool to serve its customers' needs.

At the Harper Group, whose customers include General Electric Co., 3M Corp. and other Fortune 1,000 companies, "data processing is really central to the way the business is run," said Jim Smallman, the firm's MIS director. Smallman reports directly to the firm's president.

The Harper Group maintains an on-line freight inventory system that tracks shipments and paperwork for its clients. Three hundred IBM 3270 terminals and printers in 70 of the firm's U.S. offices communicate over private leased lines with an interactive data base that runs on a 16M-byte IBM 4341 at Harper Group headquarters here.

Nine of the firm's major clients have terminals in their own offices connected over leased lines to the freight inventory system; others tie in to the network through dial-up links. Smaller clients rely on the shipper's branch offices to provide them with information from the inventory system.

> *'Data processing is really central to the way the business is run.'*
>
> — Jim Smallman, MIS director, the Harper Group

Clients can reserve space for shipments on planes or ships and can confirm their reservations immediately through phone calls to Harper Group branch offices that are on-line with the freight inventory system. Customers with their own terminals can prepare and revise waybills for the shipments and transmit them for printing to a Harper Group branch or can have waybills that have been prepared by the Harper Group transmitted to them for printing.

The data base enables the firm to provide its larger customers with analyses of shipping routes and orders to help them identify profitable routes and monitor expenses. Additionally, clients who convince their suppliers to book shipments through the Harper Group can use the IBM 3270 terminals or call a local branch office to get information from the data base about shipment schedules, delivery problems and projected costs.

The data base and terminal network give the Harper Group an edge over its competitors. "Everybody in the industry gets the goods from A to B," Smallman explained, but most U.S. shipping firms rely on manual record-keeping systems and cannot provide their clients with as detailed information as they desire.

"There's a lot of pressure to improve the efficiency of our industry," he said.

One of the reasons for the pressure is that large manufacturers — a group that provides the Harper Group with much of its business — are cutting costs by relying on tight order management rather than high inventory levels to keep their plants stocked with necessary manufacturing components. In turn, shippers must provide highly reliable information about delivery dates for goods, Smallman said. "We have systems designed to do that."

Another reason is that customers have begun to buy parts from vendors who provide them at competitive prices, no matter where the vendors are located, rather than purchasing from one supplier in the U.S. The trend requires freight forwarders to provide information to help their clients track shipments.

"If the customer has a problem with an order, he can't just call the local supplier and have it trucked over," Smallman said. "When you're dealing with Hong Kong, Germany and Korea, it's a much more sophisticated, complex control problem."

Fluctuating international exchange rates have also increased the complexity of the services shippers must provide. Increasingly, he said, Harper Group's customers are determining where they trade on the basis of the changing values of international currencies. As these values fluctuate, customers' trade patterns change, requiring more flexible, responsive service on the part of shippers.

"It all boils down to having good data systems," Smallman said. "The future of this business depends on integrated data networks with widespread international coverage."

Harper Group has used the freight inventory system in its domestic offices for about five years. It designed the system with the intention of expanding it internationally as soon as the technology to do so became available. Smallman said the firm wanted to use the 3270 terminals in an international network, but could not justify the cost of private leased data lines for its overseas offices.

The firm considered using a value-added network connected with an asynchronous protocol, but rejected that option because such a network — running over public telephone lines — lacked the high-speed error-checking capabilities Harper Group

WHAT THEY CALL A PORTABLE, WE CALL A LOAD.

Today, almost everyone claims to have a portable computer. The problem is, almost no one does. Most portables have a separate data storage device, separate printer, separate modem, and some even require a separate monitor or bulky battery pack that can make them a liability on the road.

The Sharp PC-5000, on the other hand, is a true portable. It's a compact 16 bit, 128K microprocessor (expandable to 320K) with 192K of ROM, an 80 character display screen, removable bubble memory storage, built-in rechargeable power source and bundled software. It's also available with options like an integrated modem that lets you connect with your mainframe and an integrated correspondence-quality printer which doesn't increase the size of the system. And even with all these features, the PC-5000 fits neatly into a briefcase and weighs under 14 pounds. Almost 25% less than its nearest major competitor. At a price that's lighter, too.

Of course, there's one thing about the PC-5000 that isn't small. Its working capacity. It functions as a desktop computer. And is compatible with a wide variety of MS-DOS* software.

So if you need a truly portable computer, look into the Sharp PC-5000. The one that may be the smallest, lightest—and the best value for the money. In short, a computer that will lighten your work load. Not add to it.

For more information call 1-800-BE-SHARP or fill in the coupon.

Demand for integrated voice/data tools accelerating

By Sandy W. R. Moore
Special to CW

Technology's challenge is to get more functionality into the integrated voice/data terminal's compact package design.

Whether or not a market exists for integrated voice/data terminals is no longer questioned. In the past three years, users have not only accepted the idea of the integrated voice/data terminal, but they are also finding new applications and better software for their use. And what's more important, manufacturers are listening to them.

In early 1984, a number of players, including Rolm Corp., Zaisan, Inc. and Televideo Systems, Inc., announced they were entering what they saw as a high-potential market, while others like IBM, Data General Corp. and Digital Equipment Corp. began making noise about their future participation. With so many players entering the field, it is clear that the market will continue to expand.

The early integrated voice/data terminal market was unstructured and lacked direction. The first integrated voice/data terminal, introduced in 1982, was targeted at the corporate executive.

The principal parties in the early integrated terminal market, Northern Telecom, Inc. and GTE Telenet Communications Corp. were producing voice-oriented devices engineered by voice designers. When the market expanded to include MIS managers and business professionals, manufacturers found themselves trying to sell a voice-oriented integrated voice/data terminal to a DP person. The unit did not meet his needs, so the integrated voice/data terminal market shifted to meet new demands.

Early 1984 was a watershed for both integrated voice/data terminal marketing and technology. Technologically, the emphasis shifted from voice to data. These new terminals had increased access to computer systems and current personal computer-compatible systems that can share fields, software and data simultaneously.

From an applications standpoint, the integrated terminal was no longer strictly targeted toward the corporate executive. It emerged as a tool for anyone looking for ways to improve office productivity.

The integrated voice/data terminal market will continue to expand as more applications are developed. Office workers are finding the voice/data terminal an efficient device. Already, the banking industry is a big voice/data terminal user. At Citibank, for example, employees use these terminals with an 81-number directory to call up key customers or data bases. While talking to the customer, they can scroll necessary data onto the screen.

Doctors use voice/data terminals to access medical data bases for information on new drugs and drug incompatibility, while lawyers use them to tap law data bases for research or recent court decisions. The trucking industry, too, is finding these terminals useful, relying on combined voice and data devices to keep track of pickup, delivery and general disposition of loads.

New uses will progress logically to accounts receivable, purchasing and expediting functions. When a seller, using a voice/data terminal, can scroll up who owes money, automatically dial and then talk to the person, efficiency is increased.

Or, consider the telemarketing industry. With a voice/data terminal, the seller can call up information on a particular client, telephone that client and say, "Our records show you last ordered this product and that data. Do you need to reorder?" The possibilities are endless.

The market will also expand as users begin to appreciate the differences between the voice/data terminal and the personal computer. Voice/data terminals cost less than a personal computer, and while most micros are single-station units, through hardware and software combinations a single IBM Personal Computer can become a multiuser system. In addition, the voice/data terminal offers an element of security control in the office that is sometimes lost through personal computer usage.

As the integrated voice/data terminal market expands, user preferences will occur. Currently, standalone voice/data terminals — those that can be used with key systems, private branch exchanges (PBX) and central office lines — have a market edge. But in the near future, perhaps the 1985-86 period, proprietary voice/data terminals, those that op-

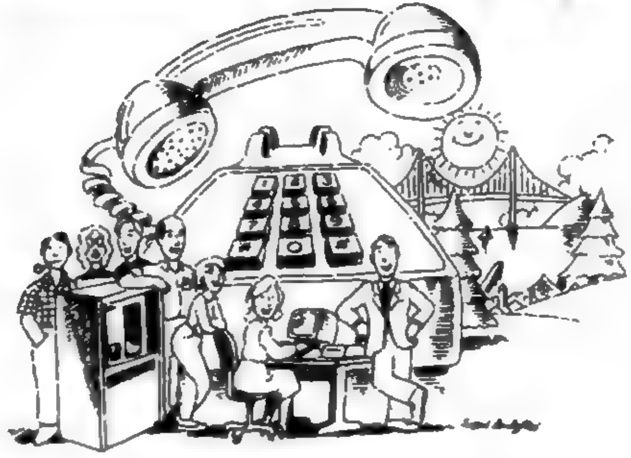
Micro Software on Minicomputers?



Yes. 415-841-9594

We can put your VAX, PDP-11, HP-3000, Eclipse or Nova™ to work running more software at more terminals than anyone.

We do it with The BRIDGE™, software coupled with an add-on board. The BRIDGE makes all terminals work like virtual microcomputers.

You can run all the popular micro software while keeping all the advantages of your minicomputer (enhanced speed, shared data, increased storage, etc.).

The BRIDGE co-processor technology expands your system in an orderly way, without overloading the host. It's a lot better than buying a bunch of microcomputers and trying to tie them together.

(It's also a lot cheaper.)

Virtual Microsystems is a crack outfit of hardware designers, software writers, systems consultants, and helpful support people located in Berkeley, California.

We even have a salesman.

Net processor credited with uniting bank's protocols,

> *'We like to buy the best terminal to fit the job.'*
>
> — W. J. Cole, vice-president of operations, Atlantic National Bank of Florida

JACKSONVILLE, Fla. — Until recently, the commitment a bank here made to use specific terminal equipment — regardless of its communications protocol — saddled the bank with an abundance of leased telephone lines and an overabundance of monthly bills.

Atlantic National Bank of Florida, a statewide institution with 110 branch offices and $3.4 billion in total assets, purchased terminals from different vendors to suit its varied needs. "We like to buy the best terminal to fit the job," according to W. J. Cole, Atlantic's vice-president for operations.

The bank used three types of terminals, which operated under three different communications protocols and utilized different transmission speeds:

- TRW Corp. Teller Assist terminals, which allowed tellers to mark up checks and perform inquiries about customer balances. Atlantic's branch banks operated about 1,100 Teller Assist machines. The machines communicated asynchronously at a rate of 1,200 bit/sec.
- IBM 3270-type CRT terminals from Memorex Corp., Harris Corp. and other vendors. The branch banks operated about 350 CRTs, which communicated using IBM's 3270 bisynchronous protocol at 2,400 bit/sec.
- Diebold, Inc. 910 and 911 automatic teller machines (ATM). Atlantic's branch banks had a total of 185 ATMs, which used bisynchronous protocols to communicate at either 2,400 or 4,800 bit/sec, depending on volume.

"Because of the different protocols and different line speeds, we ran three leased lines from each of our branches," Cole said. Atlantic spent about $100,000 per month on leased telephone lines over which branch banks communicated with headquarters.

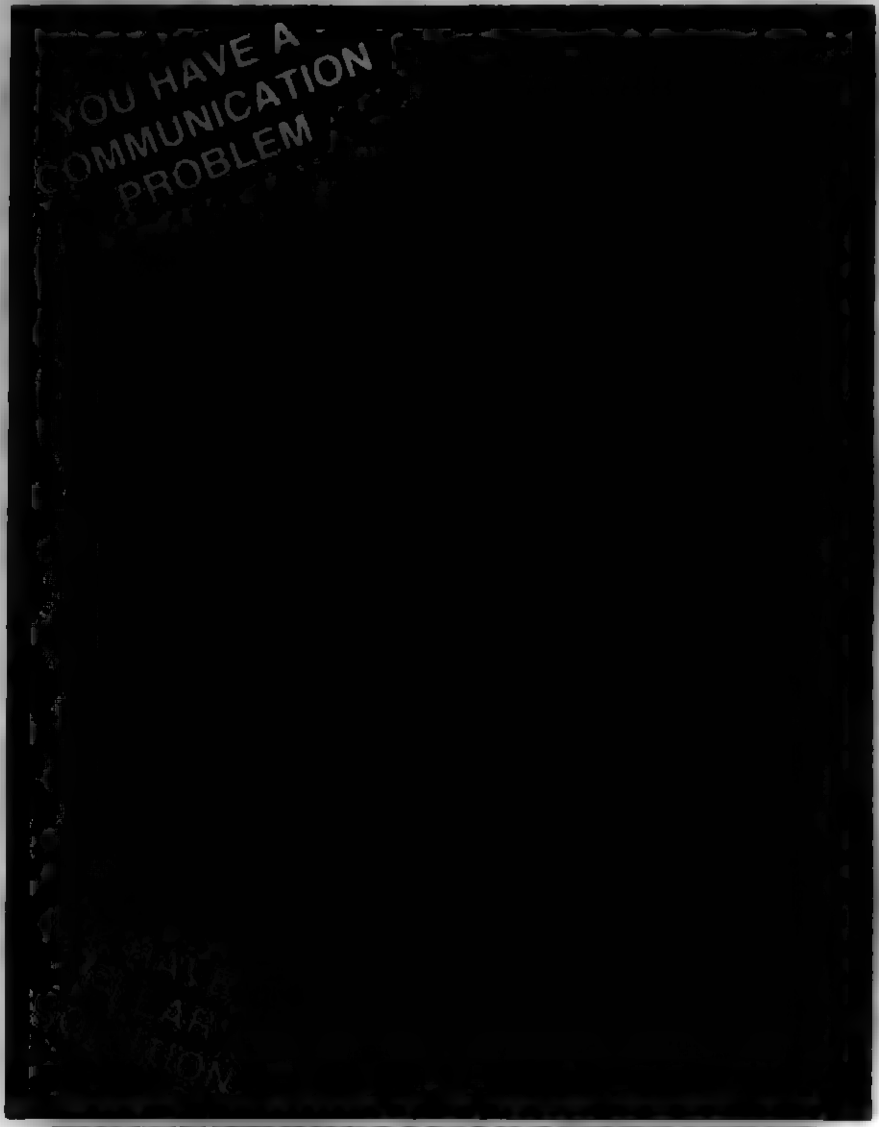
Last year the bank helped Datamaxx USA Corp. develop a host-independent network processor to solve the problem of different protocols. The Communications Management Device (Command) takes inputs from a variety of devices and outputs a signal that Atlantic's front-end processor and host read as IBM 3270 bisynchronous protocol. Atlantic finished installing Command in its branch banks in August.

Cole said use of the units allowed the bank to cut the number of leased telephone lines running from each bank branch from three to one, without changing the terminal configurations at its branches. Atlantic now saves 30% to 40% — between $35,000 and $40,000 per month — in leased-line charges, according to Cole.

Data from the Teller Assist, CRT and ATM terminals at Atlantic's branch banks goes through the Command unit and is transmitted 9,600 bit/sec over a leased line to one of Atlantic's 18 Tandem Computers, Inc. Nonstop II front-end processor nodes.

The nodes, located at one of four regional communications centers, feed the communicated data to the bank's mainframe, a 16M-byte National Advanced Systems, Inc. AS/9050, at its headquarters here.

Besides allowing Atlantic to save



FULL COMMUNICATION CAPABILITIES IN LIMITED DISTANCE APPLICATIONS

For all your networking needs — DATA-VOICE-VIDEO — the clear choice is Fibronics fiberoptic communications, for providing fast, effective solutions. Fibronics is a full-capability manufacturer of complete fiberoptic systems including fiber, cable, optical components, modems, and multiplexers for all limited distance communications application.

If you're in the dark concerning any limited distance application, contact Fibronics. We will have a good understanding of your problem and, more than likely, a clear solution ready and waiting.

CALL TODAY: (617) 778-0700

Fibronics International Inc.

Cable Bandit Unimux 882 and PASCII are trademarks of Fibronics International Inc.
IBM is a registered trademark of the International Business Machines Corporation.
ITT Courier is a registered trademark of the International Telephone and Telegraph Corporation.
TELEX is a registered trademark of the TELEX Corporation.
Memorex is a registered trademark of the Memorex Corporation.
Raytheon is a registered trademark of the Raytheon Company.

FM-800 VOICE & DATA
The UNIMUX 882™ is used either to transfer bulk quantities of voice and data in large data centers or for high density node applications. The UNIMUX carries up to 128 data and/or voice circuits including IBM 3270, RS-232, V. 35, analog voice, TTL and more. It can be used in DCE to DTE or DCE to DCE networks.

FM-1600 HIGH SPEED DATA
The FM-1600 Cable Bandit™ Series multiplexer systems can reduce your cable (fiberoptic or coax) requirements 32 to 1. The Cable Bandit can connect two similar or different controllers within one system and is compatible with IBM 3270, ITT Courier, Telex, Memorex, Raytheon and others.

FOV-4000 CAD/CAM
The FOV-4000 Series fiberoptic links extend the distance up to 3 km between the CPU and CAD/CAM workstations. High resolution monochrome or color transmission is accomplished with multiplexed data.

FM-900 UNIBUS EXTENDER
The FM-900 Series permits the extension of a DEC UNIBUS up to 3 km from a VAX or PDP-11 computer. This fiberoptic bus extender can transmit full duplex data for high speed line printers, monitors and color graphics display generators.

PC-3000 PASCII™ PROTOCOL CONVERTER
The PASCII™ protocol converter allows IBM 3274 controllers to communicate with asynchronous ASCII terminals/printers without requiring a front end controller (i.e. 3705).

OPTRONICS
Fibronics offers a wide variety of fiberoptic cables, standard and specialty, for use in indoor/outdoor, direct burial, military and plenum applications with complete

from SR/7

wanted, Smallman said. "You've got to have fully error-checked protocols when you're moving the kind of financial and technical data we are."

He said the firm chose to wait for a more reliable means of connecting its international offices to its information network.

Immediate purchase

This year, Computer Sciences Corp. began offering a value-added network with an error-checking high-speed bisynchronous protocol and virtual circuits. "When that became available, we got it immediately," Smallman said.

The Harper Group will bring offices in London, Hong Kong and Sidney, Australia, on-line this month over the value-added net. Branch offices in Japan, South Africa and Germany are scheduled to go on-line by March.

According to Smallman, in the future, the company may install dedicated leased lines in some foreign offices if business volumes increase enough to justify the expense of the lines.

With the foreign Harper Group offices' current volume, dedicated lines would cost about five times as much as the value-added network, Smallman said.

cutting costs

money, the processor also gives the bank more options when it looks to buy new equipment. Before it installed the Command units, Atlantic required new equipment to have a protocol that matched one of the three already in use, Cole said. "Now we don't have to worry about that anymore."

The Command unit allows data that communicates over standard communications systems to be transmitted over the single phone line that runs out of each branch bank, so restrictions on new equipment are minimal, Cole said.

Each command unit includes a CRT terminal from which analysts can run diagnostics on the system. The terminal also provides on-line access to information in Atlantic's mainframe. Cole said this feature allows small branch banks that could not justify the cost of a CRT terminal for on-line use to purchase a terminal that allows both access and communications savings.

Each Command unit costs Atlantic $6,000, including the CRT terminal. Atlantic receives a discount from Datamaxx because it helped develop the unit and it buys in volume. Per-unit prices for the unit range from $6,000 to $8,200, depending on configuration and number purchased.

Atlantic has equipped all of its bank branches with Command units and has installed 120 of the network processors.

The bank keeps about 10 spare units in storage in case operating units break down in the field. Cole said the bank saves time by installing the spare units, rather than waiting for repairs. When a faulty unit has been replaced with a working one, Datamaxx repairs the broken machine, and Atlantic puts the repaired unit in storage to serve as a replacement machine later.

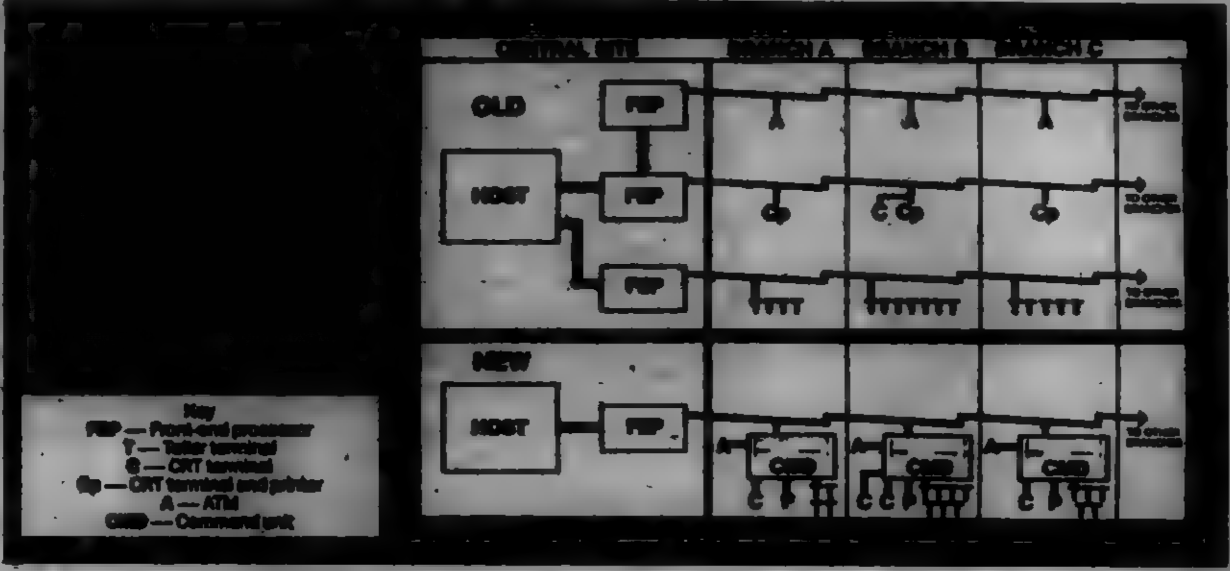
VOICE from SR/8

erate, for example, with a Rolm or a Northern Telecom PBX, will see a greater market edge. This will be partly because of the potential for messaging systems.

By 1987, the market will likely shift back to stand-alones, provided the technology does not slow down and integrated voice/data terminal prices decrease. By then, manufacturers will be able to put more processing power and other features into a smaller space and reduce heat and ventilation problems. Technology's challenge is to get more functionality into the integrated terminal's compact package design.

The marketing challenge for the future will be to find new integrated voice/data terminal applications. Those industries that deal with renewals, such as insurance, and the general consumer market can benefit from integrated terminal applications. The market has proved that users will pay over $1,000 for these terminals. Manufacturers must lower that figure for users who will want to use electronic mail systems and to tap into a wealth of data bases.

In its short history the integrated voice/data terminal has come a long way. One point does seem certain: The integrated voice/data terminal is here to stay.



Can you picture a local voice/data network that is powerful, practical and priced right ...even for very small groups of users? It's real. And we've installed more than 40,000 channels.

That's right. At Teltone, we've been showing companies large and small how to manage growing voice and data networks for years, and "cost-effective" is our middle name. Right now, for example, our Data Carrier Systems are helping more than 500 companies extend the useful lives of their telephone systems by letting them double as local data networks. For as little as $450 per channel, DCS enables users to route synchronous/asynchronous data, at up to 9600 bps, to virtually any existing telephone jack. This makes adding or moving a terminal as easy as plugging in a phone—no modems, no cable, and no disruption of voice traffic at any time. We also offer a full line of high-performance multiplexers and other networking products, but most of all we provide expertise. When you do business with Teltone, you deal with our own applications experts—people who know networking inside out, and share your concern about controlling costs. If this sounds like a good idea to you, let's talk. We have offices nationwide, and we'd welcome a chance to communicate with you.

Software lets firm keep track of leases, anticipate bills

NEWPORT BEACH, Calif. — When an equipment upgrade forced the data center of an insurance firm here to take a hard look at its equipment accounting practices, it found them lacking.

"We really had no idea how much book value was left on certain items, which items were purchased and which were leased, where we stood on investment tax credits and what the various components of the data center were really costing us per month to operate," said George Beveridge, an independent consultant on retainer for Pacific Mutual Life Insurance Co.

PACIFIC MUTUAL

During its equipment upgrade in 1982, Pacific Mutual brought in a 24M-byte IBM 3081 to replace two National Advanced Systems, Inc. machines. It has since added peripheral components, and the firm's data center now includes about 400 Lee Data Corp. terminals, including 1216s, 1230s and 1220s; seven IBM 3287 and 3289 terminals; and other equipment.

The 400 Lee Data terminals, with their associated controllers and keyboards, represent at least 900 discrete components.

The firm realized it would have to change its accounting practices to keep track of financial information for all those components.

Beveridge said few item-by-item records had been kept on equipment in the old configuration after it had been acquired. Record keeping had been turned over to accounting, which handled it according to corporate financial needs.

On the books, components were grouped in categories that were too general for the data center's accounting needs.

He began looking for a network management software package that would allow Pacific Mutual to manage finances for the equipment in the new system. He decided on Netman from California Software, Inc. because it offered the financial capabilities the data center needed and features for tracking components. Pacific Mutual installed Netman in early 1983, shortly after installation of the new hardware.

The software package tracks information such as vendor, terms of the contract for lease or purchase, maintenance contract details, date of order, delivery and installation.

Pacific Mutual leases its Lee Data terminals from a third-party lessor and has been ordering about 25 new terminals each month.

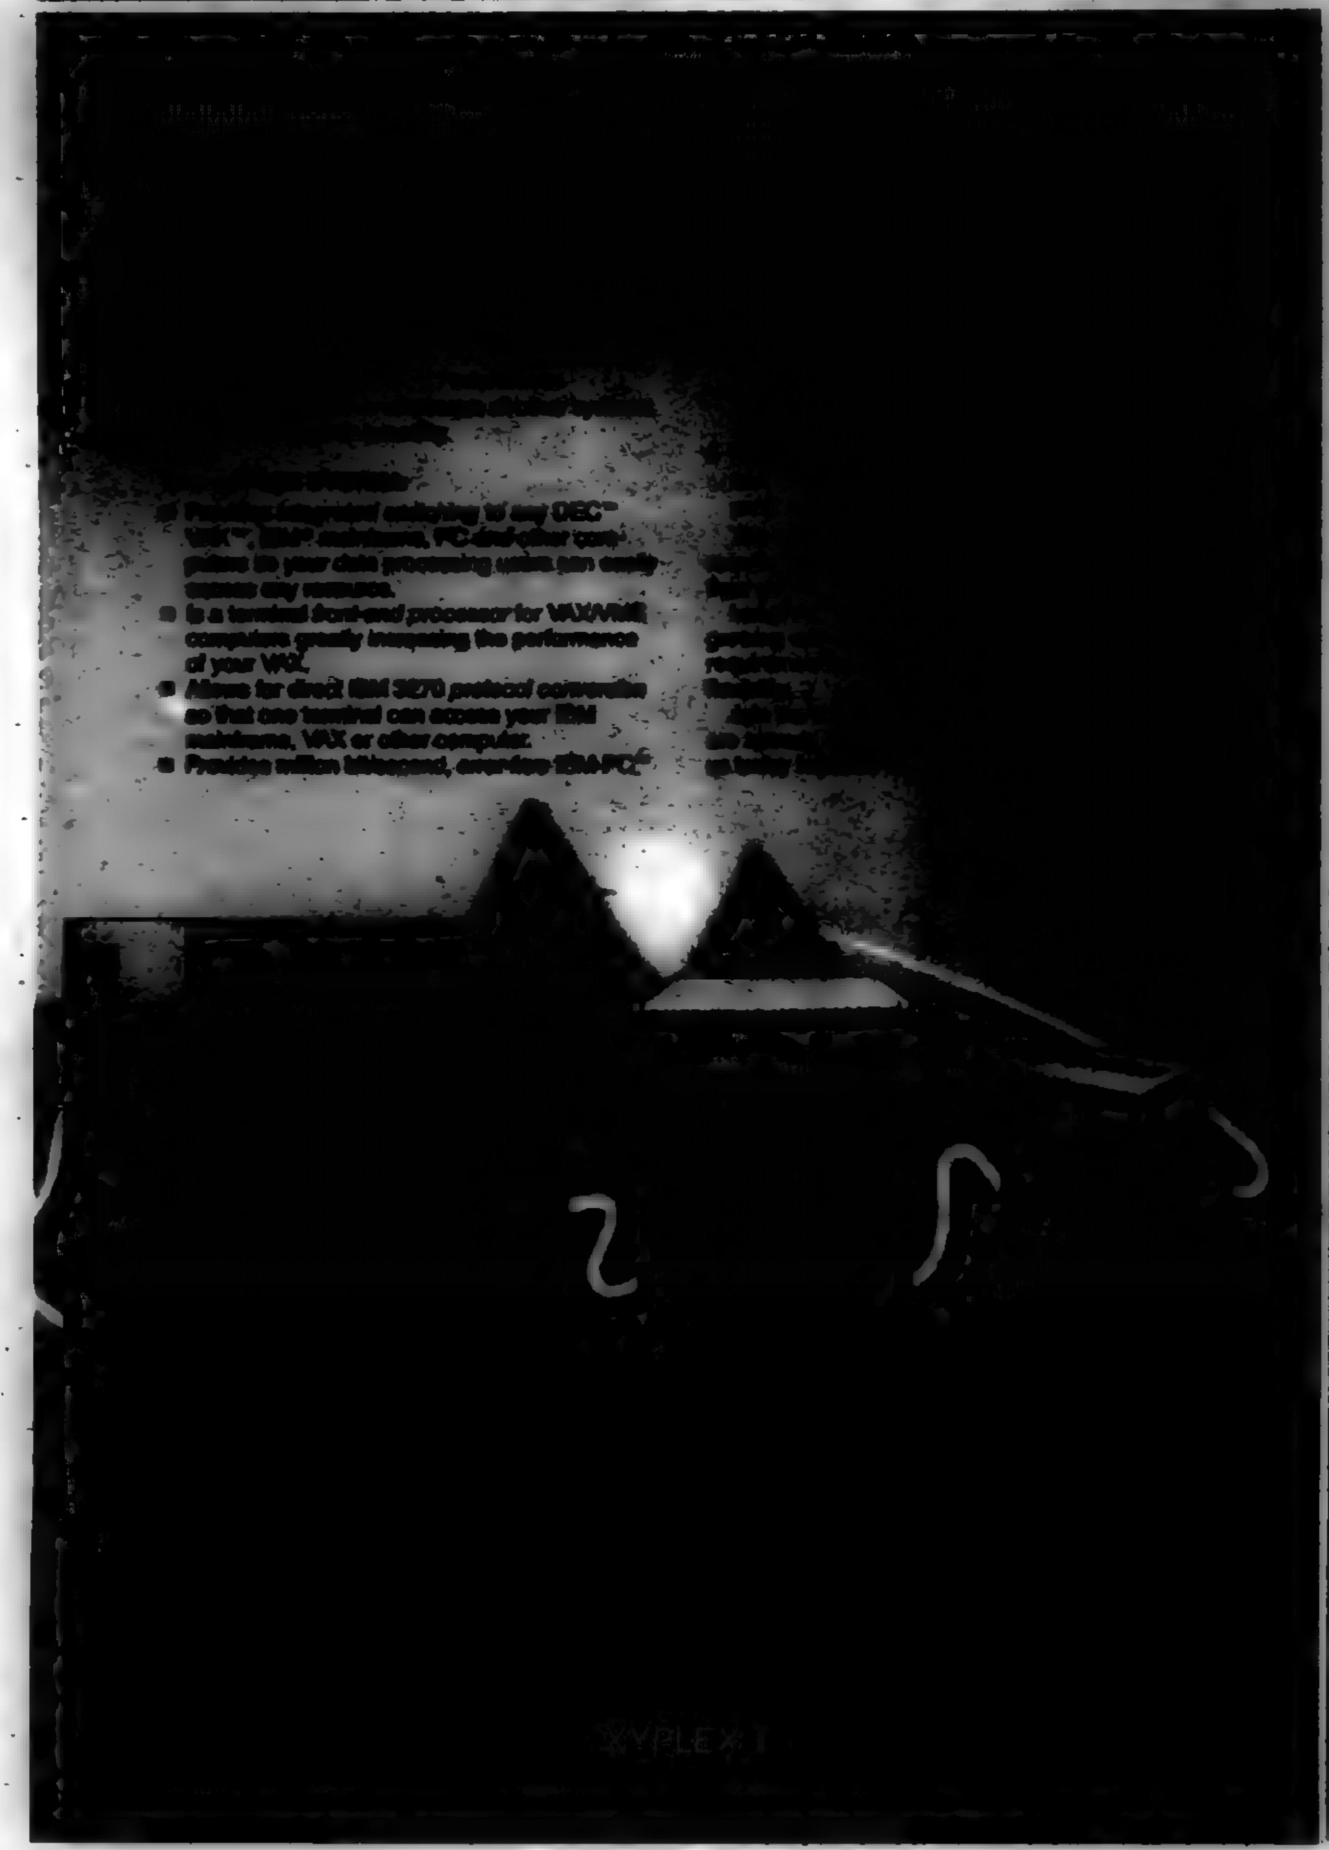
Because the firm enters data on new leases when it orders equipment, rather than when it installs them, it can anticipate what lease invoices it will receive in any given month, Beveridge said. When invoices arrive, the data center staff checks them against expectations and notes any discrepancies.

Keeps track of money

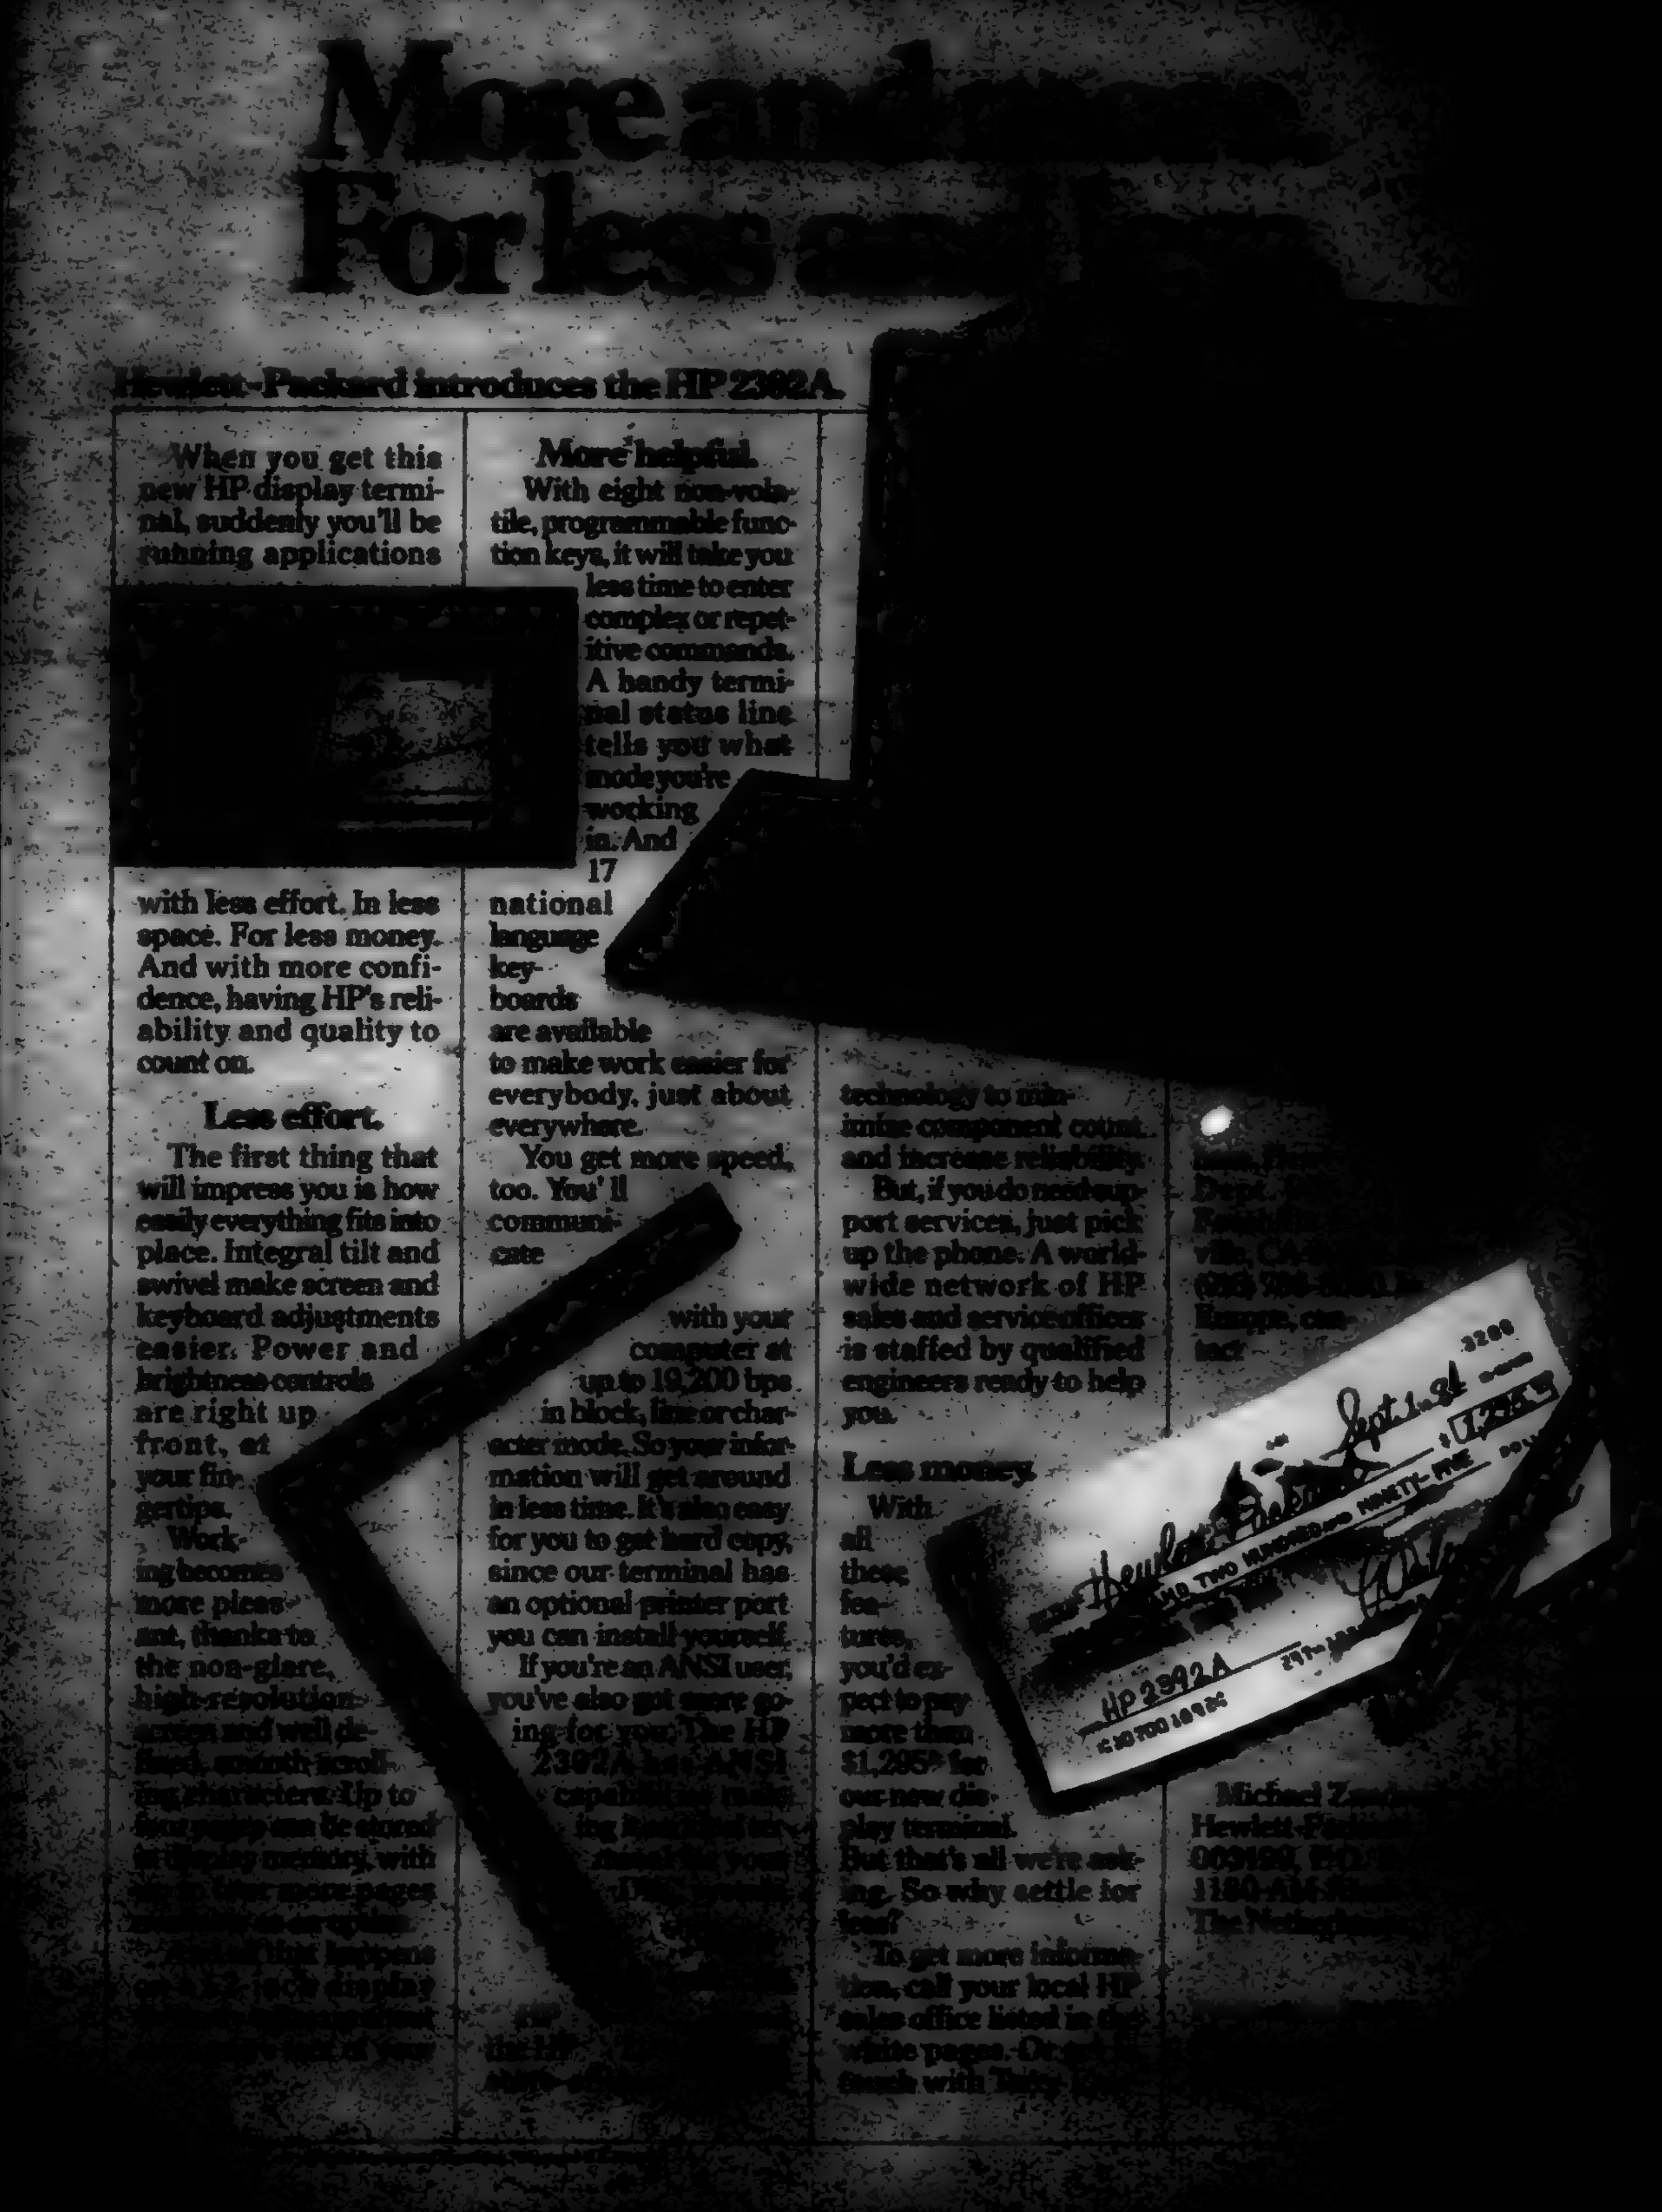
Beveridge said this capability is important for Pacific Mutual because it has leases on hundreds of terminals and controllers. If the firm loses track of the money it has agreed to pay for this equipment, it cannot check whether its vendors are billing it according to contract specifications, Beveridge said.

For the IBM terminals, Pacific Mutual uses the package to monitor its credit accruals toward purchase. Beveridge said that credits maximize at 50% of the purchase price. Netman's monthly reports list where the IBM accruals stand, and when they approach 50%, the firm decides whether to purchase the terminals. If the terminals will be in use for a while, purchasing generally makes economic sense, he said.

Pacific Mutual also relies on the package to keep track of contract expiration dates, investment tax credits on its terminal leases and internal chargeback to user departments.



- Is a terminal front-end processor for VAX/VMS computers greatly increasing the performance of your VAX.
- Allows for direct IBM 3270 protocol conversion so that one terminal can access your IBM mainframe, VAX or other computer.



More and [illegible]
For less [illegible]

Hewlett-Packard introduces the HP 2392A.

When you get this new HP display terminal, suddenly you'll be running applications with less effort. In less space. For less money. And with more confidence, having HP's reliability and quality to count on.

Less effort.

The first thing that will impress you is how easily everything fits into place. Integral tilt and swivel make screen and keyboard adjustments easier. Power and brightness controls are right up front, at your fingertips.

Working becomes more pleasant, thanks to the non-glare, high-resolution screen and well defined, smooth scrolling characters. Up to four pages can be stored in display memory, with [illegible] more pages [illegible]

[illegible] that happens [illegible] display [illegible]

More helpful.

With eight non-volatile, programmable function keys, it will take you less time to enter complex or repetitive commands. A handy terminal status line tells you what mode you're working in. And 17 national language keyboards are available to make work easier for everybody, just about everywhere.

You get more speed, too. You'll communicate with your computer at up to 19,200 bps in block, line or character mode. So your information will get around in less time. It's also easy for you to get hard copy, since our terminal has an optional printer port you can install yourself.

If you're an ANSI user, you've also got more going for you. The *HP 2392A* has ANSI capabilities making [illegible] terminal for your [illegible]

[illegible] the HP [illegible]

technology to minimize component count and increase reliability.

But, if you do need support services, just pick up the phone. A worldwide network of HP sales and service offices is staffed by qualified engineers ready to help you.

Less money.

With all these features, you'd expect to pay more than $1,295* for our new display terminal. But that's all we're asking. So why settle for less?

Purchasing gear need not cause terminal headaches

By Jack R. Rule
Special to CW

Tomorrow's workplace will require office machines that communicate easily with each other and that are compatible with any data base.

Determining a company's data processing needs was once the domain of the MIS or central DP department. This is not so today. Today, managers at the local departmental level are often faced with the task of selecting the hardware and software that will meet their departmental needs.

How does a manager with little experience in purchasing hardware and software, in this case terminals, cope with the myriad systems choices that are currently on the market? One key fact to remember is that five types of terminals will be needed for the office of today and tomorrow:

- Dumb terminals.
- Word processors with access to personal computers.
- Terminals with graphics capability.
- Terminals that combine the previous three categories.
- Computer-aided design and manufacturing systems that can interact with all the above categories.

There is a rationale behind this selection of terminals: It does not make sense to put expensive data terminal equipment, such as a personal computer, on every desk. If the application calls for a dumb terminal (for inventory control, for example) or a dumb terminal with a personal computer attachment (for a manufacturing application), then these terminals should be used.

Tomorrow's workplace will require office machines that communicate easily with each other and that are compatible with any data base. Departments will be custom-tailored by managers using a combination of equipment and software resources. Furthermore, staff will be able to communicate data, voice and video pictures from their individual terminal workstations. Equipment will be easily expandable.

Presently, terminals are available that go a long way in this direction. Some current models are capable of accessing many sources of information, including multiple mainframes. To manage data flow, local-area networks have been developed that use gateways to allow terminals to access data base sources. Local-area networks are now available that allow up to 500 data processing devices, including those manufactured by different vendors, to communicate with each other. Trends are moving toward fully integrated and expandable offices that let users access information from any office.

Today's local department manager has more responsibility and has assumed an important role in office automation. The manager's decisions can make a vital difference in company productivity and market share.

Local managers assumed the responsibility for equipping their offices slowly as DP became less localized and the demand for full OA increased. Also, as software packages emerged that made applications development by the nontechnical user possible, it became clear that the department that was going to be using the application software should have the final decision over its purchase — not the MIS manager.

It should come as no surprise, however, that some department managers accepted these duties with discomfort. Many had relatively little experience with the sophisticated technology.

In the early days of the first mainframes, the task of managing a company's automated resources resided in the hands of an army of central DP gurus, about whom the rest of the company knew little. At that time, DP configurations were fairly inflexible. The mainframe performed maintenance and updates on data as well as the heavy-duty processing.

In those days, most terminals were dumb, asynchronous types, which could only accept information and perform light analysis functions. Productivity boosters that we take for granted today like real-time, online processing and multitasking were unknown. The mainframe was used to process scheduled jobs consisting of large amounts of raw data. End users typically received the processed results of their work at month's end.

Defining and implementing application programs and finding the hardware that could run these programs, as well as planning the allocation of resources for the future, was

Now your best buy in general purpose video display terminals is even better.

Lear Siegler's popular ADM 11 conversational and ADM 12 block mode terminals are available with more design flexibility and system compatibility.

In addition to standard compatibility with Lear Siegler terminals, you can now get compatibility with ADDS Viewpoint and Regent 25, Hazeltine 1400, 1420 and 1500, DEC VT52, and TeleVideo 912/920, 925 and 950.

You can enjoy Lear Siegler's superior performance and reliability, ergonomic design and High Touch™ style in more applications than ever before.

Call your local distributor or contact us directly for complete information on the ADM 11 and ADM 12 video display terminals.

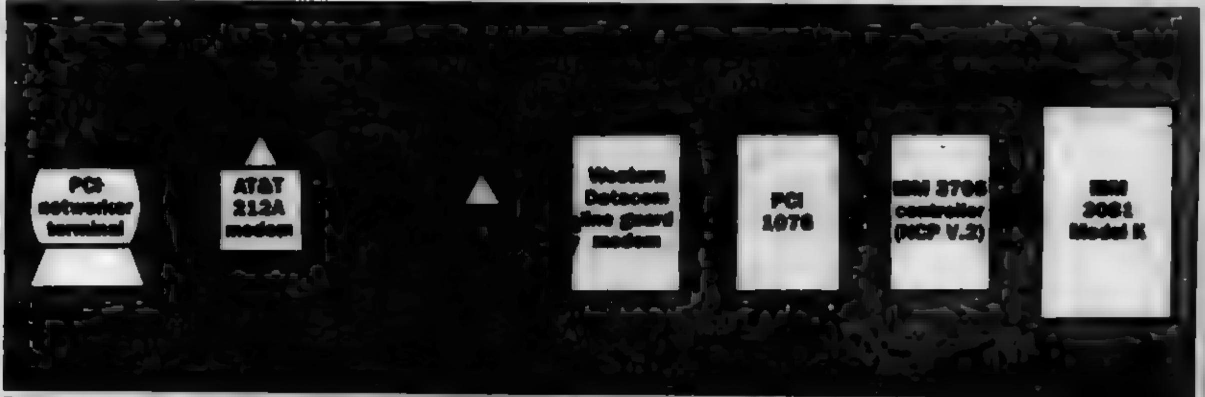
Bargain net helps DP staff get system on-line on time

By Raymond Bugg
Special to CW

ARDSLEY, N.Y. — Starting from scratch, the data processing shop at a division of Ciba-Geigy Corp. acquired terminals and a communications network for a newly acquired plant in Delaware and brought them on-line with the corporate data center here within about three weeks, in time to transmit data on its first day of operation under its new owner.

The data processing shop, the information systems department of Ciba-Geigy's Plastics and Additives Division, managed the speedy setup even though the equipment it had deemed necessary for a communications link between the plant and the firm's data center arrived a month and a half after the acquisition took place.

The solution that allowed the information systems department to accomplish its task was an interim communications network that cost the firm only $3,000, plus communications line costs.



PCI networker terminal
AT&T 212A modem
Western Datacom line guard modem
PCI 1076
IBM 3705 controller (NCP V.2)
IBM 3081 Model K

The interim communications system linked Ciba-Geigy Corp.'s plant to its data processing center through a series of steps designed to maintain security. A user at the Delaware plant initiated a voice telephone call to the data center via one of two direct business lines attached to the Protocol Computers, Inc. (PCI) Networker Terminals. A Western Datacom Co. Line Guard modem at the data center received the call and issued a password request to the user, who entered his password on the terminal. If the password was accepted, it caused a line disconnect and initiated a callback to the user's predefined business line. When the callback was completed, the Line Guard modem passed control to the PCI 1076 protocol converter, hooked to the data center's IBM 3081 Model K through an IBM 3705 controller running IBM's Network Control Program Version 2. The protocol converters allowed IBM 3270 emulation, giving the user access to applications that resided on the host.

The Plastics and Additives Division of Ciba-Geigy develops a range of specialized industrial products, such as chemical and light stabilizers. Its information systems department consists of a small staff of consultants, which elicits assistance for specific projects from Ciba-Geigy's corporate data processing shop, the management services department.

Ciba-Geigy's corporate data center here, located approximately 10 miles from the division's headquarters in Hawthorne, N.Y., maintains a 12M-byte IBM 3033 that the division accesses through remote job entry and a 24M-byte IBM 3081 Model K that it accesses via an on-line, real-time 3270 network. The mainframes provide CICS, TSO and IMS facilities.

On Dec. 15, 1983, the information systems department learned that Ciba-Geigy Plastics and Additives was contemplating a business acquisition. Ciba-Geigy's corporate management had signed a letter of intent to acquire a portion of the E. I. Du Pont De Nemours & Co. organic pigments business.

The acquisition was to include the Delaware plant, which would continue its role as the primary source of product production. The final agreement date was to be sometime during the first quarter of 1984.

The acquisition was to include only one piece of the plant's hardware — a Hewlett-Packard Co. HP 3000 — and no operational systems for inventory management and other critical applications. The plant had operated a manual inventory and pricing system, and its staff was unfamiliar with on-line technology.

Yet the division needed applications to be up and running on the first day of postacquisition operation to minimize any disruption in customer services and production processes and to maintain data as accurately as possible on the new product line.

Once the acquisition was imminent, the management services department developed the definition and scope of the project to link the plant with Ciba-Geigy's data center and assembled an acquisition team. The project team consisted of members from several of Ciba-Geigy's corporate MIS departments who took responsibility for application development, hardware procurement and installation.

An analysis by the team determined that the newly acquired business should, whenever possible, be incorporated within divisional and corporate systems. In line with this plan, the team decided to reconfigure the HP 3000 to provide a remote job entry link to the data center's 3033 and to install a leased-line 3270 network to provide access to CICS and the Plastics and Additives Division's order entry and inventory system, which ran on the company's 3081.

For accessing the 3081, the team chose a network consisting of IBM 3270 equipment — one 3276 display controller and four 3278 CRT terminals — which would access the division's host processor via leased, private data lines.

In February, a final acquisition date of April 12 began to surface, and the team placed orders for the hardware and communications lines.

But Ciba-Geigy's Telecommunications Group, which held responsibility for equipment acquisition, pointed out to the project team that the targeted installation dates for the ordered hardware and data lines were in jeopardy: The projected ship dates for the IBM equipment fell more than a month after the acquisition date, and the AT&T divestiture caused delays in the installation of the data lines.

With the assistance of the Telecommunications Group, the project team established criteria for a viable setup the division could use until equipment and lines for its permanent system arrived and could be installed. The following were the criteria for the interim setup:

- It should be a 3270 look-alike to reduce the need for redundant training once the permanent-environment was in place.
- It should consist of easily installed, off-the-shelf equipment because of the time frame.
- It should also be as inexpensive as possible because the effort would represent a short-term solution.

With these criteria in mind, the Telecommunications Group recommended the use of a dial-up terminal that would allow 3270 emulation.

The corporate data center had a Protocol Computers, Inc. (PCI) 1076 protocol converter resident on its 3081 mainframe, and the Telecommunications Group advised the project team to use an associated terminal, the PCI Networker Terminal, as the dial-up 3270 look-alike.

The Telecommunications Group ordered all the required equipment and received it within a matter of days. The interim configuration consisted of:

- Two PCI Networker Terminals, chosen because of their resemblance to the 3270s the firm had on order.
- Two Penril Corp. 212A 1,200 bit/sec modems, chosen because they were available immediately.
- Two direct nondata business telephone lines. Ciba-Geigy chose the nondata lines because they could be installed within 10 days after they had been ordered. The 9,600 bit/sec data lines the firm had ordered for its permanent configuration required a 100-day waiting period from order to installation.

Within three weeks of the decision on the interim processing setup and about a week before the acquisition date, the configuration was up and running. The interim configuration resulted in a totally functional off-site operation that met the targeted acquisition date.

On April 12, the plant's first day of operation under Ciba-Geigy management, the facility sent data on inventory levels to the division's mainframes.

By June, the permanent leased data lines had been set up and the IBM terminals installed. The information systems department replaced the interim network with the permanent one.

The PCI Networker Terminals are now being used by some of Ciba-Geigy's technical employees as home terminals that tie in to the corporate mainframes.

Ciba-Geigy' Plastics and Additives Division plans to include the use of the PCI Terminals in future acquisition plans.

Bugg is a senior systems consultant with Ciba-Geigy Corp. at the firm's Hawthorne, N.Y., plastics and additives division.

Expanding ATM networks draw consumers' interest,

By Robert W. Mahoney
Special to CW

Our financial delivery and payment systems are radically changing. The rapid growth of electronic funds transfer (EFT) has been spurred by the consumer acceptance of automated teller machines (ATM), the growth of shared ATM and EFT networks and the proliferation of credit and debit cards.

In the near future, consumers will use ATM debit cards and self-service terminals to buy fuel for their automobiles, obtain coupons electronically for discounts on brand name merchandise, buy airline tickets, buy tickets to sporting events and concerts and even buy lottery tickets.

The customer will use an ATM debit card, which interacts with a terminal on-line to a data base, to pay for groceries at the supermarket, to purchase items from electronic catalogs and even to receive government benefits such as food stamps, aid to dependent children and unemployment compensation.

By the end of 1983, over 40,000 ATMs were in use across the U.S. More than 100 million ATM debit cards are now in consumers' hands. They are used to perform more than 3.4 billion transactions a year. These transaction numbers are projected to reach 10 billion annually by the year 1990.

The future scenario for ATM debit and credit cards includes automated ticketing to purchase transportation, entertainment and gaming tickets. Currently, Avis Rent-A-Car Systems, Inc. uses transaction terminals for its automated Avis Rapid Return service, letting customers return cars and receive a printed record of expenses.

Avis plans to extend that program to "Rapid Rental," wherein the customer can make reservations, receive a finalized contract and learn the parking location of the rented car by using a self-service terminal.

Self-service technology also offers the potential to automate government benefits distribution.

The distribution costs of government welfare programs are increasingly expensive. Studies conducted in several states revealed that the distribution costs for unemployment checks is $2 to $5 for each check; welfare checks are $7.50, and food stamps are $1.75 to $3.00. Couple these costs with transaction volumes that range from 150,000 to 200,000 per month in Arizona to 3.5 million to four million per month in New York, and the magnitude of this problem becomes more visible.

Add one more dimension to these numbers. There are 10.5 million people in this country receiving welfare benefits, 22.7 million on Medicaid and 21.6 million receiving food stamps. Both ATMs and point-of-sale (POS) terminals can reduce the costs of check dispersal and reduce fraud, which is a major problem with today's distribution system.

Perhaps a more current ATM issue is the growing number of joint ventures between financial institutions and retailers.

Today, there are approximately 245,000 convenience stores and gasoline stations. These locations are suited for self-service EFT devices because they are fast-service operations and many are open 24 hours a day. As a result, many large chains are installing direct debit scrip terminals, cash dispensers and automated fuel systems that allow customers to pay for their gas and convenience items either by cash, debit or credit card either at the island through an automated fuel system or in the store with a POS terminal.

Island fuel terminals operate like the ATM. Automated fuel systems control fuel delivery and pricing as well as payment.

Cash dispensers are becoming popular with retailers who have high customer traffic. Why cash dispensers and not full-service ATMs? Facts indicate that cash dispensers are more cost-effective in this environment because of their lower purchase price and service costs.

The 29,000 supermarkets now in the U.S. are

Using an ATM, Avis customers that are returning cars can automatically process their rental agreements and receive a record of charges without talking to a rental agent.

Mahoney is president and chief operating officer of Diebold, Inc., a Canton, Ohio, manufacturer of automated teller/electronic funds transfer machines.

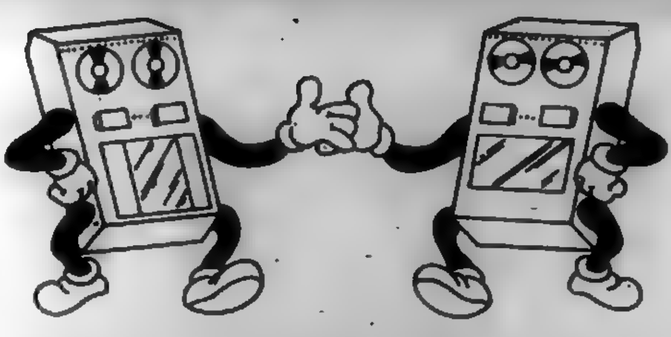
"YOUR INTEGRATION NEEDS ARE UNDER CONTROL"

OUR SWITCHES MAKE YOUR IBM SYSTEMS WORK LIKE A TEAM!



If you have more than one IBM or plug compatible processor, Digital can help you get the most for your hardware investment. Our switches allow you to achieve backup and peripheral configuration flexibility at a fraction of the cost you're probably thinking.

Whether you have two processors or more, Digital has a switch to suit your requirements.

- Model 4101 The lowest priced matrix switch on the market.
- Model 3421 The only manually operated channel switch in the industry.
- Model 3403 A remote controlled channel switch designed for underfloor installation.

process 3.4 billion requests a year

probably best positioned as delivery points for financial services.

Another possible use of ATMs in the future is the placement of direct debit and check/credit authorization terminals in specialty stores within shopping centers. These networks would broaden the base of automated payment services and produce communications cost savings.

Clustering ATMs, cash dispensers and other payment terminals in a kiosk at the supermarket entrance, for example, in addition to preauthorization of debits, would allow a user to get cash, make a deposit, pay a bill, transfer money, authorize a check, obtain cents-off coupons and purchase items from an electronic catalog. The same system would provide the retailer with electronic security, access control and energy management systems for the store.

These self-service applications could double the projected annual ATM transaction levels to 20 billion transactions by 1990. If these assessments are correct, and some experts believe they are conservative, we are rapidly approaching a self-service, transaction-driven society.

This round-the-clock, consumer-operated fuel dispensing system can be activated by debit or credit cards.

GEAR from SR/16

a trial-and-error procedure for the DP department. Fortunately, vendor firms were involved in the process.

Despite the liabilities associated with early DP, user demand for system access steadily grew. Mainframe systems were overloaded as more lines were fed into the system. At the same time, operation and maintenance costs escalated. As work backed up, it became clear that a new configuration was needed between computer and terminals to make DP more cost-efficient.

The temporary solution was the distributed clustering of terminals to the minicomputer. This off-loading of the mainframe meant that not only could current work be done, but also that more users could access the system. As the number of users accessing the system grew, however, the resulting traffic problem produced exorbitant communications line costs and once again overloaded the host system. More complicated applications and higher application costs continued to add to the MIS manager's work load.

A better solution was a flexible synchronous terminal that saved transmission costs by capturing current data from the mainframe or mini and processing it right on the terminal itself.

Synchronous terminals became a cost-effective way to get work done. As more and more nontechnical users sought computer experience, user-friendly technology mushroomed. This development went hand in hand with across-the-board demands for flexible, tailored applications. And, invariably, as soon as a new application was developed by MIS, the local department manager requesting the application found one more task for MIS to fulfill.

The introduction of faster data speeds, multitasking, data integrity, shared data base information and on-line computing further broadened the appeal of new technology. Office automation was well on its way. Today, many local department managers are solely responsible for seeing that the department needs are met.

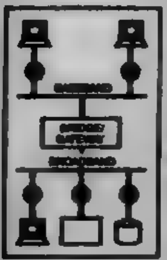
LAN

THE DECISION TO WAIT AND SEE JUST PAID OFF.

Now there is a company that can satisfy your LAN needs both today and ten years from today. A company with flexible solutions backed by over 20 years of networking experience.

Codex.

In the 4000 Series LAN, we offer a system that lets you configure and control the precise mix of LAN technologies that suit your company needs.



A system, for example, that lets you combine a broadband backbone for data, video and voice applications, and less expensive Ethernet baseband feeders to support individual work areas.

A system that supports a wide array of industry standard interfaces. So you can connect practically any vendor's equipment.

Later, when your needs for internetworking and network management expand, those needs can best be met by the company that has literally written the book on adaptive routing, network management, protocol intervention, and statistical multiplexing.

Codex.

We just made the decision to get into local area networking a safe decision to make.

For more information, call 1-800-821-7700, ext. 879. Or write: Codex Corporation, Dept. 707-79, 20 Cabot Boulevard, Mansfield, MA 02048.

FINALLY. HELP FOR THE DATA CRAZED.

Introducing Cypress,® Cedar,™ and Juniper.™ Three fast, friendly, infinitely applicable desktop ideas from ROLM.

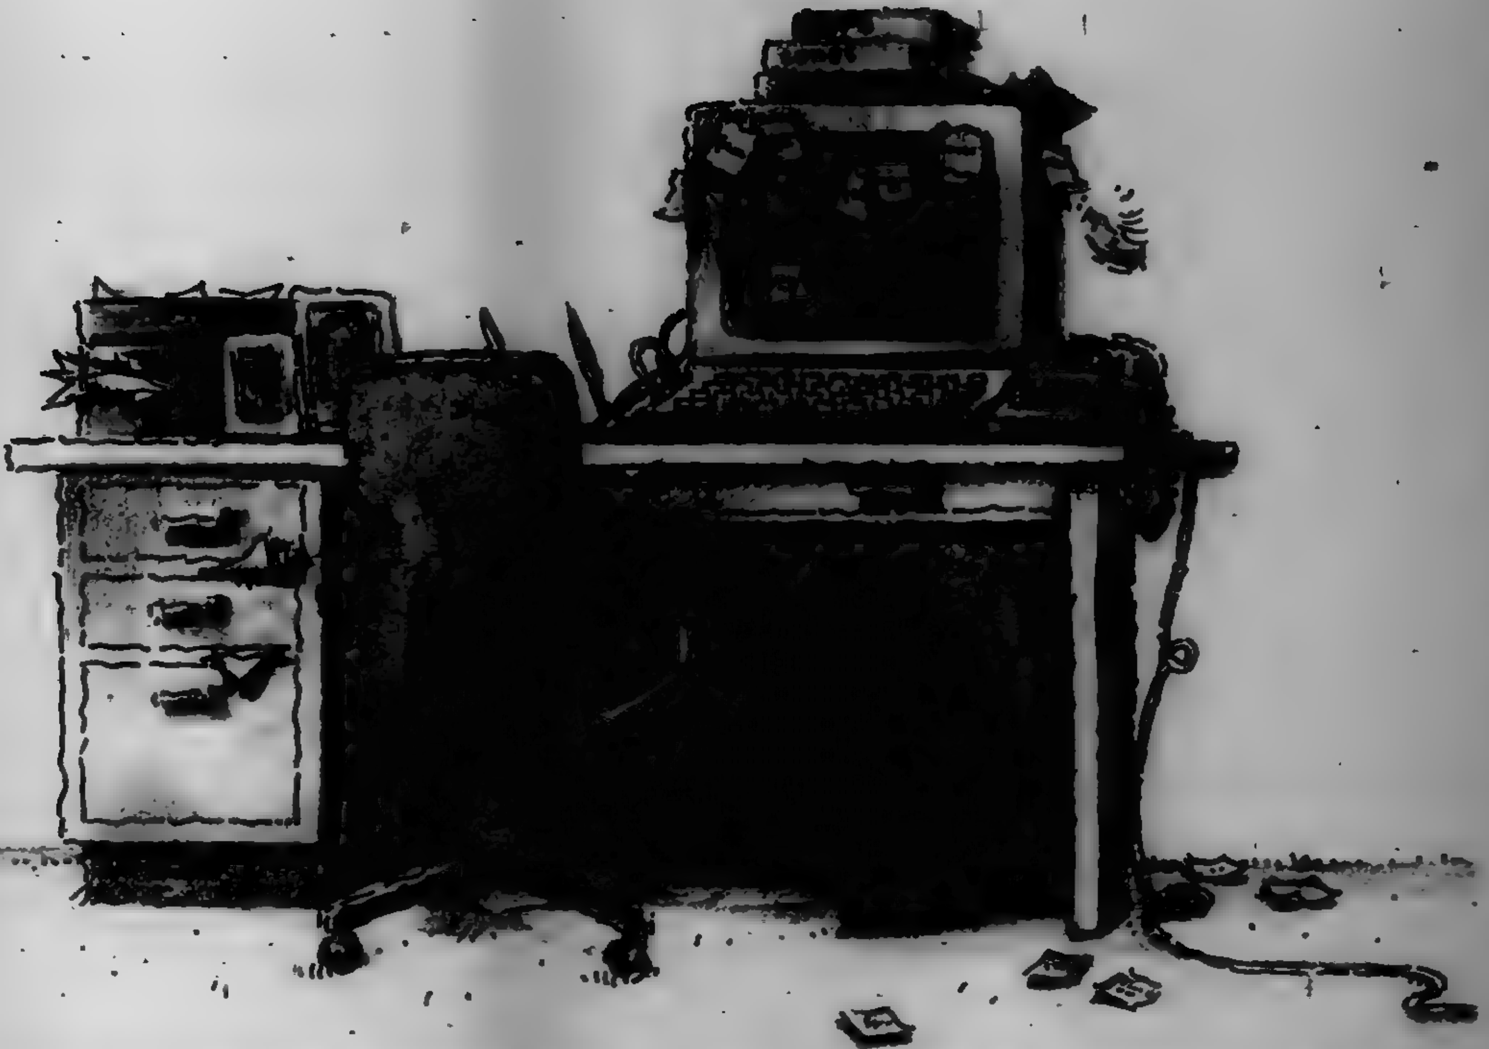
It comes as no surprise that people react to technology differently. Dyed-in-the-chip techies thrive on it. True non-believers avoid it instinctively.

Now you can please all of the people all of the time. Honest.

Say goodbye to complicated log-on codes. Just push a button and—whoosh!—travel all the way to a data base, talk to a mini or access your IBM mainframe.

Say hello to speakerphones, phone books, message takers and calculators. Built right in.

If you want to take snapshots of data in your mainframe, there's Cypress. It's as easy as Point & Shoot. It's a smart little ASCII terminal integrated with a fully-featured digital phone.



Need a 512 KB, fully IBM-compatible PC that runs programs like pfs:graph,™ the IBM Assistant Series,™ 1-2-3,™ and lets you mini-network through your phone line? Cedar's the one.

Already in love with your IBM®PC or XT but crave the affections of Cypress? Ask for Juniper. Its one slot adaptor card lets your system keep growing. And growing.

Of course, only ROLM has Cypress, Cedar and Juniper. Because only ROLM has the system to run them on. At its heart is the CBX II, a breakthrough communications controller that manages voice and data over standard telephone wire. Simply, brilliantly and cost effectively.

And ROLM has the technical edge, the operational track record and the worldwide service and support organization to please even the toughest customer.

So phone ROLM. High tech. Not high anxiety.

Migration path from VDTs key in agency's choice of micros

ALBANY, N.Y. — When users at New York's largest state agency here began asking for personal computing power, their data processing center gave it to them without giving up the advantages of a terminal system that was already installed.

The New York State Department of Mental Hygiene consists of the Office of Mental Health, the Office of Mental Retardation and Developmental Disabilities and the Division of Alcoholism and Alcohol Abuse. It is the largest government employer in New York, with about 70,000 employees, and has an annual budget of more than $2.7 billion.

The data center that oversees operations for the entire department, the Information Support System (ISS), has for two years operated a network of 440 IBM 3270-like terminals — mostly Mohawk Data Sciences Corp. (MDS) 2192s and some other VDTs from Racal-Milgo, Inc., Raytheon Co., Memorex Corp and IBM.

Terminals in the network are controlled by 187 MDS Series 21 distributed processing systems. The network is linked over bisynchronous data lines to an 8M-byte IBM 4341 and a 12M-byte Honeywell, Inc. DPS 8/70.

Agencies within the department use the terminal system to maintain patients' medical histories and to track drugs that are administered, so as to prevent the possibility of adverse interactions.

The department also keeps track, through the mainframe data base, of the $800 million in billings it sends out annually for its health care.

George Syrett, director of technical services and systems operations for ISS, said providing users with access to such mainframe data is crucial. "I don't believe people are islands," he said. "They have to connect."

When users asked for personal computing power, ISS chose MDS Hero networked personal computers over other products, chiefly because the machines could provide a migration path from the current network.

He explained that just about any box can provide desirable personal computing abilities, but that none but the Hero allowed the department a convenient migration path from its terminal system.

ISS installed [illegible] Heroes this spring and plans ultimately to link them and other Heroes it has ordered to the mainframes over private leased data lines and to eliminate the Series 21 controllers. But the switch to the private lines will take about two years, in part because of AT&T's line installation backlog.

"Part of our problem is that we can't get telephone lines, so we can't get a network," Syrett said. ISS is relying on the Series 21 migration path to pull it through the interim.

It is working to tie some of the Heroes into the terminal-mainframe system through the Series 21 controllers. A Zilog, Inc. Z80 chip in the Series 21 switches the Hero's asynchronous transmissions to bisynchronous so the information can travel to the mainframes over data lines.

Mainframe access

"The MDS Hero accesses the mainframes' host computing resources and data bases, allowing users to interrogate the data locally then integrate it into an MDS Hero application," Syrett said. This gives users the freedom of a [personal computer] and the power of the mainframe."

Four Heroes currently access the mainframe as 3270 look-alikes through a drop network. The machines are fitted with emulation software that makes them appear to the IBM and Honeywell mainframes as 3276s.

Until they can be linked to the network through the Series 21s or through the permanent data lines, most of the other machines will serve as stand-alone systems for word processing, for spreadsheets and for evaluating different health programs.

IN HEAD-TO-HEAD COMPETITION, OUR NETLINK BEAT THE TRUNKS OFF EVERY COMPETITOR.

We recently asked a number of data communication users to test our DCA Netlink on-site against any competing product. In every trial, against all comers, Netlink won. With a flurry of hard-hitting features.

The most telling blow: its data-voice-compressed video combination. Netlink can deliver all three simultaneously at various speeds. Via leased lines, microwave, laser, satellite, fiber optics — whatever transmission mode you use.

It can handle speeds of 50 bps to 2.048 million bps and transmit voice at low speeds without losing quality or speech recognition.

Because it's software driven, you can change channel speeds and configurations with the touch of a console. Or you can program it to change configurations at predetermined times.

And because it's an advanced time-division multiplexor, it is completely transparent and compatible with all your voice, image and data communications equipment.

So why not give it a shot. You'll discover as others have that for power, speed and flexibility, the DCA Netlink can't be beat.

For more information, write DCA, 303 Research Drive, Norcross, Georgia 30092. Or call toll-free: 1-800-241-5793.

Wise terminal makers will heed end-user demands

By Allan Maurer
Special to CWS

The times are changing for VDT suppliers. The rapidly maturing end-user market is demanding more than a dumb box and is looking increasingly to multifunctional, interactive desktop devices and personal computers for its data processing and communications needs. The trend is definitely toward smart.

Demand for personal computers and intelligent workstations continues to grow at an astounding rate. An estimated 25.5 million personal computers will have been sold in the U.S. by 1987, according to a prediction by Dataquest, Inc. The demand for conversational and editing terminals is also growing, but much more slowly. Approximately 5.5 million such terminals will be installed by 1988, according to a study by Advanced Resources Development, Inc.

What all this means is an increased demand in the next five years for systems rather than terminals. CRT terminal suppliers will either have to branch out to satisfy workstation needs or become casualties of the inevitable shakeout in the terminals market.

The terminals market is not faltering, however. Personal computers cannot answer all the needs of business systems users. The two factors that will favor the growth of terminal products are cost and the need to disperse information and functions among a number of workers. But it is clear that the market must adapt.

The largest segments of data entry terminals comprise three distinct groups of equipment and represent 63% of the domestic data entry terminal base: Editing CRT terminals (IBM 3270-type compatible) have roughly 24.5% of the overall market; conversational CRT terminals represent about 23% of the market; and editing CRT terminals of the non-IBM 3270 type have about 15.5%. These numbers exclude key-to-storage-oriented units that represent approximately 3% to 4% of the overall data entry market.

A growth rate of 69% is expected in this market by 1988 with growth expected in these three areas:

- 25.9% in 3270-type editing terminals.
- 23.4% in non-3270-type editing terminals.
- 19.2% in conversational terminals (representing a 4% drop in share).

Clearly, the non-3270-type editing terminals will show the strongest growth, with conversational terminals taking a drop.

The increasing use of business graphics points to growth in the graphics terminals market as well. A study by Venture Development Corp., based in Wellesley, Mass., shows a projected 29.9% compound annual growth in dollar shipments of graphics terminals. Inexpensive raster-scan graphics displays will no doubt have the lion's share of the market, provided a high resolution is offered. In the meantime, graphics terminals continue to offer smaller suppliers a means of competing with larger, more established firms.

Some producers of terminals have tried to find a new profit niche for themselves in the personal computer market. The danger, of course, is in entering a market that is chock-full of competition and one that is already dominated by a few of the big guys who leave little room for others The diversion of energies and resources from terminals manufacturing and marketing to computers can be a fatal drain. The workstation and intelligent terminals market represents a more effective course for a terminal producer to take.

Industry studies indicate that by 1988, the market will be dominated by devices designed specifically for workstation functionality — true management workstations. The proliferation of workstations is attributed to several cited trends. Among them is the increasing availability of multifunction, interactive products. The ease with which components can be integrated and interchanged, particularly with the emergence of the [illegible] communications protocol.

Advances in technology have increased performance to such a point that intelligent workstations can now be adapted to virtually any application. Fewer compatibility barriers and emerging standards will make it easier to choose a multiuser system over a personal computer.

An additional factor that cannot be ignored is the new awareness on the part of the end user that these technologies can be useful at all levels of office operations.

This new, aware market will find terminals with local intelligence and graphics attractive. Word processors that are multifunctional and supermicros such as the IBM Personal Computer AT and others have increased the options for communications and expansion. Small systems in particular, with easily integrated components and software supporting a number of users with different needs, should continue to be a significant portion of the multiuser mart.

Maurer is the vice-president/marketing for Esprit Systems, Inc., a manufacturer of graphics and data communication terminals based in Melville, N.Y.

Pay less for more.

VP4801 APT, $348*

Get RCA quality and performance.

OEM designers and systems integrators can now utilize the many performance features of RCA communication terminals, at most attractive prices.

The RCA APT (All-Purpose Terminal).

Professional quality RCA APT terminals are designed for remote data base timesharing and direct computer-connected applications. They feature a built-in 300 baud direct-connect modem, an RS232C interface for high speed modem and other accessories, and a parallel printer port for hard copy. Menu controlled operation and a "programmable personality" can match specific requirements for each data base.

VP4801 APT, $348*

Full 60-key typewriter-style keyboard with 16-key calculator keypad. Auto-dial (tone or pulse) of up to 26 stored numbers for voice or data base calls. Programmable sequences initiated automatically after log-on. Two user keys for selection of printer or other operating modes; four programmable function keys, shiftable for a total of eight functions. APT can be programmed to match the communications requirements and control commands of many other (and more expensive) terminals. Briefcase size (17" × 7" × 2"), light weight (under 6 lbs.) and memory backup (minimum 48 hrs., without batteries) enhance portability. Many other user-friendly features.

VP3801 APT, $348*.

Same features as VP4801, in rugged metal case with flexible membrane keypad, designed for dependable performance in hostile environments.

VP3801 APT, $348*

VP3301 Interactive Data Terminal, $307*.

58-key flexible membrane keyboard with finger positioning overlay includes two definable user keys. Full RS232C interface for direct modem and computer connection. Six switch-selectable baud rates from 110 to 19.2 kilobaud. Full color graphics and reverse video. 40 character × 20 lines or 20 × 12 display formats. Video output for 525-line color or standard monochrome monitor. Size: 13.1" × 7" × 2". Weight: approx. 5 lbs.

VP3301 IDT; $307*

NCR

Rise of automated office accompanied by continued

By C.S. Thachenkary and S.E. Harris
Special to CW

The emergence of the automated office has brought with it a bevy of purported VDT-related ailments and a controversy over VDT health hazards. In a survey conducted by the Data Entry Management Association (Dema) in 1984, over two-thirds of those responding had experienced eye strain, back pain, fatigue and neck/shoulder pain; over one-third reported burning eyes and general irritability.

In West Germany, over one-third of the health insurance costs for women office workers are due to an increased incidence of back- and neck aches. In both the U.S. and Canada, women operators have questioned VDT emmitance of low-level radiation and its possible effect on pregnant women.

In 1983, the Canadian Center for Occupational Health and Safety found that some VDT models leak extremely low-frequency radiation and linked exposure to low-frequency radiation with reproductive defects in laboratory animals. Research in 1982 by Dr. Jose Delgado in Madrid claimed that exposure to extremely weak pulsed magnetic fields, similar to the magnetic field pulses from a VDT's fly-back transformers, caused changes in chicken embryos.

Because the more serious health problems are suspected to be caused by the emittance of low-level radiation, government agencies such as the National Institute of Occupational Safety and Health (Niosh) and the National Academy of Sciences have carried out preliminary studies. A major advocate for closer monitoring and testing of VDTs is 9 to 5, the National Association of Working Women. At this time, significant evidence of VDT links to radiation and health problems has not been established.

While the controversy continues, mounting pressure from employee organizations has prompted close to two dozen states to consider legislation regarding the use of VDTs in offices. Some states, such as Connecticut and Maine, have already passed bills; others are still discussing them.

As legislatures across the nation consider the issues pertaining to the use of VDTs in the workplace, the Computer Business Equipment Manufacturers Association (Cbema) has formed a heavily financed lobbying group that has lobbied against VDT bills in California, New York and Ohio. The bill introduced in California was defeated.

Obviously, management needs and user concerns must be addressed. An ergonomically designed office promotes both user comfort and productivity. The cost of providing ergonomically improved systems can be readily justified in terms of better health and greater productivity of office workers.

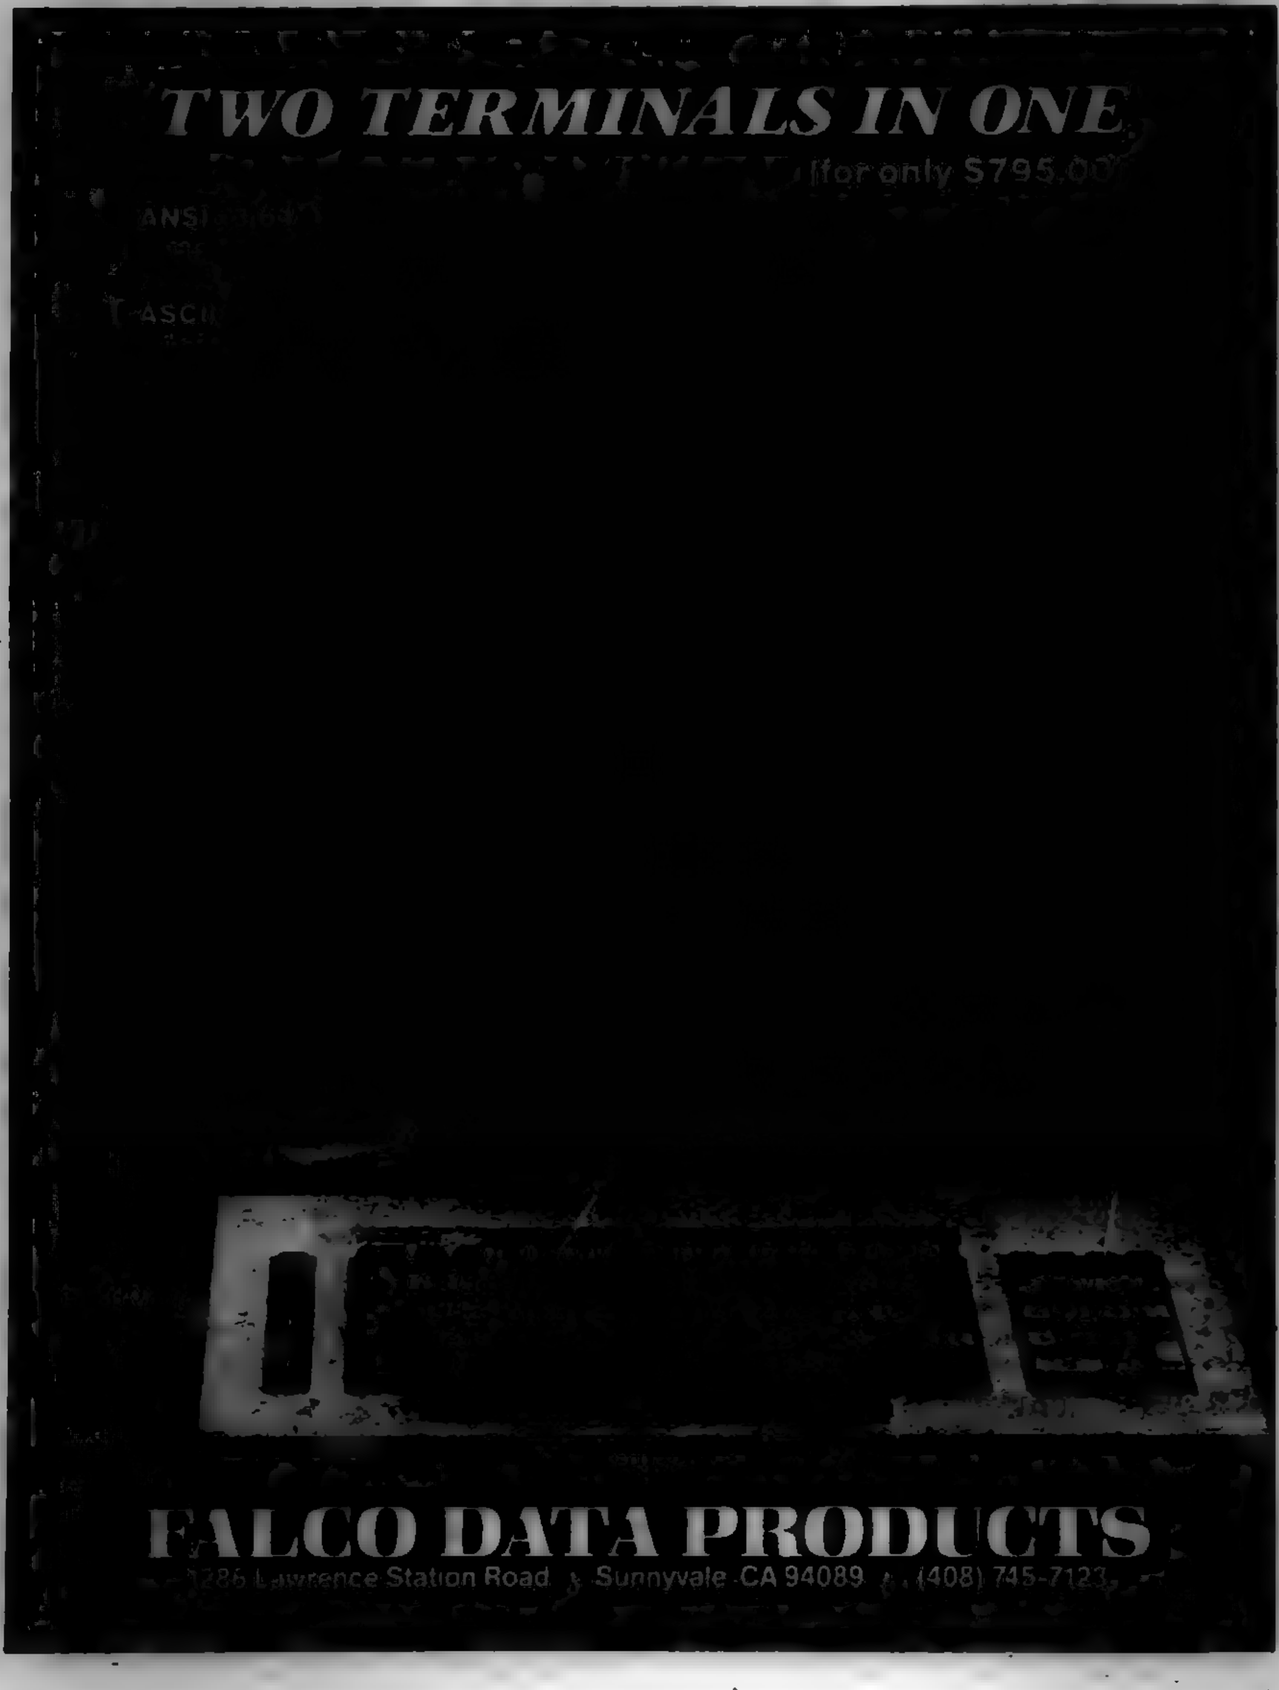
The modern workstation has three principal components: the user, the VDT-based office information center and office and office furniture.

- **The user.** To ensure user comfort and health, be aware of any pre-existing health problems on your staff that might be aggravated by working in an automated office. Encourage periodic physical examinations and health maintenance.
- **The VDT.** Progress is being made in VDT-based office information systems. This includes the advent of detachable keyboards, tilting/swiveling screens with amber or green displays, and screens and keyboards constructed of glare-reducing materials. Detachable and modular components significantly improve a system's ergonomics.

A 1984 study conducted by Niosh found that data entry workers using ergonomi-

---

Thachenkary and Harris are members of the decision sciences faculty in the College of Business Administration at Georgia State University in Atlanta.



debate over possible VDT-related health hazards

cally designed terminals were measurably more productive.

A drawback of the CRT found in today's VDTs is the flicker of the image on the screen. Furthermore, VDT screens display information on a vertical plane. Most people read naturally on a horizontal plane with their necks slighty bent forward. When users are working on a VDT, their necks are forced to be in a straight and upright position. Flickering VDT images and postural stiffness can cause eye irritation and body aches.

Flicker-free images

Recent developments in plasma display technology, for example IBM's 581, make use of neon and argon gas enclosed between thin glass plates to produce stable, flicker-free images. These screens do not emit electromagnetic radiation, and they have the added advantage of being flat panel displays rather than boxy CRTs. They can also be moved easily and are less bulky.

■ The office and office furniture. Office furniture should feature orthopedically designed chairs that provide firm support for the back and allow individual height and seat adjustments. The most radical of such designs is the so-called balance chair, which has no direct back support.

An American Productivity Center survey of large organizations found that improved furniture design can increase productivity by about 12%. Additional payoffs include fewer sick days, better labor-management relations and the reduced potential of litigations and court actions to resolve health complaints. A number of organizations, including TRW, Inc. and the Canadian firm London Life, Inc., have begun to assess the ergonomic soundness of their systems and physical facilities.

The design of an ergonomic environment also includes a comprehensive physical facilities-planning program. This program helps to focus management attention on the problems of acoustics, heating and cooling, lighting, air circulation and the layout of power cables in an ergonomically designed building.

Another trend to watch is that of the so-called intelligent buildings, such as the Citiplace in Hartford, Conn., operated by Building Systems Co., a United Technologies Corp. subsidiary; and the Concourse in Atlanta, managed by MCC Powers and the Landmark Group.

The cost of ergonomically improved systems can be justified in terms of better health and greater productivity of workers.

Intelligent buildings are fully wired office complexes. Their construction includes a complete package of computer and communications facilities, including local-area networks, digital private branch exchanges, a mainframe computer center, satellite antennas and a host of end-user support services such as user training, security and energy control.

Organizations with a high level of OA should consider appointing a chief ergonomics officer. The ergonomics manager, with a background in human factors engineering, man-machine interface, physical facilities planning and environmental psychology, should develop and enforce ergonomic standards throughout the entire corporation.

This new approach to corporate management stresses not only the use of advanced technologies to increase productivity in the office, but also the development of a physical facilities plan that addresses ergonomic issues.

The International Software Market for the world's Software Industry

The Montreal International Software Market (MIM) is the first truly international exhibition and conference exclusively for the world's software trade.

Montreal, Canada June 3, 4, 5, 1985, is the setting for this unprecedented global interaction of software professionals — buyers, sellers, importers, exporters, authors, distributors and volume end-users.

EXHIBITIONS
- Software for micro, mini, mainframes
- Products & related services

CONFERENCES
- Product design & development for export
- Export profitably
- Software & copyright protection

WORKSHOPS
- How to access world markets
- Trading patterns
- Export problems & solutions

POS system keeps bookstore personnel in the know

KNOXVILLE, Tenn. — The bookstore at the University of Tennessee here uses a point-of-sale (POS) terminal system to help it prepare for and survive a quarterly onslaught of students. "Speed and accuracy are essential when nearly 30,000 students hit the bookstore in three or four days to get their books," said Wade D. Meadows, the school's director of bookstores.

> *'We can gather any information we want and report it in virtually any way.'*
> — Wade D. Meadows, director, University of Tennessee Book and Supply Store.

The University of Tennessee Book and Supply Store, which carries 3,800 textbook titles during each scholastic quarter and registered $7.3 million in sales last year, uses a system based on 31 NCR Corp. Model 2152 POS terminals. The system also includes two NCR Model 761 concentrators; a 512K-byte Honeywell, Inc. Level 6 supermini, fitted with Ultimate Corp.'s Ultimate operating system; and Applied Information Systems, Inc.'s Ratex software for bookstores. It has been in place since April 1983.

During the rush of student book buying, the POS terminals allow cashiers to check students out within an average of four minutes, according to William C. McCarter, the bookstore's assistant director and operations manager. In those four minutes, the automated system enables the bookstore to gather data that allows it to monitor its inventory and make informed decisions about what books to order, in what quantity, for the future. Cashiers pass wand readers over book tags that are printed in optical character-recognition type. Information includes the book's price; its 12-digit International Standard Book Number (ISBN), which identifies the book by title and edition; and its sales class, such as whether it is a new, used or reference book. The POS terminals transmit the data to the two Model 761 concentrators, which pass it through an interface and onto a disk of the Honeywell supermini. The bookstore updates its inventory and other records nightly, McCarter said.

From this information, the store's system produces reports that help its two textbook buyers plan future orders. Because the school is on a quarter system, the bookstore must order books four times a year. The longest lead time allowed to the buyers is about 10 weeks before a quarter starts, which McCarter said "does push things a little bit."

Once every quarter, the buyers have the system generate a course history report for their use. The report includes information about textbooks from courses offered during the past 10 quarters. For all courses from those prior quarters, the report lists the estimated enrollment and actual enrollment along with the number of books purchased by students in the class. The buyers use the report and requisition forms provided by the school's academic departments to help predict the number of books a scheduled class will need.

One of the buyers, Mitchell P. Borden Jr., assistant director and textbook manager for the bookstore, said the reports provide him with "the data I need to make intelligent buying decisions — not data just in raw form, but in the format I need."

He said information from the report has allowed the store to reduce its inventory by about 10% and to increase its inventory turnover from six times a year to seven.

Another report, one the system generates daily, gives the bookstore current information about inventory levels. For each title the store stocks, the report subtracts the number of books that the terminals record as having been sold during the day from the number of books the store had in inventory at the beginning of the day. The report also includes information on how many copies of the book have been sold in the month to date and the year to date.

Other information the system generates daily includes:

- An accounts receivable update.
- A record of cash discounts, accounts receivable and proof reports from each terminal, which is used for balancing.
- Buy-back reports.
- Data on use of bank cards and checks.
- Cash over or under and voids, listed for each cash register.
- A sales error report, which lists incorrect, illegible or missing ISBN numbers from the day's sales.

The system also generates reports on demand to monitor credit card transactions, purchases made by check and other variables. "We can gather any information we want and report it in virtually any way," Meadows said. "Consequently, reporting overall is much better than in the past, [as] is cash control."

IBM 3270 Compatible!

Do you use:
ATMS SCRIPT
etc PROF
EMAIL?

Our Model 736
Letter Quality Printer
plugs right in and gives you
automatic selection of cut sheets from two trays without
making any software changes on your present IBM system.

The ISI-736 is plug compatible with the IBM 3287 for on-line printing from your IBM system. It works with all popular word processing packages.

Unlike the IBM 5210, it requires no expensive software changes to the system. Simply plug it in and it feeds cut sheets selectively from two hoppers under program control.

With multiple fonts and separate pitches, it will support most languages. Other features include underscoring and boldface capability.

Call, write or TWX us today!
We sell, lease and service nationally.

To begin work on any production process, a worker must log on to a Honeywell 3305 terminal and key in information about the work he plans to do.

Food lab's work flow monitored by terminals

ALSIP, Ill. — A laboratory here that supplies seasonings and ingredients to the food industry depends on a system of data entry terminals to make sure its many chefs do not spoil the broth (or the pancake mix or meat tenderizer, for that matter).

Griffith Laboratories USA, Inc. is one of the world's largest suppliers of seasonings and food ingredients. At its manufacturing plants here and in Union, N.J., Union City, Calif., and Lithonia, Ga., Griffith produces about 15,000 different seasonings and ingredients for 8,000 commercial processed food manufacturers, distributors, restaurants and institutions. It has 38 recipes for barbecued potato chip seasonings alone.

About 600 employees at the four manufacturing plants produce the ingredients, and a shop floor data collection system, the Factory Management System (FMS) from Honeywell, Inc., coordinates the employees' work through every step of production.

The FMS at each manufacturing plant consists of:

- A 1M-byte Honeywell DPS 6 minicomputer.
- Ten Honeywell 3305 terminals that guide employees through the production process.
- Twelve Honeywell 7200 CRT terminals used for data entry and work-in-process inquiries.
- Two Honeywell 3301 terminals that monitor employee attendance.
- Honeywell's FMS software, which runs the different terminals in the system.

To begin work at any stage in the production process, an employee must log on to a Honeywell 3305 data collection terminal and key in his intentions. FMS keeps track of each stage, so if an employee tells the terminal he wants to perform work that has already been completed or perform a step out of order, the system advises him against it.

According to Robert Brunson, Griffith's MIS director, "One particularly helpful aspect of FMS is that it helps avoid conflicting labor reports, and it tracks job progress according to our preset standards."

When employees in Griffith's customer service department receive an order from a customer, they enter information about the order into the DPS 6 via one of the 7200 terminals. The mini produces documents, such as recipes, to guide production work. A production scheduler receives these documents, and he schedules production work at the manufacturing plant. Most orders go into production within three days after they are received, Brunson said.

At the manufacturing plants, each order follows a production process that has seven set stages:

- Staging. Employees gather standard-size packages of ingredients from warehouses for use in the recipe.
- Batching. Employees gather the remainder of an ingredient called for in the recipe.
- Mixing. Employees follow the recipe to put the correct amount of ingredients into a mixer at specified times.
- Quality testing. A sample of the product is sent to Griffith's laboratory, where it is tested against the client's standards.
- Dumping. The mixture is unloaded from the mixer and loaded into bulk containers or sent via conveyor belt to the packaging department for division into smaller containers.
- Packing. The mixture is packaged according to customer specifications.
- Weighing. Each case of the product passes over a scale, and cases that do not pass muster are pulled from shipment until their weight is corrected.

Employees key information into the shop floor system via their 3305 terminals to signal the beginning and end of each task within each production stage, and the information is recorded on the minicomputer. When customers call to check on work in progress, customer service employees make inquiries through their 7200 terminals and provide up-to-the-minute reports, Brunson said.

He said the system also keeps track of the time employees take to finish each task, and customers' bills reflect the amount of time it takes the firm to process an order from beginning to end.

Employee attendance data is recorded on the system through the 3301 terminals. Whenever an employee enters or leaves the manufacturing plant, he must insert a punch card — bearing his employee number — into one of the 3301s. The machines read the employee number and time of entry or exit and register the data on the DPS 6. Griffith uses the information to process its payroll and to keep track of employees' sick days.

The firm transmits information daily from the DPS 6 over Wats lines, through a Honeywell Datanet 8 front-end processor and into a 3M-byte DPS 7/55 mainframe at headquarters here. Brunson said Griffith's management uses information from the shop floor data collection system to help it measure production.

The firm plans to integrate the shop floor system into an overall manufacturing resource planning system within two years, according to Brunson. The system Griffith envisions will provide resource management from the time the firm orders raw materials through the time it ships a finished order to a customer.

Fiber optics offers prudent alternative to EIA choices

Communications speed, distances increased without degrading signal quality

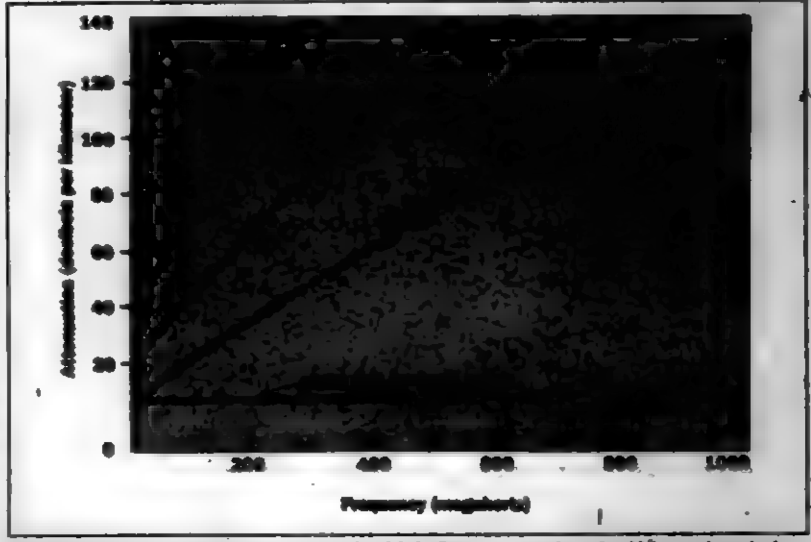
By James B. Bartula
Special to CW

With the advent of fiber-optic communications in the computer industry, managers are now faced with choosing between fiber-optic VDTs, communications boards and cables and their more traditional Electronic Industries Association (EIA) counterparts.

The advantage of using fiber-optics hardware and cables is the increased distance from one communications point (such as a VDT) to another (such as a host computer) that they provide. The need for many short-haul modems is eliminated when fiber optics is used. Current fiber-optic VDTs can be located 1,000 meters or 3,280 feet from a host without the need for short-haul modems.

Another advantage of fiber optics is the speed that light pulses can travel through a fiber cable. Fiber-optic products can communicate at top speeds from 19,200 to 38,400 bit/sec over a 1,000-meter fiber-optic cable. This can be contrasted with the 1,200 bit/sec speed for a 914-meter EIA RS-232C cable, which is the maximum length of cable allowed by the Texas Instruments, Inc. EIA Distance Policy (see story below).

Light is divided into different frequencies. When light is passed though a prism, each frequency emits its own color varying from red to violet. Each light frequency or color is several orders of magnitude higher than the highest frequencies that are now used in the copper wires of computer communications. The higher a given frequency of light, the more information that frequency can carry. For example, a single 125-micron diameter (about the size of a human hair) fiber-optic cable can carry the same amount of information as 900 pairs of copper wires.



High data transmission rates require high-frequency signals. When signals between VDTs and their host computers are carried through copper cables like RG-58/U, 59/U, 62/U, 14/U and 19/U, the signals suffer increased degradation as frequency increases.

As the distance from a VDT to a host computer increases, the signal carried by copper wires is degraded. This signal degradation or "attenuation" occurs because copper wires offer resistance to the flow of the electrical signals they carry. Also, attenuation in copper wires increases as the frequencies going through them increase (See figure 1). Because faster data rates require higher frequencies to carry additional information, these faster data rates result in a high attenuation. This characteristic of copper wires makes them difficult to use in high-speed, long-distance communications.

In contrast to copper wires, the attenuation of fiber-optic cables remains flat as the frequency of the light going through them increases.

Fiber-optic cable with less than one decibel (a decibel is a measurement of loss) of attenuation per kilometer is now available. It is the ability to carry high frequencies with low attenuation and more data at faster data rates over longer distances.

Another advantage of fiber optics is that is it dielectric; it does not emit electromagnetic energy. Fiber-optic cables do not require special shielding to comply with the Federal Communication Commission's electromagnetic interference regulations.

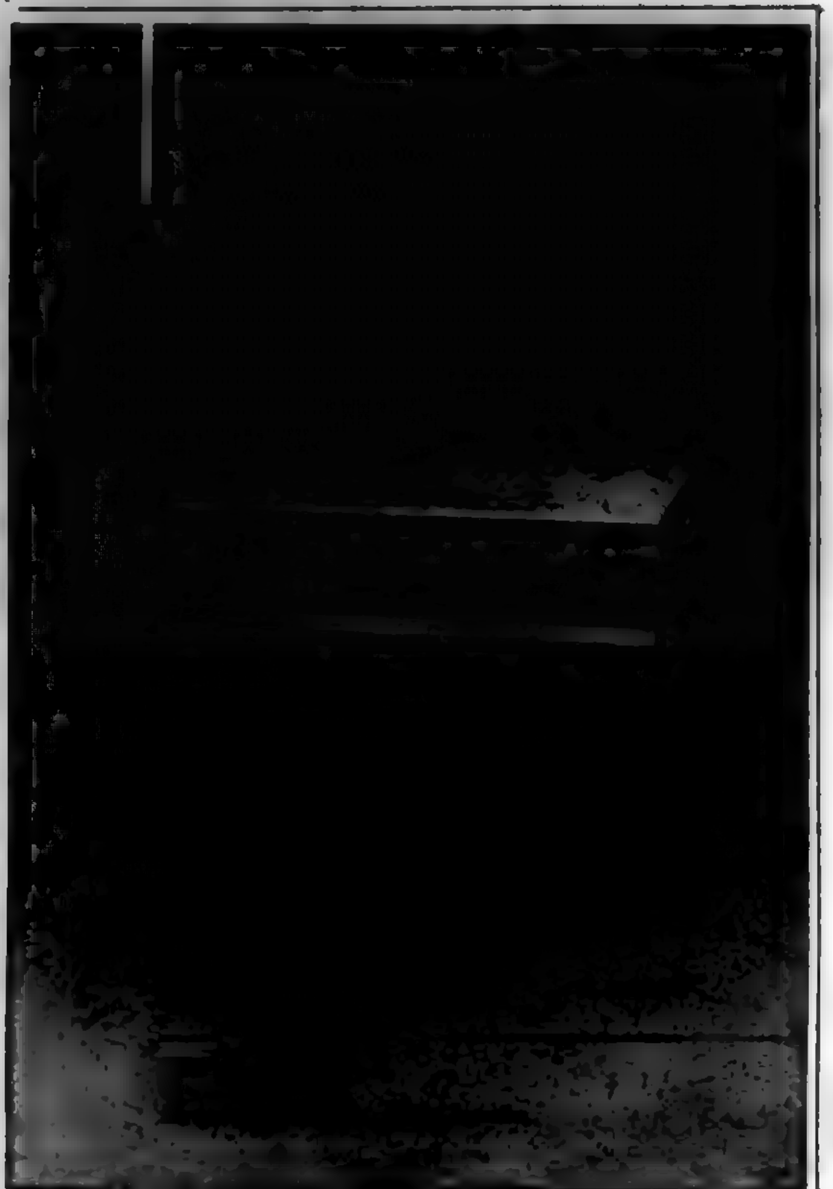
Its dielectric properties make fiber optics suited for use in electrically "noisy" environments. Copper wires can pick up electrical energy emitted by machinery in a noisy environment, transmit it to a host computer or VDT and thus cause malfunctions.

Additional advantages of fiber optics include:

- Increased data communications security: It is almost impossible to tap into fiber-optic communications without affecting the transmission enough to be detectable.
- Space constraints. Fiber-optic cable is smaller and lighter than copper cable.
- Fiber-optic products are safer from electrostatic discharges or electrical storms.

Fiber optics has made its debut in the computer industry. Its advantages will lead many computer users to consider and select fiber-optic equipment.

Bartula is a Product Manager for business system computers with the Data Systems Group of Texas Instruments, Inc. in Austin, Texas.

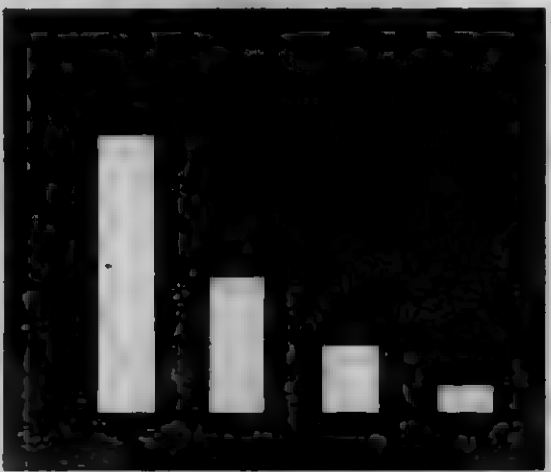


Cable distances for TI products

Texas Instruments, Inc's. Electronic Industries Association (EIA) Distance Policy states recommended distances between terminals and printers and their host when EIA RS-232C cable is used. TI sanctions operations at distances up to 15 meters, but does not guarantee error-free operation beyond that distance.

The table to the right lists the maximum lengths of EIA RS-232C cable and the associated maximum speed that is used with TI products. To operate at maximum distances, end users must meet restrictions on the types of data equipment used, electrical environment, cable construction and cable wiring.

The table shows that the maximum EIA RS-232C cable length is 914 meters, but this distance can only be attained when using a communications speed of 1,200 bit/ sec. The fastest speed available over EIA RS-232C cable is 9,600 bit/sec; this speed can only be attained at a maximum distance of 122 meters.



The maximum speed at which terminals and their hosts can communicate over TI's EIA RS-232C cable decreases as the distance between the machines increases.

Investment in ergonomics can pay healthy dividends

By Robert L. Barcus
Special to CW

Office ergonomics can affect productivity and profits as well as employee morale, safety and health. The National Institute of Occupational Safety and Health reported that an ergonomically sound automated workstation can boost productivity by more than 20%.

The expansion of computer technology into every facet of office activity has dramatically changed the character of today's office. Local-area networking and word processing, for example, have made marked improvements in office output. The human factor in office automation, however, was neglected in the rush to automate the workplace. As a result, complaints of eye- and back strain and questions of radiation-related pregnancy and eye complications have cost U.S. businesses millions of dollars (see story SR/26).

Many corporations now carefully evaluate their seating, lighting, computer-support furniture, acoustics and wire management systems to ensure that new and existing OA installations are ergonomically sound as well as cost-efficient and profit-boosting. The following topics should be considered when designing an ergonomically sound office environment.

■ Seating is a primary concern for worker comfort. Offices should be equipped with chairs that fit user, not designer, specifications. Chairs should be adjustable at the seat and back to fit the user and provide proper lumbar support. Furthermore, a chair's design should reduce pressure on the arms and upper legs and behind the knees. A properly fitting chair and regular rest breaks away from the workstation (some industry groups suggest 15 minutes every two hours) are effective ways to reduce back strain and provide greater comfort.

■ Computer support furniture, such as tables and desks, should be another management concern when designing an ergonomically sound office. Tables and desks should be adjustable. In addition, tables that support VDTs should include mechanisms, such as a cantilever, for altering the work surface and the keyboard shelf positions.

Currently, retractable articulating keyboard shelves are popular with occasional computer users. These devices support the computer keyboard and can be adjusted both vertically and horizontally. When the computer is not being used, the shelf retracts and rests under the work surface. Unfortunately, many of these shelves protrude four to seven inches below the work surface, restricting leg movement. The best option in a keyboard shelf is one that retracts, then swivels to a 90-degree angle below the work surface, freeing the legs to move as needed.

■ Lighting and acoustics play a major role in worker comfort. Poor lighting can cause eye strain, which can lead to headaches and dizziness. One way to cut down on eye strain is to select terminal screens that tilt and to outfit the screens with glare-reducing filters and hoods. Also, consider the light source. Lights should be positioned so that they are neither directly behind nor directly above the seated worker.

Ambient lights are one way to provide low-glare lighting. Ambient lights reflect light off the ceiling, creating an umbrella effect of softer light, which reduces glare and shadow. Ambient lighting offers other benefits as well. Because they are not necessarily stationary, these lights can often be moved to accommodate a new office layout. In addition, because, for tax purposes, these lights are recognized as furniture, their amortization schedule is attractive.

> *The most reliable method of determining if your staff is comfortable in the automated office is to ask them.*

One cost-efficient solution to lighting problems in an open-plan office is to use properly designed ceiling fixtures supplemented by panel-hung task lights. Task lights also brighten shadowy work surfaces.

■ Excessive noise can affect worker productivity. One way to reduce noise in this situation is to use wider, 3½-in. thick, sound-absorbing divider panels and situate furniture and lighting fixtures to reflect and dissipate sound.

■ Wide panels also increase an office's wire management options. Increased panel widths have a greater capacity for both designated and dedicated power lines at the base of

Device upkeep maximizes benefits, minimizes costs

By Steve Aaron
Special to CW

To maintain terminals, companies must establish basic preventive maintenance procedures that can be easily executed by terminal operators.

Whether a company has 200 terminals or a single user, the benefits of good service and proper terminal maintenance means maximized uptime and cost-effective servicing.

Technological advances and the increased user dependence on computer systems has changed the way terminals are maintained and serviced. Ten years ago, terminals were periodically overhauled. Today's improved manufacturing standards and advanced electronics have made the scheduling of major and lengthy maintenance obsolete. Terminals in use today require more preventive maintenance and vendor support.

Many vendors have reacted to this need by including service options as an integral part of their selling packages. Service organizations, which share the maintenance responsibilities with the operator, are also more prevalent.

To help maintain a network of terminals, companies must establish basic preventive maintenance procedures that can be easily executed by terminal operators. In addition, they must select an equipment service contract that will meet all maintenance contingencies.

The investment of time needed to become versed in the simple preventive maintenance procedures outlined here will pay significant dividends in the form of optimal performance and uptime. The first step to take is the proper installation of terminals and customer training for those who will use them. Most computer failures occur during the first 90 days after an installation, oftentimes because of users' unfamiliarity with the system. Computer terminals are increasingly complex, and customer training helps to prevent downtime.

During training, a good service technician will explain the procedures and precautions operators must take. A good operator will take the time to listen and ask questions.

Operator's manuals are a good source of information for users. When reading, users should pay close attention to key parameters, including bit/sec rate, parity and duplex. This information should be kept handy, as it can serve as a quick reference for the basic operation of the equipment. The information is particularly helpful if the terminals are part of a shared system.

No training program is complete without a mention of the habits that can jeopardize electronic equipment. Although terminals, printers and electronic typewriters should be kept clean, care should be taken. Standard commercial cleaners can be used on most equipment, but spills will short out the unit. Similarly, placing a coffee cup on top of a terminal is a risk. Spills are referred to as "abuse" in most maintenance agreements.

In addition to spills, dropped staples, paper clips and other desktop paraphernalia can also damage a keyboard by shorting the circuit cards beneath the keys. Symptoms of this abuse include repeating characters or sticky keys.

Excessive heat can also cause terminals and other electronic equipment to malfunction. For this reason, air vents in CRT terminals and printer covers should not be blocked. Blocked air vents can cause a terminal to overheat, increasing the chances of failure. For the same reason, a terminal should not be placed in direct sunlight.

Another factor that can play a part in a terminal's possible malfunction is the use of improper cabling and electrical outlets. Plugging terminals into ungrounded extension cords is dangerous. These ungrounded cords can cause imperceptible shorts and related problems such as glitches and garble.

Environmental conditions also affect the performance of terminals and printers. Humidity, smoke and dust can impede the smooth operation of the terminal. Micros are especially sensitive to these elements.

A capable service technician can easily pinpoint and correct many problems over the telephone. The key here is patience. If you must make a service call, explain the problem to the technician and let him ask questions. Questions such as "Did you plug in the system?" or "Have you flicked the 'on' switch?" may sound

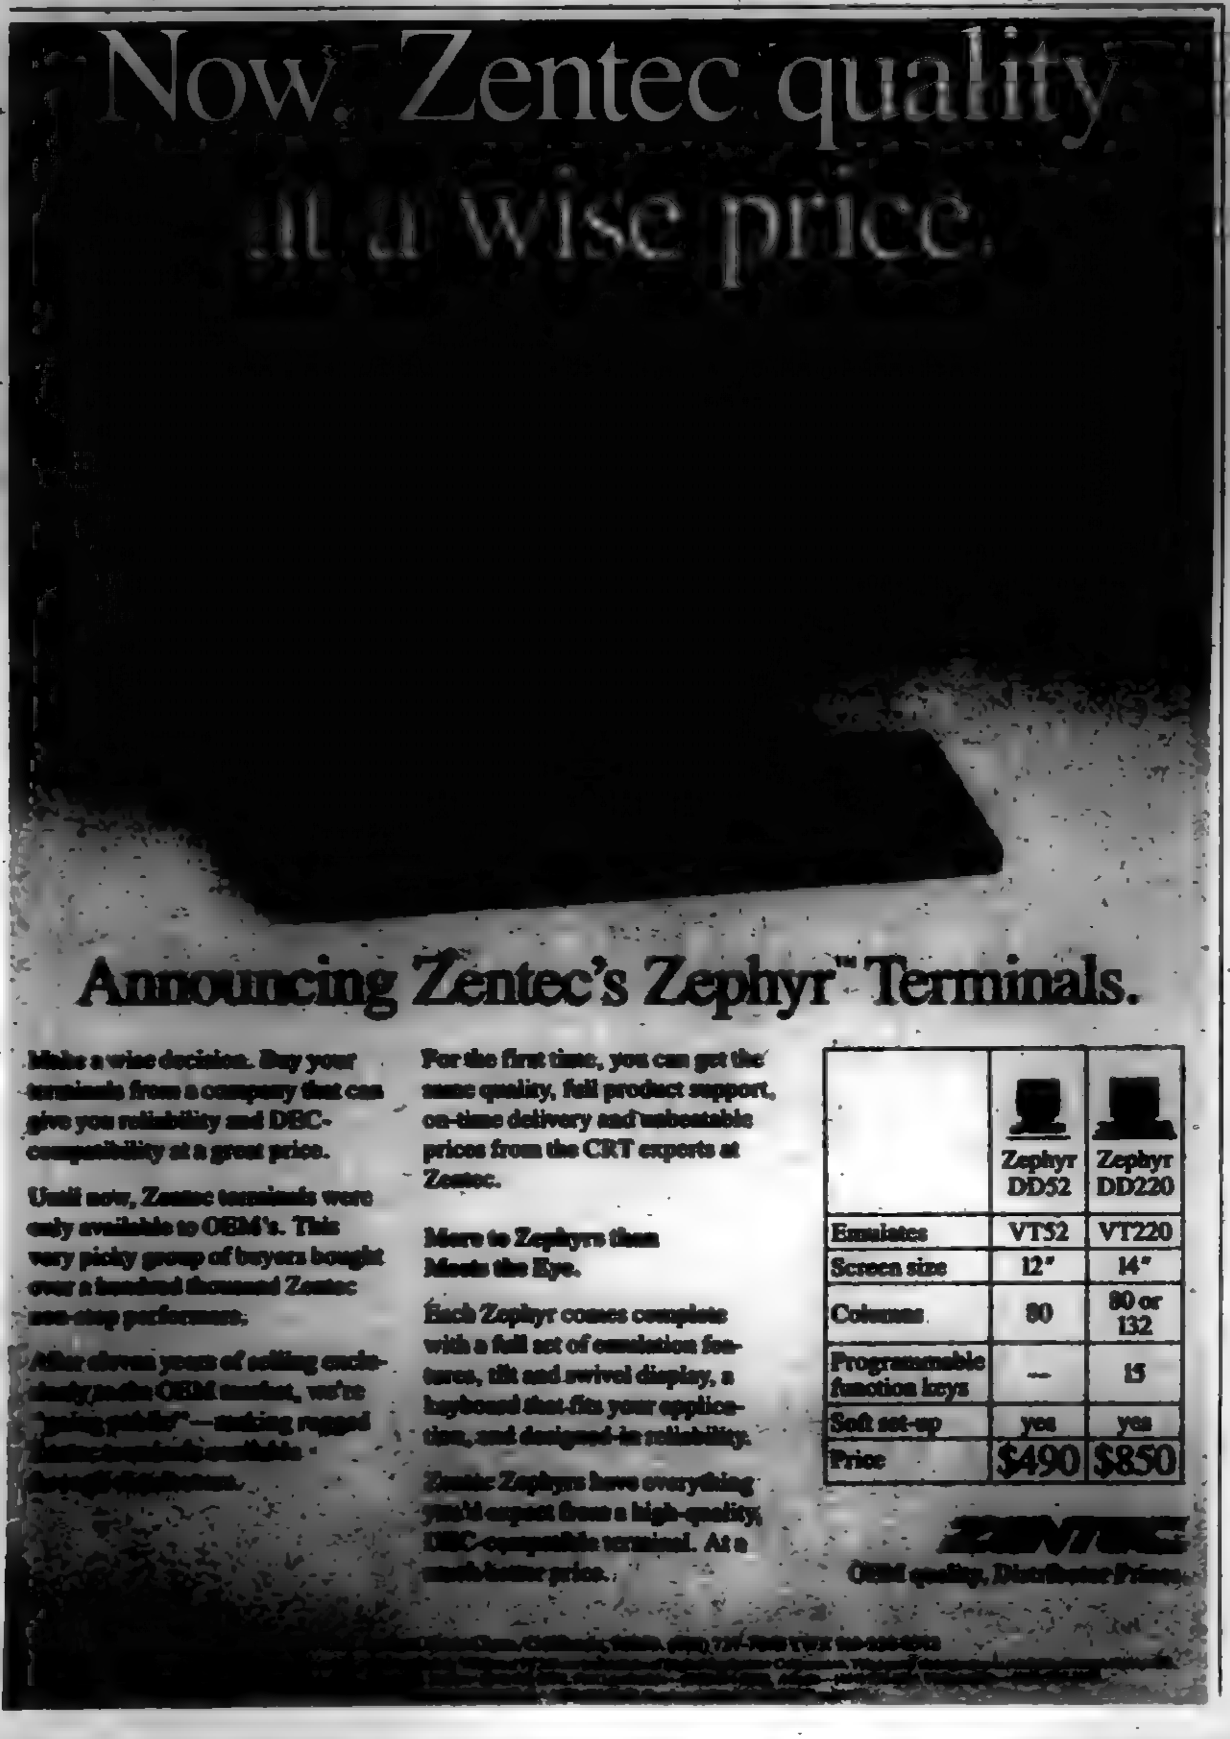
Aaron is a national field service manager for Data Access Systems, Inc., a Blackwood, N.Y., distributor of terminals, personal computers and peripherals with service, leasing and supply capabilities.



Now. Zentec quality at a wise price.

Announcing Zentec's Zephyr™ Terminals.

Make a wise decision. Buy your terminals from a company that can give you reliability and DEC-compatibility at a great price.

Until now, Zentec terminals were only available to OEM's. This very picky group of buyers bought over a hundred thousand Zentec non-stop performers.

After eleven years of selling exclusively in the OEM market, we're "going public"—making rugged Zentec terminals available through distributors.

For the first time, you can get the same quality, full product support, on-time delivery and unbeatable prices from the CRT experts at Zentec.

More to Zephyrs than Meets the Eye.

Each Zephyr comes complete with a full set of emulation features, tilt and swivel display, a keyboard that fits your application, and designed-in reliability.

Zentec Zephyrs have everything you'd expect from a high-quality, DEC-compatible terminal. At a much lower price.

Computer security demands more than Bushido.

The legendary samurai warrior of feudal Japan represented the state-of-the-art in information security. And Bushido, which was his code of honor, placed duty above life itself.

But 20th century management demands something significantly more effective. It demands advanced technology and practical know-how.

The experts at Total Assets Protection have helped hundreds of corporations around the world maximize the security measures protecting their information assets—information that is critical to the continued profitability or existence of any business.

We can evaluate your company's information security vulnerabilities, recommend cost-effective solutions and develop an ongoing information security program. Additionally we can implement important technical and procedural countermeasures such as security software, cryptographic subsystems and security awareness training, to name but a few.

But information security is only part of the job Total Assets Protection can do for you. We're also an industry pioneer and the leader in physical security, designing and building secure computer centers, risk analysis and disaster recovery planning.

If the consulting firm or in-house staff specialist you're considering doesn't have our unique expertise, call us today.

The computer security specialists.

Scholar praises electronic fellow

Vartanian uses his Total Talk terminal to prepare class work and to compose his personal correspondence.

SAN DIEGO — A blind scholar of American thought who teaches at San Diego State University here has great esteem for a colleague he calls "the fellow," even though this fellow speaks not with learned authority, but with a Swedish accent.

"The fellow" is one of two talking computer terminals that Pershing Vartanian uses to help him write correspondence, course outlines, exams, article drafts and manuscript summaries. Vartanian types information into the machines using a standard keyboard. The terminals then read back the information word by word, line by line or a screen at a time, depending on instructions Vartanian enters on the computer terminal's numeric keypad.

The machines, Total Talk terminals from Maryland Computer Services (MCS), are Hewlett-Packard Co. 125s fitted with speech synthesis boards, speech control panels and software that allows them to turn any group of characters into a spoken word. Vartanian uses one Total Talk machine at home as a standalone workstation and another at San Diego State as a terminal that accesses the school's three mainframes.

Vartanian said the terminals' ability to read back prose he has written allows him to regain the control over his writing that he enjoyed before he lost his sight. "The MCS equipment is a built-in pair of eyes that I can use for immediate response," he said.

Vartanian had prided himself on his scholarly writing, but could not carry it out alone after he went blind. "I had to rely on others to help me," he said. "For a writer like myself, it was an aggravating intrusion on a very personal experience."

Vartanian lost his sight through a degenerative disease called retinitis pigmentosa in 1958, when he was 26 years old. He had been working as a high school teacher and continued to teach for three years. Assistants helped him type class material, correct papers and perform tasks he was no longer able to handle alone.

During the summers, he studied toward a master's degree at Columbia University. As he composed his thesis for the degree, a treatise called "The Puritan Symbol in American Thought," his handicap intruded on his work.

"Most of the time I had to rely on an assistant," he said. When he worked alone, he left scrambled notes for his typist and hoped the typist could decipher what he had written. "It wasn't the most efficient or pleasant way to write a thesis, to say the least," he said.

In 1968, Vartanian began work as an assistant professor of history at San Diego State and was completing work on his Ph.D. in American history from the University of Michigan. He grew increasingly frustrated at his dependence on others for help in his scholarly pursuits.

In 1980, he began looking for a tool to help him regain independence. "By then I had been teaching at the college level for about 15 years and was more than ready for a talking computer," he said.

He called MCS' president and explained his needs. "I told him I wanted the machine to be able to spell a word on demand, to speak one word at a time, a line at a time and a page at a time," he said.

Vartanian said Total Talk met his specifications, and he purchased his first terminal shortly afterwards. He later traded that terminal for the one he now calls "the fellow," an upgraded version called Total Talk II, which he uses at home to perform about 80% of his work.

In his office at the university, Vartanian works on another Total Talk, which the school purchased for his use. The machine has access, via a modem, to the school's three mainframes, a Control Data Corp. Cyber 170/150, a Digital Equipment Corp. VAX-11/780 and a DEC PDP-11/45. The school has a second Total Talk in its handicapped student center.

Vartanian said that some blind people have difficulty adjusting to the machines because they have relied on braille and other tactile aids throughout their lives. "But for me," he added, "[the terminals] relieved a lot of frustration and anger that I had built up in regard to writing and independence."

He is currently using the machines to help him compose a book that traces the trend toward specialization in American education and the reaction against that trend.

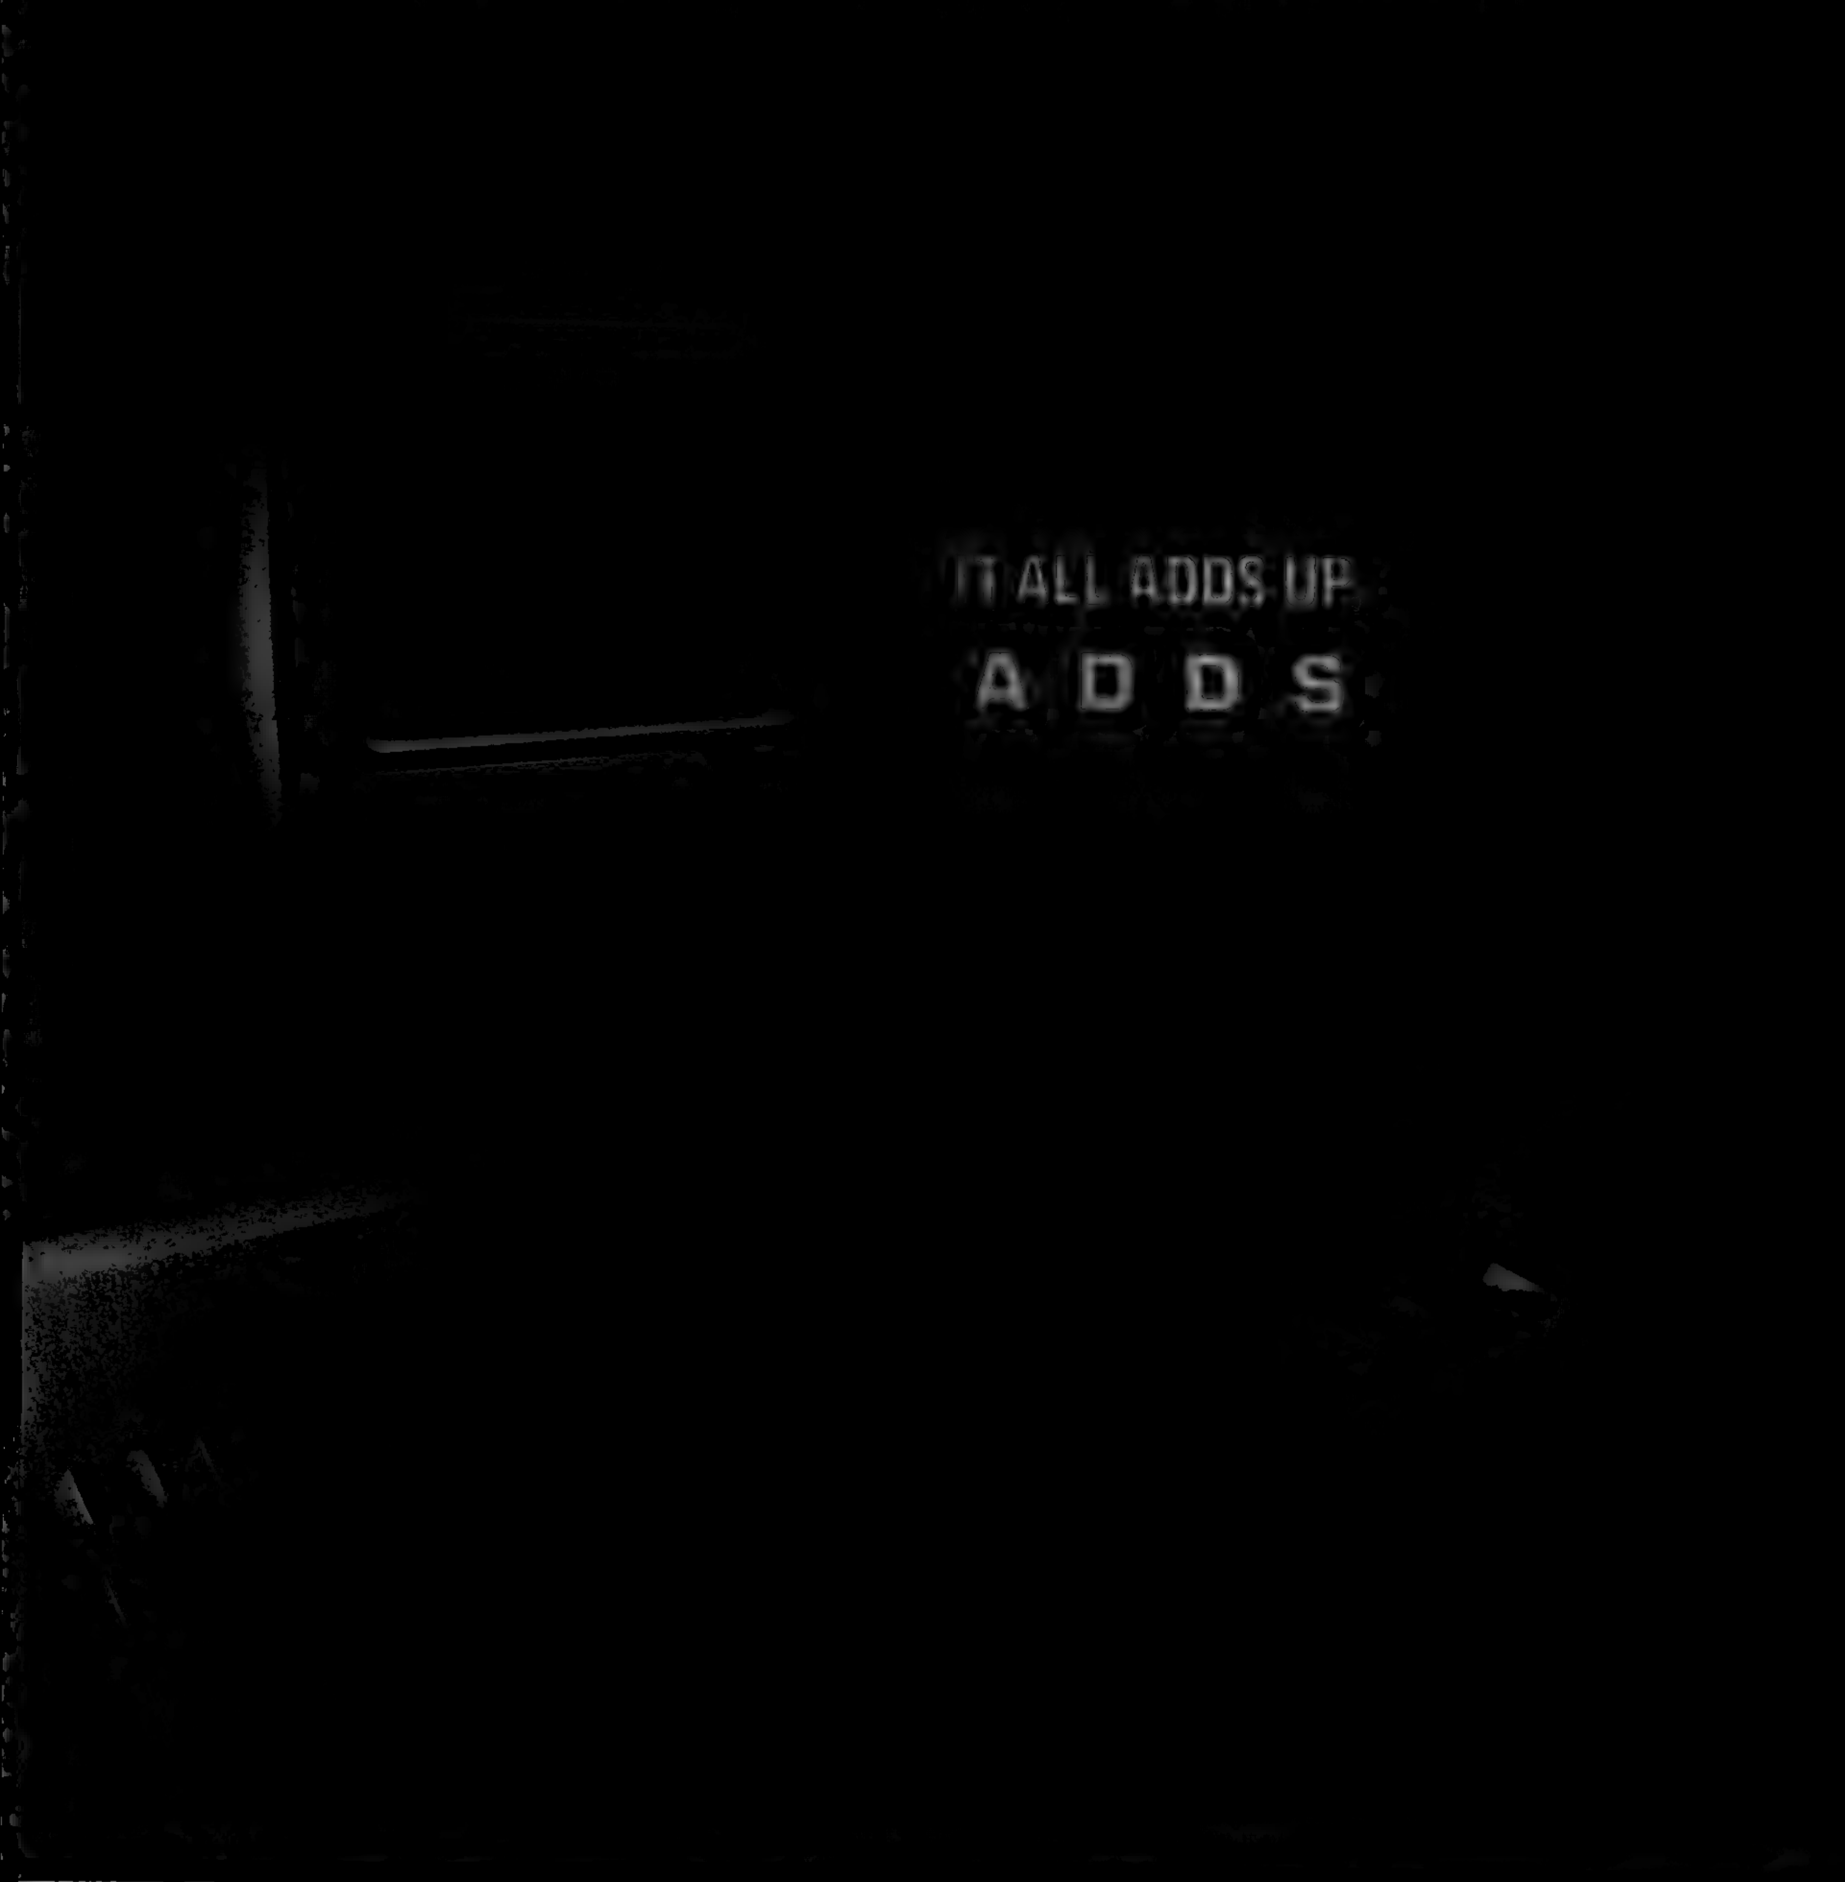
RELIABILITY RUNS IN OUR FAMILY.



SERVICE from SR/34

simplistic, but these points are sometimes easily overlooked. Data Access Systems, Inc.'s service division has found that 10% of their service calls are attributed to these oversights.

Prevent unnecessary service calls

To save the expense of unnecessary service visits, make sure terminal operators check with the systems operator before calling a service technician. Often what is perceived as an individual terminal problem can actually be an entire system failure or a temporary shutdown.

There are many forms of service contracts to satisfy different end-user needs. When considering the purchase of a service contract, ask the vendor or manufacturer these questions:

- Do they have their own service technicians?
- Do they offer a 90-day warranty, preferably on-site with complete vendor responsibility for problems during this period?
- What facilities does the manufacturer or vendor have?
- Does the service organization have a center for refurbishing circuit cards and terminals?
- Does it have a central dispatch toll-free number?
- Does it have national coverage with service centers in key metropolitan areas? Do the local centers offer walk-in service to avoid technician travel time and expense?

Service agreements are available in the following forms:

- Maintenance contract. This type of policy provides one-year, on-site maintenance; the prepaid fee is typically based upon the price of the unit.
- Return-to-depot contract. This contract is considerably less expensive than the maintenance contract because repair work is done at a service center. While the unit is in for repair, better service vendors do light, preventive maintenance such as clean the keyboard.
- Time and material. Some computer terminal owners are willing to risk having no service coverage; when a unit fails, they call for on-site service and pay a portal-to-portal rate on an hourly basis as well as the price of a part, if a new part is indicated. An alternative would be to deliver a failing unit to a service center; the charge is based on actual time and material necessary to repair the unit with no travel time charges.
- In-house servicing. Some companies find it cost-effective to establish internal service capabilities. These are typically large companies with a great number of computer terminals. Today's simpler and smaller units require no more effort than to replace a defective board with a new board at an exchange rate.

A careful analysis of the capabilities and services offered by a manufacturer or vendor is well worth the effort. At the very least, a service organization should have appropriate and ample facilities manned by capable service technicians. A 90-day warranty, preferably for on-site service with the vendor assuming complete responsibility for problems during this period, might be considered standard.

The ideal service package will also include a center for refurbishing circuit cards and terminals, a central dispatch toll-free number and national coverage with service centers in key metropolitan areas that offer walk-in services.

If your vendor or manufacturer offers most or all of these capabilities and services, and your operators develop a habit of preventive maintenance, you can be assured that your computer terminals will provide the performance they were designed to give.

HEALTH from SR/33

the system. Some open office panel systems are internally wired, bringing electrical outlets to the actual work surface. By internally routing computer wires and cables, lines running down the exterior of the panel, as well as tombstones (floor-mounted electrical outlets that limit rearrangment of the office layout) are eliminated.

Flat wiring

Flat wiring is an inexpensive and concealable means of managing the various wires and cables needed in an automated, conventional office environment — one furnished with stand-alone desks. Here, flat wires are run along the floor, under the carpet, to deliver electrical support where needed. These wires are rerouted by taking up the carpet. Many offices now use removable carpet tiles, which makes rerouting, if needed, easier.

Although focusing on the physical characteristics of the office will undoubtably improve its ergonomic fitness, the most reliable method of determining if your staff is comfortable in the automated office is to ask them. Find out if glare is a problem. Ask if desks and tables are appropriately fitted, and try alternatives if necessary. If possible, arrange for a prepurchase trial period to test the computer equipment under consideration.

The National Office Products Association 1983 survey on "The Future of the Office Furniture Industry" reported that personnel expenses now account for approximately 40% of the total cost of doing business. Expenditures for furniture and equipment consumed only an estimated 1% of the total.

It is essential, therefore, that personnel are comfortable with office automation and that investments in computer upgrades do not drive away valued employees. While the computer vendor will have a replacement on the shelf, the available labor pool may not be so bountiful.

And we found it represented in a piece of Americana: The Flexible Flyer.®

It says a lot about how we approach leasing. We're flexible. Dependable. Solid. Part of The Equitable Life Assurance Society of the United States, with over $50 billion in assets under management.

You'll get quick, customized service. We know that everyone has special needs. We act responsibly and responsively.

Like the Flexible Flyer, we do our best to smooth out the bumps.

So when you want to lease state-of-the-art technology from a state-of-the-art leasing company, just call 1-800-854-1074 from 9-5 Pacific time any weekday. (From California, call 619-458-4400.) Our operators will notify our nearest office to contact you. And we'll eliminate the tough sledding.

IBM PC Workstation-$1595.00

Santa Clara Systems makes your investment in the IBM PC, PC XT or PC AT look even better.

Now, everyone in the office can afford to have an IBM PC at their fingertips. Without buying additional computers, and for a fraction of their cost. Only $1595.

The Santa Clara Systems PCterminal, complete with keyboard and monitor, easily connects to any existing PC, PC XT or PC AT allowing you to share the data and resources you already have on hand —hard disk drives, printers, graphic plotters and the like.

Built-in local area networking makes it possible.

PCterminal won't limit your existing PC's performance either. Because it has its own 8088 microprocessor and 64 KB of random access memory, expandable to 256K.

Very intelligent indeed.

But that's not all. Built-in parallel and serial ports, along with four expansion slots enable you to add a host of peripherals, as well as additional memory, graphics cards and other productivity enhancers.

The Santa Clara Systems $1595 PCterminal. A small price to pay for a big gain in productivity.

You won't find a better value anywhere. Your local Santa Clara Systems distributor can prove it. Call and order yours today.

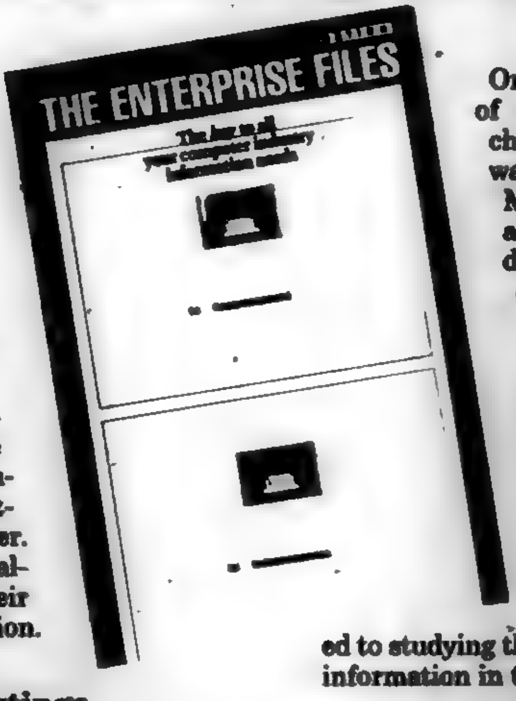
Send for this FREE brochure and find out why the Enterprise Files may be your most important marketing tool

The Enterprise Files from International Data Corporation give you the detailed sales information you need to stay ahead in today's competitive computer market.

Now you can locate prospective clients, fine-tune your promotional campaigns, and track competing companies. And you'll do it all quickly, easily, and accurately.

When you subscribe to the Enterprise Files you'll get up-to-date facts on more than 13,000 companies and the 35,000 computer-related products & services they offer. Many leading organizations have already made the Enterprise Files their number one source of information. Here are four reasons why. . .



IDC
THE ENTERPRISE FILES
The key to all your computer industry information needs

1) Comprehensive listings

The Enterprise Files are divided into two general categories, Vendor Files and Product Files.

Each vendor profile includes: company and division names, parent company, address and telephone number, type of company, number of employees, years in business, target industries, target applications, key corporate executives, geographic coverage, and product/service offerings.

Every product profile includes: price, model number, date of introduction, the number of installations, channels of distribution, and market status. Also, each product or service is researched individually, with up to 25 product-specific characteristics identified.

You'll get everything you need to compare product specs and contact vendors.

2) Custom packaging

No matter which companies and products interest your organization, you can get the information you need, the way you need it. Because the Enterprise Files are available in three ways. You can choose the complete file, any of 26 standard subfiles, or custom packaging. So you'll pay only for what you need.

3) Easy to use

Once you've determined what kind of information you need, you can choose between three convenient ways of receiving your information. Magnetic tape for permanent storage, pressure sensitive labels for direct mail promotions, and hard copy for a handy resource tool.

4) Accurate listings

The information in the Enterprise Files is gathered and updated daily by International Data Corporation. IDC has been the leading market research firm covering the information processing industry for 20 years. And IDC is the only firm solely dedicated to studying this market. So you can rely on the information in the listings.

Send for your FREE brochure today

Can you afford to be without this kind of detailed information about your industry? Put the Enterprise Files to work for you. Call Mike Hovagimian today to get your FREE copy of our brochure. It describes what the Enterprise Files are, what your custom packaging options are, and includes a rate sheet. Call right now. You can reach Mike at (617) 872-8200.

Or, if you prefer, fill out the coupon below and return it today.

Utility's DBMS overhaul keys DP modernization

POUGHKEEPSIE, N.Y. — Entering the 1980s, Central Hudson Gas & Electric Corp., an investor-owned utility here, was having increasing difficulty providing rapid, accurate response and service both to its 285,000 customers and to its internal corporate users.

Faced with a small DP staff, more than 80% of whom had less than one year's experience; a corporate five-year plan for new systems development; 20-year-old tape systems; development lead times extending beyond reason and acceptability; and increasing demands for improved customer service by regulatory agencies, it was clear to Robert Berger, director of electronic data processing at Central Hudson, that a new approach was needed. After just three years of effort, Central Hudson's DP staff solved those problems and created in the process what it believed to be one of the most complete, flexible and responsive customer information systems in the utility industry.

At the root of Central Hudson's problems was its reliance on batch autocoder systems developed in the 1960s to process the core of the utility's customer, financial and plant accounting data. Remedies to provide on-line query to files refreshed nightly were straining under a daily load of more than 1,800 service-related calls as well as 20,000 billing, payment and main-

Users group boom: Food for thought

Users groups are taking off. Based on observations from attendance at eight of them this year, it appears this concept of getting together to meet your fellow users is more popular than ever. Many users groups are seeing attendance double each year. And with their new popularity, planning has become more critical than ever.

The following, in no particular order, are some of the issues that arise most frequently:

- Should your group be independent or vendor-sponsored? This is the most critical decision the users can make. Groups that the vendor pays for are

Integration tops SI plans

GE software division plans several releases

By Paul Gillin
CW Staff

SAN DIEGO — GE Software International Corp. (SI), which has suffered from charges of poor integration and documentation of its application software packages, is planning major new releases of virtually all of its products next year with a new focus on common functions and ease of use.

Speaking at the 15th Software International Users Group held here recently, Robert Tatum, vice-president of technology at Software International, said the integration will focus on seven areas: Smart Link, Software International's microcomputer-mainframe link; common screens and transaction processing; security; Help messages; navigator aids; queries; and doc-

Phase systems in gradually

Businesses are spending billions of dollars each year to implement information resource management systems. Due to their size and complex nature, these systems commonly take from five to 10 years to implement. But with a strategy in which systems are phased in gradually, the organization can have usable systems within 12 to 18 months.

The possible ramifications of improper implementation decisions on projects of this magnitude can include a doubling or tripling of the original budget, not to mention the chaos and disruption an improper decision can cause within an organization.

This article presents some critical success factors related to the phasing-in of major information management projects, which corporate MIS managers should bear in mind. Before any business decision can be made, it is necessary to gather a minimum of information, including an understanding of how the existing system functions, how the proposed system will function, the data model required to support the proposed system and the effect the proposed system will have on the organization.

Any implementation decisions made without this minimum knowledge could have catastrophic effects on the organization. Once this information is gathered, there are also organizational, cultural and technological critical factors that must be addressed.

Every system, large or small, must be

IBM Disoss interface out

NATICK, Mass. — Software Research Corp. has introduced an IBM Distributed Office Support System (Disoss) interface software package intended for use with non-IBM office automation equipment and IBM's Disoss document library and distribution software.

Residing on an IBM host mainframe, Docupower is implemented in IBM's CICS/VS operating environment, the vendor said.

Supporting IBM Systems Network Architecture and binary synchronous protocols, Docupower enables users to format an IBM Document Interchange Architecture command from a non-IBM OA product and allow it to be interpreted by Disoss, according to the vendor.

Information dispersal

As a result, information reportedly can be disseminated to all office automation equipment linked via a network — including systems from Honeywell Information Systems, Inc., Lanier Business Products, Inc. and Wang Laboratories, Inc.

The price of Docupower is $15,000 for the first copy and $5,000 for subsequent copies.

For further information, Software Research is headquartered at One Natick Executive Park, Natick, Mass. 01760.

SYSTEMS SOFTWARE

KISCO INFORMATION SYSTEMS
F1 Manager

Kisco Information Systems has announced F1 Manager, a disk space management package for the IBM System/36 minicomputer running under IBM's SSP operating system.

According to a spokesman, the F1 Manager spotlights inefficient disk uses and searches out poor file and library placements. It also analyzes changes in disk usage. A time analysis feature forecasts when the next disk upgrade may be required, up to three years in the future.

F1 Manager is said to leave a descriptive record of all files and libraries located on a System/36 fixed disk. When disk upgrades are installed, the package recognizes them automatically and readjusts output reports to show the expanded disk resource.

A one-time license fee is $250.

Kisco Information Systems, 120 Beverly Road, Mount Kisco, N.Y. 10549.

GRANADA SYSTEMS DESIGN, INC.
PC/Sail

Granada Systems Design, Inc. has announced an interactive IBM Personal Computer communications hardware and software product that permits communications between asynchronous devices — such as cash registers, audio response units and optical character recognition/bar code wands — and an IBM System/34, System/36 or System/38 minicomputer in a real-time, on-line mode. The communications link from the IBM Personal Computer to the IBM minicomputer is via a native IBM 4251/12 protocol.

According to a spokesman, the PC/Sail system provides the necessary intelligence and multitasking required to read data from an asynchronous device, transmit the data to the host minicomputer in real-time and, at the same time, translate the asynchronous protocol to a standard IBM 5251/12 synchronous protocol.

The package includes a Synchronous Data Link Control board, an asynchronous communications board and a diskette with the software. It is priced at $1,600.

Granada Systems Design, 303 Fifth Ave., New York, N.Y. 10016.

COMPUWARE CORP.
DOS/CICS Abend-AID

Compuware Corp. has introduced a version of its Abend-AID for IBM's 4321 or above processors and compatibles running under IBM's DOS/CICS environment.

According to a spokesman, DOS/-CICS Abend-AID provides on-line access to English diagnostics explaining the cause of system abends, as well as a solution to the problem. CICS data is formatted so that no hexadecimal calculations or address chaining are required. The output is written to DOS/CICS Abend-AID's self-contained data set. All file areas are formatted by record, and file input and output statistics are provided. The system's trace table contains only those entries associated with the abending task.

The price of DOS/CICS Abend-AID ranges from $4,800 to $7,500, depending upon the computer.

Compuware, 32100 Telegraph Road, Birmingham, Mich. 48010.

PROGRAM ACCOUNTABILITY & EVALUATION, INC.
Timer/38

Program Accountability & Evaluation, Inc. has announced a job scheduling system for the IBM System/38 running under IBM's CPF 2.0 operating system.

According to a spokesman, Timer/38 controls System/38 installations around the clock and submits jobs from powering up or down to reorganizing files.

The price of Timer/38 is $500.

Program Accountability & Evaluation, Seven Riverway Road, Salem, Mass. 01970.

AK, INC.
Trace

AK, Inc. has announced a program debugger that operates on IBM processors under IBM's MVS, MVS/TSO or VM/CMS operating systems.

According to a spokesman, the Trace debugger prints the results of the execution of machine language instructions of the traced program as they are being executed. It reportedly prints in a fixed format, including information on condition code, whether a branch was taken, contents of involved registers and contents of storage areas referenced by the instruction.

The price of the Trace program debugger is $2,500.

AK, 1671 McBain Ave., San Jose, Calif. 95125.

MICHAELS, ROSS & COLE LTD.
MRC-Maintainer 4.0

Michaels, Ross & Cole Ltd. has announced enhancements to its MRC-Maintainer application generator for the IBM System/38 minicomputer.

Designed for nontechnical users, the product reportedly provides fourth-generation language capabili-

ties to the System/36, according to the vendor.

MRC-Maintainer features on-line help, multifile lookup and edit capabilities, an audit trail, field editing and message file interface, according to the vendor. The program is said to work with existing System/36 data bases.

MRC-Maintainer costs $1,140 per CPU.

Michaels, Ross & Cole, P.O. Box 4532, Oak Brook, Ill. 60521.

DIGITAL EQUIPMENT CORP.
VAX VTX Videotex Software Version 1.1

Digital Equipment Corp. has announced a version of its VAX VTX videotex software that adds support for British Telecom's Prestel (Level 1) terminals and Ansi North American Presentation-Level Protocol Syntax (NAPLPS) graphics display protocols on DEC's Professional 350 workstation running PRO/NAPLPS, Sony Corp.'s VDX-1000 videotex unit and Norpak Corp.'s Mark IV videotex decoder, as well as DEC's Dectalk text-to-speech terminal.

VAX VTX videotex subscribers also can use the IBM Personal Computer as a videotex terminal using Microstuf, Inc.'s Crosstalk XVI Ascii/VT100 emulation package. VAX VTX runs under both DEC's VMS and Micro VMS operating systems and supports all of DEC's VT100 and VT200-compatible terminals.

VAX VTX Version 1.1 videotex is a multiuser, layered software product that provides distributed videotex services in a business environment.

The price of a full license for the VAX VTX Version 1.1 is $25,000, and it will be available in December 1984.

DEC, Maynard, Mass. 01754.

SYNAPSE COMPUTER CORP.
Synapse Program Generator

Synapse Computer Corp. has announced the Synapse Program Generator which works with the company's N+1 On-Line Transaction Processing System.

The product accelerates the development of Cobol transaction application programs and screen forms, according to the vendor. Synapse Program Generator is nonprocedural and only requires that the programmer answer screen prompts, the vendor said.

With the product, a user reportedly can create interactive programs that read, write and update relational data base rows; batch programs that process large numbers of data base rows; programs that create listings of selected portions of a data base; and file-transfer programs that move data from other systems to a Synapse system.

The Synapse Program Generator is priced at $7,500.

Synapse Computer, 801 Buckeye Court, Milpitas, Calif. 95035.

PRODUCTIVITY AIDS

OXFORD SOFTWARE CORP.
UFO/Cobol 1.1

Oxford Software Corp., has announced that its UFO/Cobol application generator will now work in an IBM VM/CMS operating environment.

UFO/Cobol 1.1 is said to allow the UFO Cobol programmer to develop IBM CICS applications in the VM/CMS operating environment. The new release reportedly allows the user to transfer control of UFO/Cobol programs to other CICS programs and allows a CICS programmer to communicate with UFO/Cobol programs.

A new clause allows the cursor to be positioned by field name in the program, the company said. With the enhancement, the program reportedly can do a compile from multiple libraries.

Cost of the program under IBM's CMS and DOS operating system is $24,000. Cost for IBM's OS operating system is $33,000, according to Oxford Software.

Oxford Software, 174 Boulevard, Hasbrouck Heights, N.J. 07604.

DATABASE UTILITY GROUP
Adabas Performance Analysis System 2.0

Database Utility Group has announced enhancements to its Adabas Performance Analysis System (Apas) which runs under IBM's MVS and DOS operating systems.

The product works with Software AG of North America, Inc.'s Adabas data base management system. Enhancements include fields for summarizing descriptor and field usage, user-defined fields and nucleus statistics fields for interactive display and interval reporting.

Apas reportedly features a histogram output format, an improved history system, the ability to selectively copy fields and improved recovery and operating system interfaces. Apas is priced at $8,750.

Database Utility Group, P.O. Box 4012, Federal Way, Wash. [illegible]

SOFT WEAR MANAGEMENT, INC.
Service/36

Soft Wear Management, Inc. has introduced a documentation and object management program for use on the IBM System/36.

According to the company, Service/36 has more than 50 commands, organized into four modules, each with its own user reference manual, providing both on-line and hard copy.

The four modules, Object Analysis, Object Management, Text Writer and Report DOC, sell for $1,275.

Soft Wear Management, 11161 Greenhurst Drive, Riverside, Calif., 92506.

SOFTWARE & SERVICES

PANSOPHIC SYSTEMS, INC.
Version 3.5 Gener/OL

Pansophic Systems, Inc. has announced an enhanced version of its Gener/OL fourth-generation language for interactive, on-line program development. Gener/OL is designed for use with IBM's 360, 370 and 4300 series and compatible computers under IBM's DOS or OS operating systems with CICS 1.5 and higher.

According to a spokesman, Gener/OL 3.5 is said to support the blending of applications written in Gener/OL with applications written in CICS Command Level, cross-referencing of maps and programs and full support of temporary storage. Additional features include a handle condition to intercept the clear key and a security system which allows multiple users to log on to a single user identification.

The enhanced version of Gener/OL is available at no cost to domestic Gener/OL users under current maintenance agreements. Price of Gener/OL 3.5 for DOS is $36,000 and for OS is $48,000.

Pansophic Systems, 709 Enterprise Drive, Oak Brook, Ill. 60521.

INDEX TECHNOLOGY CORP.
Marketing contract with IBM

Index Technology Corp. (Intech) has announced that it has entered into a contract with IBM, through which IBM will market Intech's Excelerator system for the IBM 3270 Personal Computer.

Excelerator provides facilities for analyzing, designing and documenting information systems on the 3270-PC. It allows users to develop and revise data flow diagrams, structure charts, data model diagrams and other components of a system specification document.

Excelerator's mouse-driven graphics capabilities allow users to create diagrams, and the system's presentation graphics provide for the production of documents for client or management review. In the graphics mode, the system can draw icons representing terminals, floppy disks and people.

The spokesman said all information about system design is stored and integrated through the product's data dictionary. The dictionary includes descriptions of programs and processes, data elements, data records and files. Excelerator reportedly can also transfer data to and from the 3270-PC and a mainframe or other workstations on a local-area network. Through the product, an analyst can develop an integrated system specification document, including report layouts, screen definitions and record and file layouts.

Excelerator software is priced at $8,500.

Intech, 5 Cambridge Center, Cambridge, Mass. 02142.

SOFTWARE CONNECTION, INC.
Kwic-File

The Software Connection, Inc. has developed a text indexing and search productivity aid called Kwic-File for use with Wang Laboratories, Inc.'s VS line of computer systems.

Kwic-File is said to allow users to enter certain words or phrases and retrieve all documents in the system that contain those words or phrases. The system is recommended for litigation support, as well as a bill tracking, research, credit and property records maintenance.

The price of Kwic-File is $6,000.

Software Connection, Suite 200, 5455 S. Yosemite St., Englewood, Colo. 80111.

APPLICATION PACKAGES

MCBA
Dibol Release 7

MCBA has announced that its Dibol accounting and distribution software is now available for Digital Equipment Corp.'s VAX-11 computers.

According to the company, the nine software packages that make up Release 7 of Dibol are modular, integrated systems. The package consists of accounts payable, accounts receivable, bill of materials processor, customer order processing, fixed assets and depreciation, general ledger, inventory management, payroll and purchase order and receiving.

Prices range from $900 to $4,500, depending on the hardware model.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.

SOFTWARE INTERNATIONAL CORP.
Fixed Assets Management enhancement

Software International Corp., has announced an on-line version of its Fixed Assets Management software package.

The new version runs under IBM's OS and DOS operating systems and is said to feature real-time edit and update of the Asset Master File. It reportedly allows users to add records to the file, update records already in the master file and inquire on the field. According to the company, an on-line Help facility is provided with the system.

The company's Fixed Assets Management System is a book and tax system that reportedly helps accounting, finance and tax personnel fulfill internal and external asset accounting, property control, tax accounting and information control requirements. It includes a multicorporation, multicompany structure, asset accounting, property and locations control, depreciation projection, tax control and insurance valuation.

Continued on page 90

Until just two years ago, communications between big IBM® mainframes and individual PCs was all smoke, without a bit of substance.

But two years ago, the smoke lifted.

With IRMA™, for the first time, PC users could extract needed information from the mainframe without going through MIS unnecessarily. All at once middle and upper management had a way to get timely information to make better decisions. But as revolutionary as IRMA was, it was far from the total answer.

The truth is, neither were our next two products. But we were getting closer. IRMAline™ and IRMAlette™ gave remote PCs the opportunity to communicate with the mainframes with the same ease as a local PC equipped with IRMA.

Because they were IRMA family products, all the software written for IRMA was compatible with IRMAline and IRMAlette.

As we developed each new product to meet a business need, we saw more opportunities in the marketplace. And we responded to them.

With IRMAcom™, an IBM 3274, 3276 controller emulator. With IRMAprint™, an IBM 3287 emulator. With IRMAlink DBX/CICS™ an MIS-controlled data file transfer system. And with IRMAkey™, a keyboard that has every one of the functions of both an IBM terminal and PC.

For additional information about IRMA or any of the IRMA family of IBM-emulation products, send in the coupon below. Or call 1-800-241-IRMA. Telex 261375 DCAATL.

Mail to DCA, 303 Technology Park, Norcross, GA 30092.
And we'll tell you more about all IRMA products.

Continued from page 67

The on-line Fixed Assets Management system is $45,600 for DOS and $47,700 for the OS. It is scheduled for delivery in February.

Software International, 1 Tech Drive, Andover, Mass. 01810.

SPERRY CORP.
Airline Revenue Enhancement Package

Sperry Corp. has announced a market analysis system for airline marketing and reservations departments.

According to the company, the Airline Revenue Enhancement Package enables airline management to extract summary inventory data from the on-line passenger service system and analyze the data using Sperry's Mapper programming language and color graphics.

The package works with either an IBM Passenger Airline Reservation System/International Passenger Airline Reservation System or a Sperry passenger reservation system running on Sperry 1100 series mainframes.

Input for all functions is done through menu selection, fill-in-the-blank screens or expert mode. The data is analyzed using predefined Mapper 1100 functions and Mapper color graphics. A series of standard functions, exception reports and situational reports are then produced, the company said.

Cost of the package is $125,000 for the Sperry Series 1100/60 and 1100/70 configurations and $137,500 for Series 1100/80 and 1100/90 configurations.

Sperry, Information Systems Group, P.O. Box 500, Blue Bell, Pa. 19424.

CENTURION COMPUTER CORP.
Service Industry System

Centurion Computer Corp. has introduced an integrated, multiuser, multitasking automation system for service contracting businesses using Centurion Series 6000 and Series 7000 minicomputers.

According to the company, the Service Industry System automates a variety of activities in service contract maintenance, including service contract preventive maintenance, service dispatch, labor and parts allocation, inventory, vehicle maintenance, job costing, accounts receivable, invoicing, mechanic time accounting, payroll, accounts payable, general ledger and financial statements.

A complete audit trail is maintained by the system on original estimates, change orders, purchases and final costs, the company said. Reports on job status, job cost, vendor invoices and weekly labor assignments are also produced by the system, the vendor said.

Service procedures are assigned standardized codes. Business not under contract is billed the same day, with a description of the performed service printed on the invoice.

Base price of the system is $12,500 and can range up to $18,000, depending on software modifications.

Centurion Computer, 111 S. Sherman, Richardson, Texas 75081.

WESTMORELAND SYSTEMS, INC.
Bar Graph Utility enhancement

Westmoreland Systems, Inc. has announced enhancements to its Bar Graph Utility for the IBM System/34 and System/36 that allow the user to set up bar graphs for display on terminals and that format the graphs for printing.

The Bar Graph Utility interfaces with the company's Calc 34/36 financial modeling system and Applications Design and Development System. Cost of the Bar Graph Utility is $300.

Westmoreland Systems, Suite 1, 228 Park Ave. N., Winter Park, Fla. 32789.

NBI, INC.
Juris-NBI

NBI, Inc. has announced an automated legal billing system for the company's 4100 series microcomputer and its clustered Oasys 2000 Personal Computing Work Station linked to an Oasys 64 central controller.

Juris-NBI reportedly provides up to 99 user-defined bill formats; four personnel-type codes; five types of billing agreements including flat-fee, standard rate, contingency, agreed and no-charge, as well as time codes, expense codes and practice class codes.

According to the company, the system allows direct ac-

Although our HERMES 615 multi-mode printer comes in a plain black and white casing it prints text and graphics beautifully in 8 colors.

Pencils may draw in colors, but they are slow, inaccurate and their points keep breaking. Professionals choose the HERMES 615 color printer: it produces text and graphics in black, red, blue, yellow and in green, orange, violet and brown too with no rainbow fringes. Much better than this pale offset copy.

Printing and graphics in 8 colors are just two of the numerous outstanding features of the HERMES 615. Professionals who only pick the best will also appreciate:

Its speed. Bi-directional, shortest path printing. 400/480 cps Data, 100/120 cps Near Letter Quality (single pass).

Its resolution. Finest print quality available on a matrix printer. So good you can even print signatures. Bit mapped graphics in single and double density modes, 6 dot densities in each mode. A circle on the screen means a circle on the paper too!

Its quality. Swiss high quality construction. Quality that lasts – thanks to its exclusive «moving-ruby» head.

Its versatility. Wide range of attractive character sets in 15 national versions, as well as math symbols, bar codes and Teletex. Dual ports, parallel (Centronics™/Epson™ compatible) and serial (RS-232C/RS-422) interfaces. DIABLO™ 630 emulation optional.

HERMES®
The impressive printers

Manufactured in Switzerland by HERMES PRECISA INTERNATIONAL, CH-1401 Yverdon.

HERMES printers are distributed in Austria, Canada, Cyprus, Finland, France, Greece, Jordan, Kuwait, Lebanon, Saudi Arabia, South Africa, Spain, Sweden, Switzerland, United Kingdom, USA, West Germany.

To receive a sample of the finest quality matrix print-out and additional information on the HERMES 615 please return the coupon below.

cess to account information with client/matter master reference, cross-reference lists and client inquiries on the screen.

Through Jan. 31, the Oasys 4100 series bundled with Juris-NBI will be available for $8,999. Juris-NBI will be available for the Oasys 2000 at $4,695. The software is regularly priced at $4,500 for the Oasys 4100 series and $5,500 for the Oasys 2000.

NBI, P.O. Box 9001, Boulder, Colo. 80301.

HMS COMPUTER SYSTEMS, INC.
AIM/3000 Fixed Assets System

HMS Computer Systems, Inc. has announced a fixed assets system for Hewlett-Packard Co.'s HP 3000 series computers.

The AIM/3000 Fixed Assets System is said to maintain asset records and calculate depreciation for financial, federal and state reporting. According to the vendor, the system is code-driven and can permit local or consolidated asset management.

Transactions can be changed through the system without returning to a menu, the vendor said. Users reportedly can permit broad inquiry capability without losing control of update functions. The system is said to be fully on-line with an automatic interface to the company's AIM/3000 General Ledger System.

Price of the system ranges from $4,000 for the HP 3000 Series 37 to $12,000 for HP Series 68 mainframes.

HMS Computer Systems, 4524 E. 67th St., Tulsa, Okla. 74153.

MCBA
Payroll enhancements

MCBA has enhanced its Payroll system, which was written in Wang Laboratories, Inc.'s VS Cobol and runs on Wang's line of VS minicomputers.

According to the vendor, the enhancements include interactive state and local tax tables, expanded federal workman's compensation capabilities, a direct deposit feature and a variety of methods for handling vacation and sick hours. The package is said to allow a user to define a general ledger account number format that uses up to 21 characters and provides five levels of security.

Prices for source code licenses for the Payroll package range from $2,000 to $4,500, depending on the Wang VS model.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.

AMERICAN SOFTWARE, INC.
Distribution Resource Planning systems for Honeywell DPS 8, DPS 88

American Software, Inc. has announced that two of its Distribution Resource Planning (DRP-8) subsystems are now available for Honeywell, Inc.'s DPS 8 and DPS 88 computers running under Honeywell's Gcos 8 operating system.

According to a spokesman, the DRP-8 Demand Forecasting System enables marketing management to tailor forecasts according to time, geography, product, volume and dollar requirements. Demand Forecasting includes three standard modules: Basic Forecasting, Item Forecasting and Product Group and Item Forecasting.

The DRP-8 Inventory Management System consists of four modules: Inventory Planning, Distribution Requirements Planning, Inventory Deployment and the Vehicle Scheduling & Loading module.

The initial license fee for the basic DRP-8 Demand Forecasting System ranges from $20,000 to $80,000. For the DRP-8 Inventory Management System, initial license fees range from $20,000 to $65,000.

American Software, 443 E. Paces Ferry Road, Atlanta, Ga. 30305.

ENTERPRISE TECHNOLOGY CORP.
Generalized Reporting System 2.02

Enterprise Technology Corp. has enhanced its Generalized Reporting System (GRS), which runs on Digital Equipment Corp.'s VAX-11 line of superminicomputers under DEC's VMS operating system.

GRS Version 2.02's query language uses one or two commands to produce formatted reports that include page numbers and column headings, according to the vendor. Data summarization statements and an advanced set of calculations allow the user to aggregate data and perform complex analyses, Enterprise Technology said.

The enhanced product reportedly supports applications written in VAX Cobol, Basic, Fortran and Dibol. GRS is said to support standard sequential, relative and indexed file structures.

GRS is priced at $6,500.

Enterprise Technology, 306 Madison Ave., New York, N.Y. 10165.

PARA RESEARCH, INC.
Accounts Receivable

Para Research, Inc. has announced its accounts receivable package designed for the IBM System/34 and System/36 minicomputers.

The product is designed for a large customer base, multiple entity businesses and small businesses.

With the product, a user can follow the day-to-day work flow of an accounts receivable department and examine customer accounts by using a customer inquiry feature that displays open items and customer balances, the vendor said.

A cash application screen displays 10 open invoices and allows the user to mark one of several for payment, Para Research said. The system will then automatically produce a balance for the accounts.

The package is priced at $2,500, the vendor said.

Para Research, 85 Eastern Ave., Gloucester, Mass. 01930.

The four most important days of the new year for telecommunications users!

JANUARY

START "THE YEAR AFTER DIVESTITURE" OFF RIGHT — WITH COMMUNICATION NETWORKS '85.

This is it — America's *national* telecommunications forum — the first, the most comprehensive and the most important conference and exposition of the year. It's the Seventh Annual COMMUNICATION NETWORKS Conference & Exposition, with:

- the *largest* conference program in the industry — some 80 essential seminars, topics and presentations
- the leading industry experts, including the renowned *James Martin, Arch McGill,* FCC Commissioner *Dennis Patrick,* and some 200 other speakers and panelists
- the *biggest* exhibit in COMMUNICATION NETWORKS history, with over 200 exhibitors and 750 booths, so you can see everything the technology leaders have to offer in '85.

BEGINNING AND EXPERIENCED TELECOM PROFESSIONALS WILL BENEFIT

Whether you or your staff have been in the telecommunications field for one year or ten, you'll find COMMUNICATION NETWORKS '85 of major value. In fact, what you learn here will have a significant impact on how effectively you deal with the constant changes in telecommunications in 1985.

Attend any of the 12 introductory or advanced seminars on Monday, January 28 and, as a special bonus, you'll hear the dynamic James Martin at a special late afternoon lecture. Then choose from more than 70 conference sessions, including user-oriented topics chaired by Association of Data Communications Users members. See the latest products and services on exhibit, relax in exhibitor hospitality suites and enjoy all the attractions of Washington, D.C.

REGISTER BY DECEMBER 14, 1984 AND SAVE $50 ON EACH REGISTRATION.

Don't let anyone you know miss out on 1985's most important telecommunications event. Come for all four days, or any days you prefer, to the largest and best COMMUNICATION NETWORKS Conference ever. Register for three or four days by December 14, 1984 and save $50 on each registration.

CALL TODAY, OR SEND THE COUPON BELOW TO REGISTER.

800-225-4698

In Mass., 617-879-0700

COMMUNICATION NETWORKS
CONFERENCE & EXPOSITION
Washington Convention Center, Washington, D.C., January 28-31, 1985.

Complete seminar information will be forwarded when available. Registrations cancelled later than Jan. 18 are subject to a $50.00 service charge. Registration may be transferred at no charge.

MAIL COUPON TO:
COMMUNICATION NETWORKS '85,
Box 880, Framingham, MA 01701 USA

	Before Dec. 14	After Dec. 14
☐ Sign me up for COMMUNICATION NETWORKS '85 as follows:		
☐ Monday Seminar (includes lunch)	$295.00	$295.00
☐ Monday Plus 3-Day Conference & Expo (includes lunches)	$595.00	$645.00
☐ 3-Day Conference & Expo only (includes lunches)	$395.00	$445.00
☐ 1-Day Conference & Expo (includes lunch) (check one)	$195.00	$195.00

JOHN FLUKE MANUFACTURING CO.

Progen

John Fluke Manufacturing Co. has introduced an application software package to handle data acquisition, monitoring and control.

Used in conjunction with the vendor's 2452 Measurement and Control System turnkey computer system, Progen reportedly allows the user to program up to 500 I/O channels for a wide range of applications including batch processing, process control and automated testing. No programming knowledge is required to use the menu-driven Progen.

Progen enables the user to divide applications into separate parts or task groups consisting of related channels, which can then be prioritized by the user.

The software also performs scan tasks together and limit checking, and it executes predefined procedures. Errors are automatically displayed in an error file, the vendor said.

The price of Progen is $2,990.

John Fluke Manufacturing, P.O. Box C9090, Everett, Wash. 98206.

HMS COMPUTER SYSTEMS, INC.

AIM/IMS

HMS Computer Systems, Inc. has introduced the AIM/IMS inventory management system designed to provide distributors, assemblers and light manufacturers with inventory planning and control capabilities in either single or multiple locations. The software runs on Hewlett-Packard Co.'s HP 3000 series under HP's MPE operating system.

According to a spokesman, the three AIM/IMS modules — Inventory Control, Customer Order Processing and Purchasing — are compatible with the current AIM/FMS financial system. Features include the ability to move directly from one transaction to another without return to a menu; multilevel user-defined menus; screen print functions; transaction suspend/resume functions; and an end-user report writer. The system will carry along key information allowing users to access new screens without having to reenter item numbers, order numbers or dates.

The total package is priced between $9,000 and $42,000, depending upon the CPU. Each module may also be purchased separately.

HMS Computer Systems, P. O. Box 35505, Tulsa, Okla. 74153.

PDA ENGINEERING

Patran

PDA Engineering has announced that its geometric and analytical modeling package, Patran, is now available for Evans & Sutherland Computer Corp.'s PS 300 family of three-dimensional computer graphics systems. The modeling package operates on Digital Equipment Corp.'s VAX-11 under DEC's VMS operating system and on the Data General Corp. MV series of superminicomputers under DG's AOS/VS interfaced to the PS 300 system.

According to a spokesman, Patran provides solids modeling, color shaded imaging, finite element generation and analysis and results evaluation. In the Patran/PS 300 configuration, modal vibration animation generated within the PS 300 processor frees the host for further analysis, computations and other tasks. Patran uses solid and surface modeling techniques to allow definition of an engineering mode.

Price of the Patran package for the PS 300 system is approximately $10,000.

PDA Engineering, 1560 Brookhollow Drive, Santa Ana, Calif. 92705.

P-STAT, INC.

P-Stat

P-Stat, Inc. has introduced its P-Stat data management and statistical analysis software package, written in Fortran, for the Sun Microsystems, Inc. Sun Workstation running under the AT&T Unix 4.2BSD operating system.

P-Stat reportedly offers data management, data display, statistical analysis and report-writing capabilities. Features include an on-line Help facility, interactive data entry, relational data base capabilities, macros, statistical commands and expandability through a user link facility. P-Stat combines both interactive and batch processing capabilities.

The price of P-Stat for the Sun Workstation is $2,000 for the first year's license and $1,000/year for annual renewal.

P-Stat, P.O. Box AH, Princeton, N.J. 08542.

INTERNATIONAL DIGITAL SYSTEMS CORP.

RAM 12

International Digital Systems Corp. has announced RAM 12, a wholesale distributor package that runs on Digital Equipment Corp.'s Micro PDP-11 and VAX-11 computers under either DEC's VMS or RSTS operating systems.

The product consists of customer order processing, puchase order and receiving, accounts receivable, accounts payable, payroll, general ledger and fixed assets and depreciation modules. It features flexible item pricing, order entry checking, inventory tracking and support for blanket purchase orders.

The general ledger system allows up to 13 accounting periods to be defined and permits transaction detail to be kept on-line for an entire year, the vendor said. The product's cost ranges from $10,000 to $30,000.

International Digital Systems, 669 E. Industrial Park Drive, Manchester, N.H. 03103.

James Martin gives you the method…now DDI gives you…

tenance transactions for customer data taken.

Paper-intensive routing

All processing activity was paper- and labor-intensive with routing, filing and retrieving information not only a logistical problem but also one resulting in extended delays and noncurrency of data. File updating was cyclical, ranging from one week to one month, with magnetic tape used as an interim storage medium. Verifying "check-in-the-mail" responses involved at least a 24-hour delay, followed by extended searches through transaction lists reflecting interim cycle processing.

Previous efforts over several years had failed to produce a sufficiently static environment from which to begin coding within an IBM PL/I CICS environment. Estimates for developing a Customer Information System (CIS) ranged from 60 to 75 man-years, depending on the complexity desired. Other system conversion estimates reflected the same labor-intensive requirements.

"The selection of [Software AG of North America, Inc.'s] Adabas and Natural was based primarily on their reputations for ease of use given the long training curve required for new personnel in other environments. We needed something that was quick, easy to learn and use and that could incorporate frequent changes without requiring data reorganization or recompilation of previously developed programs. Without this software, CIS alone could not have been completed with even 75 man-years of effort, given the amount of change introduced during the development cycle," Berger said.

After selecting a data base management system (DBMS), system development estimates were reduced to 20 man-years, Berger said. The final product was delivered in 27 man-years, including features not contained in the original system requirements. Overall savings, based on corporate development costs, were nearly $1.5 million.

Using the DBMS concept did not initially meet with universal acceptance. With CIS being a utility's "bread-and-butter" application, some members of management were skeptical of the introduction of so-called new technology. "That's putting it mildly," Berger said. "In some cases, there was outright hostility, and rightly so. It had been in development too long with few tangible results. As an end user, I would have had the same reaction."

With nine analysts assigned during peak development periods, CIS was started in January 1981. Extensive problems during the first several months reinforced the belief that the wrong methodology had been chosen. Working in close association with Software AG representatives and serving as both an alpha and beta test site for the new release, Natural 1.2 was implemented.

The first prototype of CIS was installed in December 1982. "We expected all kinds of problems but had relatively few. Other than streamlining a few programs, it was one of the more successful transitions I've ever encountered," Berger said. The initial portion involved replacement PL/I query programs, interfaces to the autocoder system and included customer contact processing, trouble and service call recording and follow-up, name and address changes and general inquiry capabilities. The complete CIS system was installed Jan. 1, 1984.

Most DP shops introduce new technology by starting with a small, easily managed task. However, CIS represented the largest, most important single application within a utility. Driven by user necessity, not only did Central Hudson take on CIS, but also added the conversions of the financial and plant systems in 1982 with an initial staff of three analysts.

CIS is an interactive on-line system providing prompt responses to customer inquiries; creation, scheduling and dispatching of field service orders to and from remote locations; modification of customer account information from any location with point-of-entry editing and correction; and corporatewide access to current and comprehensive consumer data.

Accounting system

Customer Accounting System is both an on-line and batch support system for CIS and includes meter reading processing, service bill calculation, payment posting, accounting adjustments to customer data, follow-up collection analysis on late and overdue payments and the generation of reports to satisfy internal, state and federal regulatory requirements. The system was designed as a highly modularized application containing more than 850 programs, some 90% of which were written in Natural. The 1982 interim system required only minor modifications to interface to the DBMS rather than autocoder fields.

End-user satisfaction with CIS is reflected by customer services office supervisors who are responsible for handling customer inquiries and complaints. The supervisors find information on customer accounts to be available in greater detail and displayed in more practical formats, permitting faster and better responses for the customer. Besides reducing the delay between the receipt and response to a request, CIS has eliminated the reams of paper that had to be filed and analyzed.

Following on the heels of CIS, the plant and financial systems were installed in April 1984, providing the first interactive on-line access to that data. The flexibility of the Adabas DBMS and Natural made the concurrent conversions possible and made a large dent in the corporate five-year plan.

programming.

While doing research for their recent book,* James Martin and Carma McClure reviewed seventeen diagramming techniques and came to one overwhelming conclusion:

Action diagrams are the simplest and best method of representing structured programs.

Action diagrams combine graphic and narrative notations in a rigorous but easy-to-understand technique. The method is applicable to any size program. In almost any language.

When used to sketch out program logic, action diagrams encourage correct structured thinking. Logic errors become more apparent. Communication improves among programmers, analysts, and end users. And top-down design is enhanced, because action diagrams handle any level of logic, from systems overview to detailed program code.

**Diagramming Techniques for Analysts and Programmers* Prentice-Hall, 1984

Fast, full-screen editing with ACTION DIAGRAMMER™ and an IBM PC.

Working closely with James Martin, DDI has developed an action diagram editor for the IBM Personal Computer and 100% compatibles. The Action Diagrammer™ editor lets you create and update action diagrams right on the screen. You draw brackets with a single keystroke. Manipulate text with all the power of a visual editor. And expand or contract to focus on any level of detail you choose.

The net result: faster application development

With Action Diagrammer you can develop designs and programs faster, and with fewer errors. Maintenance is easier too, because Action Diagrammer enforces logic structure and provides excellent documentation.

The price is easy too — only $495

The Action Diagrammer software package sells for $495 and comes with a complete user guide, which includes a thorough overview of the action diagramming method. No serious programmer or analyst with access to an IBM PC or compatible should be without it.

Even more features

- Represents logic hierarchy with nested brackets for all constructs such as sequence, selection, case, and repetition. Can also represent database actions and subprocedures
- Automatically supplies control structure syntax in English, COBOL, PL/I, FORTRAN, C, Pascal, and many 4th generation languages including FOCUS, RAMIS, NOMAD, MANTIS, IDEAL, NATURAL, and ADS/O
- Offers one-stroke commands and user programmable function keys
- Shifts mainframe software development to PC's
- Allows color coding of diagram sections through user control of text and bracket colors (for users who have a color monitor)
- Includes ample help messages and other on-line documentation
- Produces hard copy of action diagrams on any IBM PC-compatible printer. Graphic output on IBM graphics printer or HP7470A plotter

ACTION DIAGRAMMER is a trademark of Database Design, Inc.

If the space program had advanced as fast as the computer industry, this might be the view from your office.

And space stations, Martian colonies, and interstellar probes might already be commonplace. Does that sound outlandish? Then bear these facts in mind:

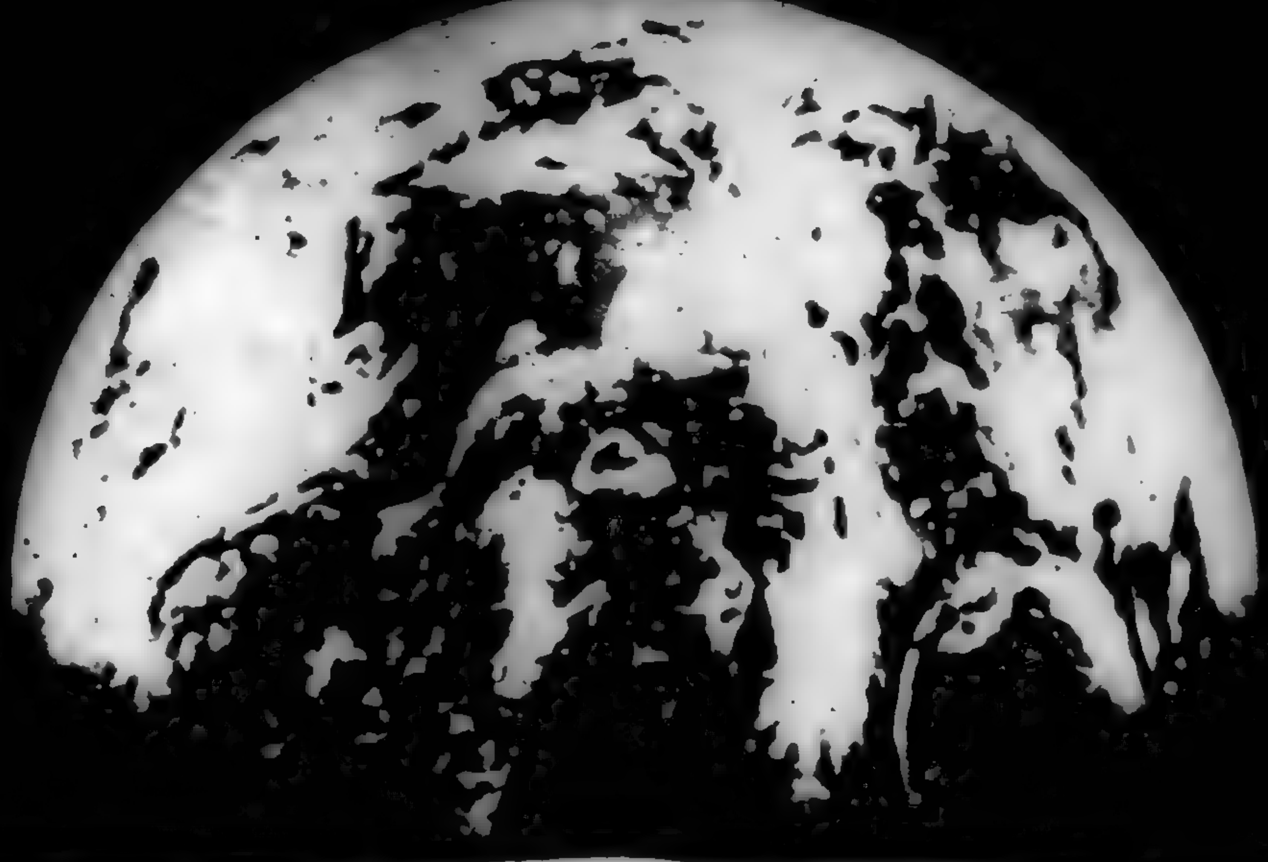
In 1946 ENIAC was the scientific marvel of the day. This computer weighed 30 tons, stood two stories high, covered 15,000 square feet, and cost $486,840.22 in 1946 dollars. Today a $2,000 kneetop portable can add and subtract more than 20 times faster. And, by 1990, the average digital watch will have as much computing power as ENIAC.

The collective brainpower of the computers sold in the next two years will equal that of all the computers sold from the beginning to now. Four years from now it will have doubled again.

It's hard to remember that this is science fact, not fiction. How do people keep pace with change like this? That's where we come in. We're CW Communications, Inc.—the world's largest publisher of computer-related newspapers and magazines.

Every month, over 9,000,000 people read one or more of our publications

Nobody reaches more computer-involved people around the world than we do. And nobody covers as many markets. In the United States we publish three computer/business journals. *Micro Marketworld*, for businesses selling small computers and software. *On Communications*, the monthly publication covering the evolving communications scene. And *Computerworld*, the newsweekly for the computer community, is the largest specialized business publication of any kind in this country.



We also offer seven personal computer publications. *InfoWorld*, the personal computer weekly, is a general interest magazine for all personal computer users.

The other six are monthly magazines that concentrate on specific microcomputer systems. *PC World*, the comprehensive guide to IBM personal computers and compatibles. *inCider*, the Apple II journal. *Macworld*, the Macintosh magazine. *80 Micro*, the magazine for TRS-80 users. *HOT CoCo*, the magazine for TRS-80 Color Computer and MC-10 users. And *RUN*, the Commodore 64 & VIC-20 magazine.

And we have similar publications in every major computer market in the world. Our network of more than 55 periodicals serves 25 countries. Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Italy, Japan, Korea, Mexico, The Netherlands, Norway, People's Republic of China, Saudi Arabia, Southeast Asia, South Africa, Spain, Sweden, United Kingdom, United States, and West Germany.

The sooner we hear from you, the sooner you'll hear from our readers

Simply put, we'll make it easy for you to reach your target audience — and for them to reach you. Call today for more information. You'll find the number below.

umentation. The major new product in this area will be a query system to be released next year. The package, which is based upon Software AG of North America, Inc.'s forthcoming Supernatural language, will eventually offer borderless query across all Software International applications. The query language will first run on general ledger files, but will be added to new releases of all other financial applications.

Smart Link capabilities will be incorporated into all financial products over the next year, Tatum said. Currently, Smart Link only supports Software International's general ledger package. Common screens and transactions are an area of particular emphasis.

"If you look at general ledger and accounts payable now, it's hard to believe they were built by the same company," Tatum said. "In the future, all screen definitions will reside externally to the applications, and we will provide tools to change the definitions to suit your shop without going into the application program."

Help screens

Help screens will be designed so that they can be loaded into customer libraries for access by programmed function keys, Tatum said. Users will be able to access a Help screen and return to the original transaction screen without losing any of the attributes of the transaction screen, a feature called "sticky cursor."

Security, navigator aids and queries will be standardized through a system manager that Software International has been employing to rebuild the on-line portion of its applications for the last 14 months.

The system manager, which includes a fourth-generation language, will make Software International applications virtually independent of a teleprocessing monitor or data base management system (DBMS). All data base interfaces will be accomplished through a set of generic calls that do not require programs to rely upon a specific DBMS, he said.

In addition, all teleprocessing-monitor-dependent calls will be removed from the system manager.

In all, Software International plans "one release next year for each major product," Tatum said. "There will be only one, and it will be thoroughly tested and documented."

Tatum acknowledged the weaknesses of past Software International release policies, which in one instance had two releases sent out less than three months apart.

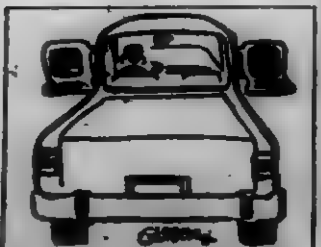
"Software International was doing a very poor job in certain areas," he said. "We were developing systems without a real commitment to education. The documentation was substandard, and we didn't have a commitment to quality assurance. Releases were going out without adequate testing. I don't think management really understood the effects that had on the customer."

Aided in large part by the influx of $33 million in capital since General Electric Co. acquired it in 1982, Software International has entirely reorganized its development and support functions. Previously, Software International "was so bogged down in support activities that we weren't developing new products," Tatum said.

Under the new structure, a staff of 64 will work solely on new development. A separate staff will work entirely on customer support and maintenance. Software International plans to spend $12.2 million on documentation next year, he added.

In addition, the company will attempt to shorten the time required to convert applications from IBM mainframes to the variety of minicomputers the company supports. Previously, such migrations had taken up to one and a half years to complete.

Software International has entered into agreements with a number of smaller vendors that will perform the conversions from the mainframes to systems from Wang Laboratories, Inc., Digital Equipment Corp. and Hewlett-Packard Co.



GROUP

from page 63

much easier and cheaper to manage, but do not offer nearly as much flexibility as those administered by users. If your goal is to learn from the vendor and to talk with other users, this may be an acceptable alternative. If you are more interested in forming a distinct body to air gripes and suggestions, the independent groups have more clout.

If you choose to go the independent path, be aware of the commitment it requires. For large groups in particular, the officers may spend as many as 60 hours in preparation during the month prior to a conference. They should also plan to meet at least two or three other times during the year for a day or more.

■ Should your group structure be centralized or decentralized? Some groups rely on local users groups to hold frequent meetings and then to consolidate concerns and observations at an annual gathering. Others hold large, semiannual, national meetings for all users. If you decide to emphasize regional groups, think about what role they will play in the annual conference. You will want to exchange ideas on running the separate groups as well as technical and management issues.

■ Should you charge dues? This is a good idea if you want to do more than just hold an annual conference. One users group, however, bypasses dues by simply planning for a surplus after its annual meeting. The windfall funds other programs during the year.

■ How do you want to communicate among members and between the users group and the vendor? An important function of a users group is to provide feedback to the vendor. The best way to compile that material is to communicate among users. Do you want to publish a newsletter? Fund an annual survey? Stick to regular telephone contact?

■ Where and when should national conferences be held? This depends largely on where the members are located. Most companies do not have deep pockets when it comes to travel budgets. It makes sense to move conference sites to various locations around the country at different times of the year so that everyone gets a chance to attend at least once every two years.

■ What do users expect from a conference? A young company will probably have many new users who are interested in more basic instructional sessions. A more experienced user base will get more out of "rap" and "helpful hint" sessions. This affects not only the makeup of your agenda but also influences how much representation you want from the vendor. Tips and techniques are better presented by other users.

■ What is the makeup of the user base? Is it mostly DP or mostly nontechnical users? Your conference agenda should reflect your audience. Make sure there is an adequate number of sessions for each group. Do not forget to include the new users.

■ Who should serve on the advisory board? These people are looking at a commitment of 20 to 100 hours each year to attend to administrative tasks. Their companies should be willing to give them the time and travel budgets to perform their duties.

It is also important that the advisory board reflects a mix of DP people, end users and new users with regional considerations also in mind. You do not want the board to be too large, but you want it to represent the concerns of the user base.

■ How should conferences be organized? The most successful meetings seem to be those that plan tracks organized around different product lines. Some attention should also be given to industry groupings — banking, manufacturing and so on. Plan for a good mix of success stories and technical sessions along with product demonstrations, previews of new releases and gripe sessions.

■ Should you invite the media? Some groups feel this is an excellent way to gain visibility for themselves and for the products. Others feel stymied and nervous when members of the media are around. This is an individual decision of your users group.

Try attending a meeting of an established users group for a product that you are considering or already have in-house. There are many excellent users groups out there.

Cityscape in alternative resources: solar, wind and geothermal technologies are applied to maximize energy efficiency. Solar panels form windprops which rotate parallel to desert surface; temperatures of air and water supplies are maintained by flows through buried conduits.

If You Can Imagine It...

CYBER Can Run It.

It's true. The uses of the CYBER 180 computers are limited only by the breadth of the human imagination.

So the question is not whether you could benefit from this kind of computer power. The question is, does a CYBER fit your budget?

To this question, Control Data has developed an astonishing new answer.

Introducing the Supermini 810.
The new 64-bit word Supermini 810 does everything you'd expect of a supermini system. But that is only the beginning.

In terms of all the usual criteria — performance, application portability, compatible growth potential, ease of installation and the increasingly sensitive matter of security — the Supermini 810 represents some very impressive technology.

But the most impressive aspect of this new supermini computer system may be its price.

The incredible $250,000 system.
Actually, a Supermini 810 could

run less than $250,000.

And, we're not talking some bare-bones unit either. We're talking about a state-of-the-art supermini system, complete with operating software and peripherals, up and running. The more you learn about the system the better that price looks.

CYBER power begins where other systems reach their limits.
You can look at the Supermini 810 as the ultimate supermini computer system. It's exciting enough in those terms. But it is *only* the entry point to a compatible family of systems that boasts a 1-to-60 performance range. That is the largest compatible growth path in the industry.

So when you look beyond today and see the potential to accommodate growth, you can really appreciate the significance of this new system.

With the CYBER 180 performance range you can, if you wish, enter fully into supercomputing. You can expand your computing power as your future needs warrant. And you can do it in an orderly fashion, and at manageable costs, without massive operational disruptions.

You can start with a call or letter.
We hope what you've learned so far will stimulate you to explore the possibilities presented by the Supermini 810. You can do that by calling 1-800-253-4004 ext. 146. (In Minnesota, 1-612-921-4400 ext. 146). Or by writing Computer Systems Marketing, Control Data Corporation, P.O. Box 0 HQW09G, Minneapolis, MN 55440.

CONTROL DATA

Addressing society's major unmet needs as profitable business opportunities.

PHASING

from page 63

evaluated in terms of risk vs. return on investment, both short- and long-term. Typically, information management projects are justified on the basis of a long-term payback. Unfortunately, the critical factors related to assessing the risk of a project are seldom considered. This results in risk never being quantified, causing long-term investments to be made in information management systems without understanding the implications of those investments or the real costs involved. Focus is commonly limited to technological and programming issues without regard for basic business principles.

The first and foremost problem that must be dealt with is how to phase in a system in a manner that will best support the strategic direction of the organization. Since corporate MIS managers are usually not involved in the strategic planning process, they are often unaware of strategic direction. Therefore, these strategic issues cannot be factored into the phasing in of new information management systems. Without this knowledge, the implementation could be doomed from the start. Unfortunately, this failure is sometimes only discovered after the new information management system has been in operation for several months.

The next critical factor relates to the impact of the phasing-in strategy upon the organizational structure. Common sense dictates that monolithic solutions related to the organizational structure are rarely successful. Among the reasons for the failure of such monolithic solutions are the following:

- They require tremendous organizational commitment from the board level down to be successful.
- They demand a higher degree of consensus among all the organizational entities involved.
- They take a long time to effect.
- They challenge the very foundation of the organization itself.

After all, the purpose of these information management systems is to support the business functions — not for the business functions to support the information management systems.

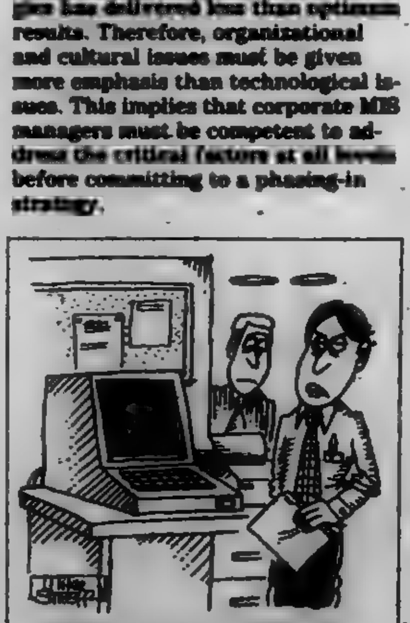
After resolving the strategic and organizational issues, cultural critical factors must be addressed. Given that the phasing-in strategy supports the strategic direction and does not severely impact the structure of the organization, the impact on the functional users of the information management system must be considered. Even the best-built information management system will fail if not embraced by the users. Therefore, the phasing-in strategy must take into consideration how to institutionalize the information management environment among its users.

The final critical factors are technology-oriented. These break down into two major categories: data base issues and equipment and software issues. The data base becomes the foundation for any information management system. It dictates how the data is inherently organized and, therefore, how it can be accessed, manipulated and extracted. Restructuring data bases is not a trivial process. Any successful phasing-in strategy must take into consideration the structural relationships of the entire information management environment.

Equipment and software issues include such things as languages, data base management systems, networking, telecommunications, hardware and so on. Proven technologies are those that have been successfully used and deployed within the public sector. Strategies that incorporate leading-edge technologies that do not fall within the definition of "proven" threaten the feasibility of a phasing-in strategy. Considerations such as industry support and direction, product reliability and vendor stability must be given careful consideration when leading-edge technologies are incorporated into a phasing-in strategy.

> *The first and foremost problem that must be dealt with is how to phase in a system in a manner that will best support the strategic direction of the organization.*

In summary, a good phasing-in strategy should have a self-testing mechanism to monitor its performance against the critical factors. The traditional technological focus for approaching phasing-in strategies has delivered less than optimum results. Therefore, organizational and cultural issues must be given more emphasis than technological issues. This implies that corporate MIS managers must be competent to address the critical factors at all levels before committing to a phasing-in strategy.



'The computer is down again.'

Imagine.™ Expand the way you think about information retrieval. It's the only query and reporting system built for CICS with: Entirely menu-driven architecture • Integrated on-line and batch query and report writing • Comprehensive system-managed control of CPU resources and data security. • Integration of production files into an on-line informational data base. For more information, call (617) 547-8050.

COMMUNICATIONS

New satellites may be fixable

DATA STREAM
[illegible]
CW Senior Editor

The recent rescue of two stray communications satellites by the space shuttle *Discovery* verifies the technical feasibility of recovering communications satellites to retrofit them on Earth and hints at the future capability of repairing satellites in space.

Space-walking astronauts Joseph P. Allen and Cmdr. Dale A. Gardner left the confines of *Discovery* on its latest mission to wrestle two satellites — the 1,200-lb Indonesian *Palapa* satellite and Western Union Corp.'s *Westar 6* satellite — into the shuttle's cargo bay.

Using the craft's mechanical grappling arm and some perseverance, the astronauts bested a design oversight that left useless a mounting bracket manufactured for the rescue of the *Palapa* satellite and manhandled that bird into its nest. The recovery of the *Westar 6* was less problematic.

Both satellites have been floundering at low altitudes since their payload assist modules failed to elevate them to the necessary 22,300-mile orbit after being launched on a previous shuttle mission. In this low altitude, the satellites were impossible to use. At the proper 22,300-mile altitude, satellites obtain what is known as a geosynchronous orbit — synchronized with the Earth and appearing from the ground to be stationary. This makes the satellites available for constant use.

Using the satellites' apogee kick motors and their reaction control systems, both crafts were lowered from the 600-mile orbit they had achieved to within the 300-mile orbital ceiling of the shuttle.

It is this altitude limitation that restricts the shuttle from being used to rescue existing communications satellites that are reaching the end of their roughly eight-year life span.

The shuttle's range of flight is determined by the amount of fuel the craft

See FIXABLE page 80

T1 system controls net parameters

IDNX allocates bandwith, reroutes clogged circuits

By James Connolly
CW Staff

NEW YORK — Network Equipment Technologies, a California-based manufacturer, recently announced its first product, a communications processor meant to be used with wideband T1 carrier facilities that incorporates automated network management.

The Integrated Digital Network Exchange (IDNX), announced here, was designed to manage digital T1 1.54M bit/sec lines carrying voice, data and video transmissions.

A key feature of the system is its ability to allocate bandwidth dynamically to voice, data and video circuits on demand and according to priorities. A company spokesman said that, for example, the system can carry large amounts of voice traffic during the day and automatically reallocate bandwidth to transmit greater amounts of data at night when the voice demand lessens.

Now installed at beta test sites and scheduled for January deliveries, IDNX also features dynamic alternate routing of circuits when an original route becomes congested or fails. Previously, that capability had been available only to public telephone companies, not on private nets.

To improve voice throughput, IDNX is said to use adaptive differential pulse code modulation to compress standard 64K bit/sec voice transmissions to 32K bit/sec and digital speech interpolation to produce an additional 2:1 compression ratio.

Digitized voice input is directly from D3/D4-compatible channel banks or digital private branch exchanges (PBX). The company said it is compatible with all major digital PBXs.

Gandalf Data adds PACX 2000

Network switching system links workstations

WHEELING, Ill. — Gandalf Data, Inc. has announced PACX 2000, a distributed networking switching system introduced as part of its Pacxnet family of products.

PACX 2000 is said to be software controlled and designed to handle all of the networking requirements of intelligent devices such as personal computers and word processors. Operating as either a local-area network or wide-area network, it ties together workstations so they can communicate with each other and links groups of workstations in one center to another center or to the corporate mainframe, the company said.

The PACX 2000 is based on 16-bit microprocessors and employs some fiber optics. Reportedly, the device handles a standard data rate of 64K bit/sec, up to 19.2K bit/sec for asynchronous data and is transparent to data speed and code. The switch is said to allocate switching capacity based on demand.

According to Gandalf, the PACX 2000 features a menu-driven console control; network configuration flexibility; messaging to inform users of network changes; a continuous activity log for network usage analysis; and on-line maintenance.

It handles a maximum of 896 lines and costs about $195 per connection, according to the vendor.

Gandalf Data is located at 1019 S. Noel, Wheeling, Ill. 60090.

GTE Telemessage linked to text messaging services

STAMFORD, Conn. — GTE Corp. has announced that it is interconnecting its Telemessage voice messaging service with its Telemail electronic mail service and other text messaging services.

The connection will allow Telemessage users to deliver messages in printed form, as well as by voice, according to the company.

Conversion of voice messages to text will allow the message to be delivered to data terminals, word processors and personal computers. In addition, Telemail subscribers will have the option of having their text messages converted to voice form.

GTE's central Telemessage system will handle the conversion, polling incoming subscriber mail every hour for messages requiring conversion, the GTE spokesman said. The conversion process will be through computerized voice-to-text and text-to-voice processes. The converted message will then be routed to the appropriate electronic mailbox for the recipient to review, redirect or save.

GTE now has Telemessage service centers in Dallas, New York and Los Angeles, and plans to open centers for Boston, Chicago, San Francisco and Washington, D.C., before the end of 1984.

Voice-to-text conversion costs $4 per 400 characters, and text-to-voice conversion costs $2 per 400 characters.

GTE, One Stamford Forum, Stamford, Conn. 06904.

Distributed Logic unveils multiplexing subsystem

ANAHEIM, Calif. — Distributed Logic Corp. has introduced an asynchronous communications subsystem designed to permit Digital Equipment Corp. computer users to multiplex from 16 to 128 local or remote communications devices.

The Optimux/32DMF+ is said to be a self-contained system expansion unit with its own 20A power supply, cooling fan and four printed-circuit card slots. It is intended for use with DEC PDP-11, VAX-11 and Decsystem-10 computers.

The basic configuration includes a single Optimux/16DMF+ asynchronous communications controller and a distribution panel for connection of up to 16 lines.

The subsystem offers a switch-selectable choice of DEC's DMF32 or DH11/DM11 protocols. Throughput is enhanced by the unit's capability for bidirectional flow control and its multiword direct-memory access burst mode, according to the vendor.

It offers software-selectable data transfer rates from a minimum of 50 bit/sec to 38.4K bit/sec.

It may be rack-mounted in 19-in. cabinets or packaged in a 3¼-in.-high enclosure. It is cabled to the DEC Unibus, allowing daisy chaining of multiple controller boards and lines for connection of up to 128 lines.

The rack-mounted version with a single Optimux/16DMF+ controller and distribution panel costs $4,500.

Distributed Logic, 1555 S. Sinclair St., Anaheim, Calif. 92806.

IDNX

from page 77

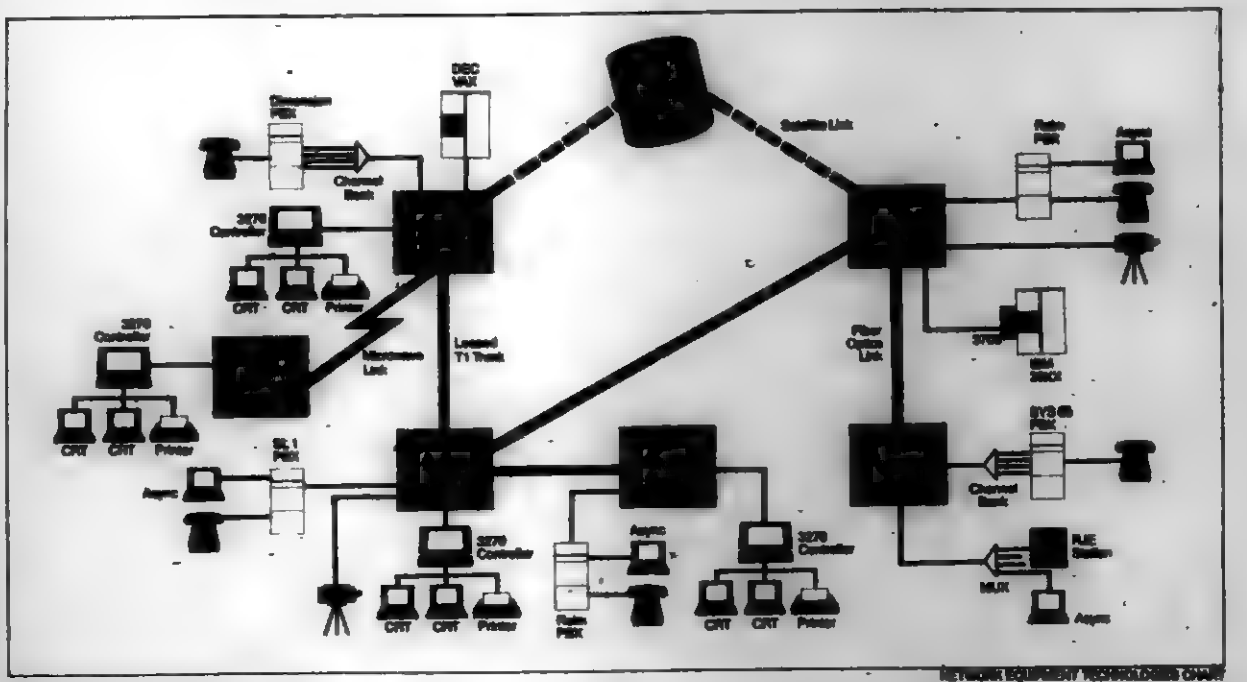
The system, targeted at large corporate T1 networks, can support up to 32 T1 trunks, with 768 addressable ports — 512 of which can be active simultaneously.

The company emphasized IDNX's flexibility, saying that it can be configured in many topologies.

The company emphasized the system's flexibility, saying that it can be configured in many topologies, including point-to-point and fully meshed networks, with each node connected to several other nodes.

Networks reportedly can be designed for the individual customer's needs, and the IDNX can be instructed to manage the network according to the customer's specifications. One such instruction could be analysis of the noise levels on a circuit and the automatic rerouting when the noise becomes excessive, a spokesman said.

The company said the IDNX includes redundant modules for all hardware whose failure could result in a node or trunk outage. Switchover to redundant hardware is said to be automatic, and installation or replacement of circuit boards in the refrigerator-size box reportedly can be done without interrupting service.



NETWORK EQUIPMENT TECHNOLOGIES CHART

Possible IDNX configuration

The IDNX is intended to replace less intelligent T1 multiplexers and is said to be compatible with T1 products and services from AT&T, the regional telephone holding companies and other common carriers. It was designed to interface with private digital microwave radios, fiber-optic and coaxial cables and satellite earth stations.

The data ports are said to support standard interfaces such as RS-232C, V.35 and RS-422/449 at synchronous rates from 1.2K to 1.34K bit/sec.

One beta test site user, Robert Anderson, assistant vice-president for telecommunications at Bankers Trust Co. in New York, said his company is using three IDNX nodes in a 60-day test. He said the test, which was half complete when the product was announced, is still at the evaluation stage and that his technicians have been examining the product's ability to withstand replacement of boards and changes in the network.

A Network Equipment Technologies spokesman said the IDNX operates at the physical link layer of the International Standards Organization Open Systems Interconnect model, transferring bits transparent to protocol between computers.

Pricing is based upon the configuration desired, ranging from $40,000 to $150,000 per node, with a typical customer paying $90,000 to $100,000 per node. Network Equipment Technologies is located at 1060 Marsh Road, Menlo Park, Calif. 94025.

Before you applaud IBM's song and dance for the 3725 Communications Controller, talk with Centron DPL about your 3705.

Your 3705 is a tough act to follow.

Chances are good that your 3705 will fill your needs at considerable savings for some time to come. Centron DPL has the hardware, technical services, and financial expertise to coax an encore from your 3705.

Add memory up to a megabyte.

You still have the option to upgrade to 512K using IBM memory, but the 3705 was built with the potential for even more. Centron DPL will build your 3705 memory up to a *full* megabyte.

Add an expansion frame to increase the number of available lines.

In many ways, your 3705 is more flexible than a 3725. It allows you to add lines as you need them, and you can continue to run asynchronous lines.

Centron DPL has model upgrades and expansion units in stock for immediate delivery at significant savings.

Lease a communications controller from the company that understands your need for flexibility.

Centron DPL will write a lease that fits your requirements; whether it's a purchase/leaseback, a lease for additional features or upgrades, or a short-term 3705 lease interim to your 3725 acquisition.

Since we maintain control of the lease, you can upgrade or add features of any size at any time. The rates for upgrades can be set in advance to offer you price protection.

We support our leases with an extensive inventory of features and upgrades, our *own* technical services division, and a complete refurb center.

Discuss your 3705 with one of our representatives today. We'll show you that it may be too early to let the curtain fall.

MAKE YOUR 3705'S PRICE/PERFORMANCE AN ENCORE.

Centron DPL Company

Only Answer/DB connects all these dots.

The more mainframe access you give your users, the happier they'll be.

They'll be more productive, too.

Answer/DB® is fast becoming the industry standard for universal data access. It addresses every mainframe file with a single, easy-to-learn language.

Users can get answers to simple queries on-line. It makes them more efficient, and your company more competitive.

Answer/DB operates in OS and DOS, interfacing with all database structures—in TSO, IMS/DC or CICS environments.

Users can integrate data from several files and generate detailed reports and inquiries—without DP help.

They can even download data to personal computers, where they can use it in the familiar PC programs they already know. Answer/DB interfaces with LOTUS™/Answer™, dBASE™/Answer™ and VisiAnswer™.

Answer/DB frees DP staff from routine tasks and request bottlenecks. But it keeps control of the mainframe resources and complete security at the DP level, where it belongs.

If you'd like to sample Answer/DB, without the pressure of a presentation, mail this coupon. We'll send a demonstration package, free of charge.

In less than an hour, you'll see that Answer/DB is powerful enough to deliver all the data your users need.

Yet so easy, it's almost child's play.

Yes, happier users sure would be nice. Send me a free Answer/DB demo package.

Datapoint offers support for three IBM micros

SAN ANTONIO — Datapoint Corp. has introduced a networking product for the IBM Personal Computer AT and terminal emulation capabilities for the IBM Personal Computer and Personal Computer XT microcomputers.

The Intelligent Network Executive-PC (INX-PC) is an adapter card designed to fit in an expansion slot on the AT, enabling the user to link the micro to the Datapoint Attached Resource Computer local-area network. It reportedly allows the AT to serve as an applications processor.

INX-PC is a user-installable card costing $695 and software costing $75. PC8220 is a software package that enables IBM Personal Computers and Personal Computer XTs to emulate a Datapoint 8220 terminal. It reportedly supports both Datapoint operating systems, RMS and DOS, and gives the IBM user access to Datapoint office automation software, data processing capabilities and communications resources. The cost of PC8220 software is $175.

Datapoint, 9725 Datapoint Drive, San Antonio, Texas 78284.

CONTROLLERS

DYNA FIVE CORP.
D5-CI100-8

Dyna Five Corp. has introduced an eight-channel asynchronous communications module designed to be compatible with the Digital Equipment Corp. Q-bus.

The D5-CI100-8 serial communications interface module provides 22-bit addressing and is capable of operating at speeds from 50 to 19.2K bit/sec, according to the company.

It reportedly is software- and plug-compatible with DEC's DLJVJ1 interface and allows each channel to be independently configured.

It costs $745 and is available at quantity discounts.

Dyna Five, 12040 Western Ave., Garden Grove, Calif. 92641.

MULTIPLEXERS/ MODEMS

HAYES MICROCOMPUTER PRODUCTS, INC.
Smartmodem 2400

Hayes Microcomputer Products, Inc. has introduced a 2,400 bit/sec modem, the Smartmodem 2400, that reportedly meets the CCITT V.22 international standard for 2,400 full-duplex communications.

The Smartmodem 2400 is also said to meet the CCITT V.22 standard for 1,200 bit/sec communications and to be similar to V.25, the proposed standard for autodial capability.

According to the vendor, the device meets AT&T 212A and 103 requirements and can be switched by the user between CCITT and AT&T-compatible transmissions.

Smartmodem 2400 is said to operate synchronously at 2,400 bit/sec, 1,200 bit/sec and 600 bit/sec and asynchronously at 2,400 bit/sec, 1,200 bit/sec and up to 300 bit/sec.

It features call progress monitoring, voice/data switching and the ability to set communications instructions with keyboard commands instead of with mechanical switches. The Smartmodem 2400 also features a superset of the Hayes AT command, making it downwardly compatible with the Smartmodem 300 and Smartmodem 1200, the vendor said.

Smartmodem 2400 is priced at $899.

Hayes Microcomputer Products, 5923 Peachtree Industrial Blvd., Norcross, Ga. 30092.

FIXABLE

from page 77

carries. A National Aeronautics and Space Administration (Nasa) spokeswoman said that the agency has thought about outfitting the shuttle with additional orbital maneuvering systems to increase its range, but even then, it would only be able to reach an orbit of 600 miles.

While it was possible to pull the *Palapa* and *Westar 6* birds down from their 600-mile orbit under their own power, none of the communications satellites now in use have the necessary fuel supply to bring them down from 22,300 miles. A spokesman for Satellite Business Systems (SBS), a carrier based in McLean, Va., said that a satellite would need as much fuel to get it down from a geosyncrhonous orbit as was required to lodge it there, or the equivalent of two payload assist modules. The extra payload assist module would have to be made at the expense of satellite power and transmission capacity.

To get around this, some scientists are toying with the idea of using a "space tug," a device that would be launched from the shuttle and used to retrieve satellites, an SBS spokesman said. They estimate that such technology is still 10 years away.

By then it is possible that the satellites in orbit will have been manufactured so that they may be repaired in space, instead of having to be brought back to Earth to be retrofitted. The first satellite to be designed with this concept in mind was Nasa's *Solar Maximum*, which is used to study solar flares.

Sometime after the Solar Maximum was launched, its altitude control module failed. In April of this year, the space shuttle *Challenger* caught up with the bird, which maintains a low altitude, and swapped the bad module with a replacement component.

In the future, all domestic communications satellites may be manufactured in a similar modular manner, enabling parts like fuel pods, transponders, solar arrays and guidance components to be changed in space. This would vastly extend the life expectancy of satellites, which cost upward of $40 million or $50 million to build, and would potentially lower the cost of using satellites for long-haul communications.

SYSTEMS & PERIPHERALS

Harris releases 32-bit workstations

FORT LAUDERDALE, Fla. — Harris Corp. has announced the Harris Station 10 and Station 20 Unix-based dual 32-bit workstations, said to deliver 0.575 Whetstone millions of instructions per second processing power and incorporating the Motorola, Inc. 68010 and 68000 microprocessors.

Aimed at engineering, scientific and software development applications, the workstations support the Ethernet local-area network (IEEE 802.3) and the AT&T System V version of Unix. The workstations use multiple 32-bit very large-scale integration (VLSI) microprocessors.

The HS-10 monochrome and HS-20 color workstations operate either as stand-alone computers, graphics systems, Ethernet network nodes or RS-232 terminals for Harris superminicomputers.

Both workstations incorporate the floating-point processor and array processor options for scientific applications. A dual bus architecture reportedly enables workstation system modules to communicate with each other via the 8M byte/sec system bus, while the peripherals connect through an enhanced 6M byte/sec Intel Corp. Multibus.

Harris workstations are reportedly effective for single-user projects in CAE, research and Unix software development.

According to Harris, the single-board floating-point processor is coupled to the CPU via the 8M byte/sec bus for maximum performance. With the Ethernet option, information can be moved between workstations at a 10M bit/sec rate, the company said. Single Harris workstations or a network of workstations can be connected to Harris superminis via Ethernet with the Department of Defense's TCP/IP protocol.

A range of peripheral, memory and performance options are reportedly possible, with the 8- or 15-slot backplanes in the HS-10 and HS-20. An accelerated Intel Multibus interface in the workstations handles mass storage devices and graphics subsystems, the company said. With the multitasking features of Unix, each user can display up to 15 text windows and 16 graphics windows. The monitors feature a noninterlaced 60-Hz refresh rate.

The HS-10 features an independent graphics processor with 256K bytes of display memory on a plane of dual 128K-byte frame buffers. The HS-20 supports up to 1.2M bytes of display memory on 10 planes of dual 64K-byte frame buffers, for 1,024

Data storage: Bubble returning, optic emerging

By John Desmond
CW Staff

LOS ALTOS, Calif. — Magnetic bubble memories and optical disk technologies are capable of serious penetration into the data storage market, according to a recent study of rigid disk drives by Disk/Trend, Inc. based here.

The study, titled "1984 Disk/Trend Report," said bubble memories are now being used in many harsh environments and are being designed into selected DP systems, such as portable computers. And some nonreversible or write-once optical disks have achieved the status of commercial products, the report stated.

Write-once optical systems are capable of higher densities than magnetic recording techniques now in use, and some planned systems could provide access to a large number of optical disks under system control, with several gigabytes on each disk. While not yet demonstrated, "advocates of various types of optical disk media technologies believe that their disks will provide archival lives which equal or exceed those of magnetic media," the report stated.

Two types of optical storage systems are available: document storage and data storage. Systems for storing document images are being offered by Toshiba, Ltd. and Matsushita Electric Industrial Co. in Japan, where the report said the optical emphasis arises from the complex Japanese alphabet. While the report predicted that optical document storage will not be able to compete on a price per image basis with microfilm, it said, "The fast and convenient access to stored images provided by optical disk systems will probably create a major place for them in the emerging OA market."

Optical data storage systems are available from a variety of firms, including Storage Technology Corp. (STC), Control Data Corp., Xerox Corp., Hitachi Ltd., Toshiba and Fujitsu Ltd. The report called STC's 7600, with shipments expected in the first quarter of 1985, the most ambi-

Distinctions blurry between system types

The distinctions between types of computer systems is getting more and more blurred. These days, the way a system is marketed can sometimes be the only way to determine into which category it fits. For example, one vendor's supermini may be equivalent to another's low-end mainframe. Supermicros are meshing with the low end of the minicomputer range.

Some vendors, such as many minicomputer vendors, have targeted their products to a particular market niche. But sometimes a market niche can be broadly defined, such as general-purpose systems. This appears to be the target

Long is a project leader at AT&T Information Systems in Altamonte Springs, Fla.

Lab director predicts use of 1M-bit chips by 1987

By Charles Babcock
CW New York Bureau

UNIONDALE, N.Y. — The director of an IBM semiconductor laboratory said integrated circuits will shrink below the one micron level by 1989 or 1990, and 1M-bit memory chips may appear in workstations as early as 1987.

Cmos technology is "clearly going to be the technical choice for the future," ahead of gallium arsenide or other exotic circuits, he added.

Nicholas M. Donofrio, director of the 1,800-employee, Essex Junction, Vt., lab, which is part of IBM's General Technology Division in Burlington, Vt., told 50 members of the American Electronics Association recently that the opinions he expressed were his own, not his company's.

Donofrio was instrumental in developing the fabrication process for IBM's 64K-bit memory chips. IBM is now shipping 256K memory chips and has produced its first experimental 1M-bit chips.

He predicted 1M-bit chips are less than three years away from production, and 4M-bit memory chips will come into use as early as 1992.

When Donofrio joined IBM 17 years ago, main computer memory cost $250,000 per megabyte. Today it costs $5,000 per megabyte, he noted. Computer users have "an insatiable appetite for memory," he added, and the number of bytes per system has gone up an average of 23% a year.

Donofrio predicted that low-power, densely packed Cmos chips will eventually replace the bipolar semiconductors currently in widespread use. Bipolar chips are faster than Cmos chips but cannot be packed with as many components and have heat dissipation problems, he explained. Cmos has already started to displace bipolar technology in logic circuits, he said.

Donofrio said there has been too little investment in developing gallium arsenide for it to come into widespread use as a semiconductor before 1990.

And while some claim Cmos chips operating as superconductors at 4 degrees Kelvin could be the next technological advance, Donofrio said he refused to believe it. "I have never found a cheap refrigerator," he said, noting that the cost of supercooling offsets the gain in speed.

Donofrio also said it was unlikely that wafer-scale technology, such as that attempted by Trilogy Ltd., was a practical alternative. Many interconnect problems exist at the wafer level that "get out of control very quickly." But growing the chip size and putting more components on each chip was a likely alternative, he said. IBM's 256K chip is 50mm compared with 15mm to 20mm for the 64K chip.

Genigraphics terminals aid graphics design

LIVERPOOL, N.Y. — Genigraphics Corp. has announced three terminals, based on Digital Equipment Corp. microcomputers, for use in designing high-quality presentation graphics for 35mm slides, view graphs and transparencies. The terminals are the SG1, 100D-Plus and SG2.

The SG1 is based on the DEC Micro/PDP-11/73 with 512K-byte main memory, the RSX-11M operating system, 31M-byte Winchester disk drive and dual 5¼- and 8-in. floppy disk drives. The SG1 comes with an ergonomically designed display with 576- by 768-line resolution.

The SG1 also comes with a palette of more than 16 million colors, three-page artwork with 256 colors per visual and 12 fonts. A communications feature enables users to transmit graphics to Genigraphics film recorders for production as 2,000- by 2,000-line or 4,000- by 4,000-line slides.

The price for SG1, with 12 fonts, Drawing Tracing Feature software and Extended Artwork software, is $95,000, the vendor said.

Six-font model

The 100D-Plus, also based on the Micro/PDP-11/73, comes with six fonts, and the Drawing Tracing Feature is optional. The product also features 5¼-in. floppy disks. Other features are said to include continuous control of hue, chroma, value, size and position; automatic justification; continuous zoom; automatic data plotting for pie, line, bar and area graphs; and file management for reading, writing, adding, reviewing and copying records. The price for the 100D-Plus is $72,000, vendor said.

The SG2, based on the Micro/PDP-11/23+, is offered with a 512K-byte main memory, 10M-byte Winchester disk drive and dual 5¼-in. floppy disks. An 8-in., single-drive floppy is optional. The price for the SG2 is $35,000, the vendor said.

All of these products are scheduled to be available in December 1984, according to the vendor.

More information is available from Genigraphics, 4806 W. Taft Road, Liverpool, N.Y. 13088.

Lisp compact announced

LOS ANGELES — Lisp Machine, Inc. has announced Lambda/E, a compact Lisp machine designed for expert systems and artifical intelligence software development. Lambda/E is the seventh member of the company's family of Lisp machines.

Lambda/E reportedly features a 32-bit Lisp processor, 128M bytes of virtual address space, a 17-in. 1,024- by 808-pixel monochrome display, 2M bytes of physical memory and 140M bytes of hard disk memory.

Other options include memory boards, a 60M-byte cartridge tape drive and an interface to the Ethernet local-area network.

Lambda/E costs $52,500, the vendor said. Deliveries are scheduled for the second quarter of 1985.

More information is available from Lisp Machine, located at 6033 W. Century Blvd., Los Angeles, Calif. 90045.

TURNKEY SYSTEMS

OPTICAL BUSINESS MACHINES, INC.
Dataflex

Optical Business Machines, Inc. has announced a superminicomputer-based system called Dataflex, built around the Perkin-Elmer Corp. Series 3200 superminicomputer.

Dataflex is intended for sophisticated, time-sensitive applications in commercial and government environments, according to the vendor. Typical Dataflex applications are said to include piecework payroll, time and attendance recording, subscription fulfillment documents, turnaround billing applications, surveys and various typewritten documents.

The 3200 reportedly has the capability to process multimedia data input from optical character readers (OCR), bar-code wands, hand-held OCR wands and direct data capture equipment such as cash registers, electronic [illegible] and instrumentation devices under applications software control. Another feature in-

For accurate communications revved up to 2400 bps, you need an expert in the driver's seat:

DataComm 2412.

In the race for the fastest, most accurate communications here's a sure winner: the new DataComm 2412 full duplex dial-up modem.

The DataComm 2412 really knows the road. It transmits miles of information in record-breaking time. It speeds error-free data over switched networks at 2400 bps -- twice as fast as 212 modems. And because transmission time is cut in half, it dramatically reduces phone costs.

At accelerated speeds, DataComm 2412 can access packet switching networks, graphics terminals, and remote databases. It can also link minis to a mainframe computer.

Features of the DataComm 2412 include: a 30-number auto dial, log on feature; an auto adaptive equalizer; and an optional plug-in ARQ module that automatically detects, corrects and assures error-free data.

To put your communications on a faster track, rev up to 2400 bps. With the new DataComm 2412. For information about this, or any of the other winners on the GDC team, contact our Sales Department, General DataComm Industries, Inc., Middlebury, CT 06762-1299, (203) 574-1118.

General DataComm

TARGET

from page 81

market for IBM's Series 1 and Digital Equipment Corp.'s VAX-11/780.

Machines may be targeted for scientific or commercial applications, as are the Hewlett-Packard Co. HP 1000 and HP 3000, respectively. Some minis are positioned for specific applications like laboratory instrument data collection, manufacturing, robotics, medicine or office automation.

Matching the application

While a general-purpose machine is generally a safe choice, it may not be the one most suited to a particular application, nor the most cost-effective. Scientific machines are classified as such for their number-crunching ability and support for laboratory devices. They are appropriate for applications that have a tendency to become CPU-bound, such as statistical modeling, simulation and research applications.

Commercial machines are noted for their capacity to handle transaction processing or I/O-bound operations and perform well for such applications as billing and inventory. Machines targeted for business applications may come bundled with application-specific software or equipped with specialized hardware interfaces. Third-party vendors offer minicomputers packaged as turnkey systems that they will maintain and update.

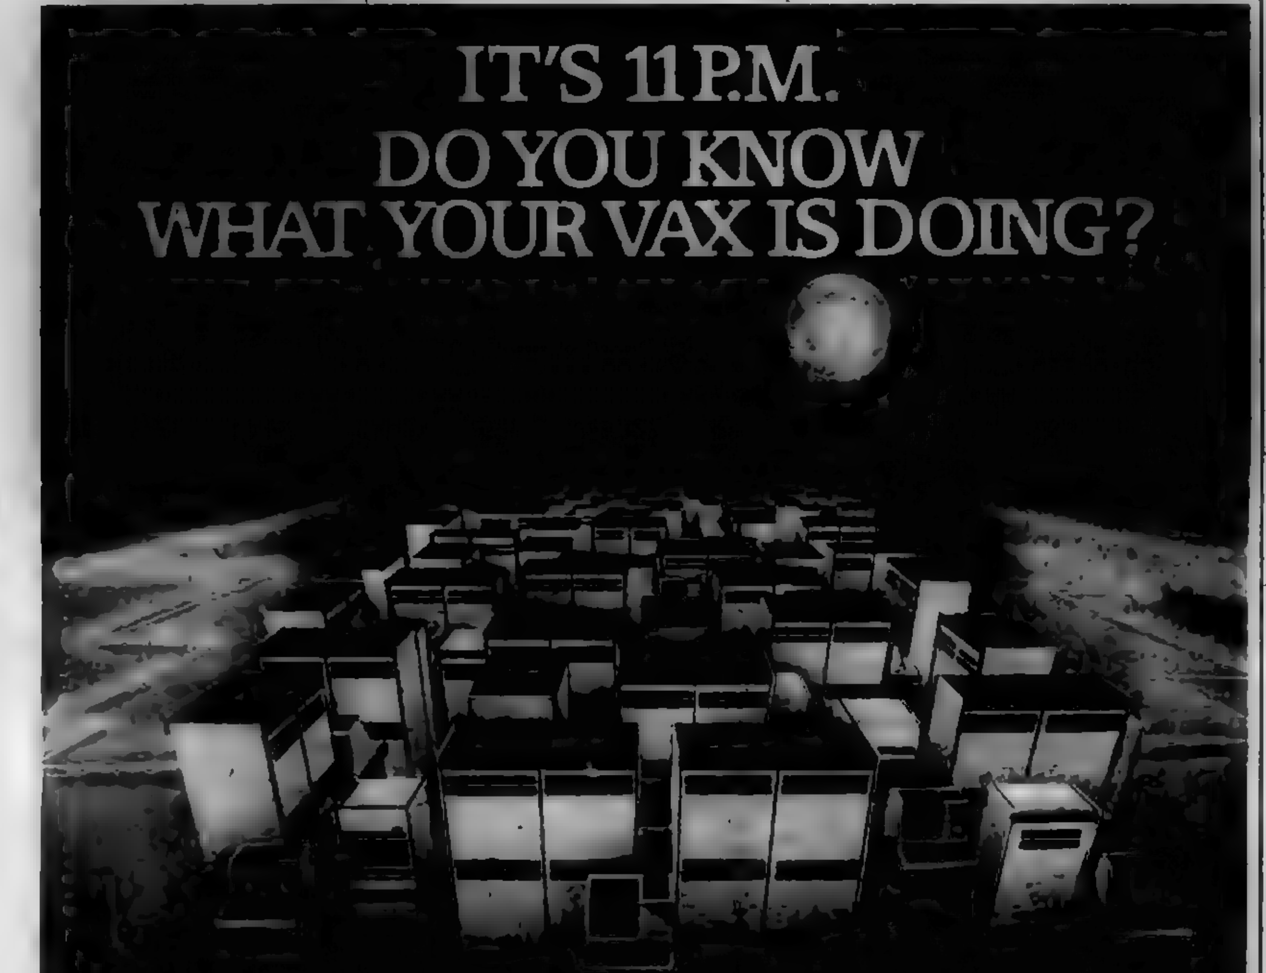
The goal of any data processing application is to meet users' needs. This is only possible when the hardware and software used for the system are equal to the job. Hardware and software that fit the applications for which they were intended are also a real morale boost for system programmers and analysts. The only way to prevent such a catastrophe is to know the application and the hardware well.

The following are some suggestions that will help to determine whether a particular machine meets particular requirements.

- Identify current application requirements in terms of the maximum number of concurrent users, required response times, size of the largest data base, size of the largest disk file, size of the largest program, interface requirements to other hardware and required software such as compilers, utilities and vendor-supported application packages. Be sure that the application planned for the minicomputer is not really a job for a mainframe.
- Project the growth of the application. Does the vendor offer upward compatibility or will the choice to be made now imply a costly conversion in the future?
- Compare the functionality with cost. Know what is available on the market that meets the requirements.
- Know the training requirements for users and DP personnel. Calculate the costs in terms of time and money. If possible, match the machine software to the skills of existing personnel. Users generally are more satisfied if they can solve some of their own DP problems rather than contribute to the existing application backlog.
- Consider the level of vendor support required and whether the vendor will be able to provide it. A vendor's reputation for support is not always consistent across all geographic locations. If you are running a 24-hour-a-day operation and production is dependent upon the uptime of the machine, be sure that you can depend on the vendor for parts and service 24 hours per day.
- When you have narrowed your choice to several pieces of hardware, request a benchmark. Benchmarks do not necessarily have to be difficult to construct. In lieu of a benchmark, ask the vendor for references of companies that are using his equipment in a way similar to the one in which you plan to use it.
- Does the system meet all or most of the requirements? Are the needs that it does not satisfy noncritical to the applications? One way to decide this is to prioritize the requirements in categories.
- Can the vendor meet the delivery date? Will the machine be installed soon enough to meet the company's business needs? The second or third best machine in terms of meeting the requirements may turn out to be the optimal choice if the vendor of first choice cannot respond to needs quickly enough.
- Do not choose a computer system because of a positive bias for a favorite vendor. Blindly purchasing from a familiar vendor may not always result in the effective solution of a business problem.
- Do not take sales brochures at face value. A system that is advertised to support 30 users may support only 15 under certain types of applications.
- Do not use a vendor demonstration of a machine as a benchmark. Demos are designed to show only machine strengths. The best benchmarks are those that most closely approximate the job mix that will be running once the machine is installed in house.

The best overall view of machine performance will come if the benchmark is run in four phases. First, run all the jobs single-threaded on an unloaded machine. Second, run a mix of the jobs that represents the average machine load. Third, run a mix of jobs that would represent an extremely heavy load. Fourth, run as many jobs as are required to bring the machine to full-load capacity. Then compare the results of step four with figures for projected growth to estimate the lifetime of the machine.

Vendors generally have software to simulate any number of users and can help in constructing a script that will represent a particular machine load. They may be able to provide performance statistics as jobs run.



IT'S 11 P.M.
DO YOU KNOW
WHAT YOUR VAX IS DOING?

[illegible]
on your VAX like never before.

You need to know exactly how your VAX computer is being used. Who uses it. On what projects. For how long. And especially, at what cost.

PACS PLUS tells you everything. With startling ease. Precision. Simplicity.

It's the only VAX/VMS cost control software that lets system managers select, examine and edit resource data via on-screen forms and simple keypad commands.

It has an incredible report writer that allows multi-level reporting on up to 30 system variables, including node, account, project, user, session, image, etc. These reports can be used to assess system performance and simplify capacity planning.

Our original PACS™ system accounting software is found in more than 800 locations throughout the world. It's won an ICP Million Dollar Award and is even sold by DEC itself. In fact, we're the leading independent developer of VAX/VMS software.

Find out what PACS PLUS can do for you. Call our toll-free number for a free information kit. Learn how, for only $3900, you can get control of your VAX. Call today. It could be later than you think.

DISKS

from page 81

tious of these. The 7600 subsystem has a transfer rate of 3M byte/sec, the same as IBM's 3380 magnetic disk drive, the report said. STC has identified an optical storage market in data bases that are infrequently or never updated, such as stock market history and legal files, as well as a market for replacing magnetic tape for archival storage, according to the report.

Delivery of 7600

Despite the recent announcement that STC has filed for a reorganization under Chapter 11 of the Federal Bankruptcy Act, the company still plans to release the 7600 on schedule, according to an STC spokesman.

Technology for the erasable optical disk is making progress, the report stated. Most development programs involve either use of a low-power laser to change the state of an amorphous gadolinium coating on a disk or use of a polarized light to change a different type of amorphous coating from a crystalline state to a noncrystalline state.

But the first volume shipments of erasable optical disk drive systems may take another three to five years, because no firms have yet committed the heavy investment required, the report said.

Despite the loss of credibility after the 1981 departure of National Semiconductor Corp., Texas Instruments, Inc. and Rockwell International Corp. from the magnetic bubble memory market, the bubbles "now look like a product with a future," the report stated. Portable computers offer the largest potential market because the bubbles have the advantages of physical size and durability while being transported, the report suggested.

Bubble memories are also attractive in applications such as industrial control systems, robots, point-of-sale terminals, medical instrumentation, avionic systems and militarized systems, according to the report.

Other highlights

Other highlights of the report were the following:

- The most likely product to replace certain rigid disk drives is the high-capacity flexible disk drive, the report stated. The 3.3M-byte, 5¼-in. floppy media being shipped by Drivetec, Inc. and Eastman Kodak Co. are developing markets with specialized systems and as personal computer add-ons, according to the report. And such media may double its capacity to 6.6M bytes next year, with the potential for even more expansion.
- Perpendicular recording for flexible disks has the potential to increase the capacity of a 5¼-in drive to 5M to 10M bytes, the report said. Linear densities of up to 50,000 bit/in. are predicted, but media availability will be a limitation on the market.
- The use of very small magnetic particles could result in isotropic magnetic recording, in which more flux changes per inch can be obtained. Eastman Kodak's Spin Physics subsidiary is advocating this technology, the report stated.
- The potential is great for track/in. improvements. "The industry still has plenty of room for innovation in this area," the report said, since most disk drives operate below 500 track/in., and the highest performers operate at approximately 960 track/in. The report predicted that IBM will release a double-density version of the 3380 in the first half of 1985, with at least 1,400 track/in.
- Perpendicular recording, as opposed to longitudinal recording used by all disk drives today, has untapped potential. If magnetization were oriented in a plane perpendicular to the recording surface, the potential would be at least 100,000 bit/in., the report said. The Japanese are developing perpendicular recording, and CDC in the U.S. has a license for the technology.

The report on rigid disk drives, which is designated Volume I, is available for $1,015, and a report on flexible disk drives, Volume II, is available for $775. The price for both reports is $1,530. More information is available from Disk/Trend, Suite B-20, 5150 El Camino Real, Los Altos, Calif. 94022.

HARRIS

from page 81

color combinations, the company said. Six planes of display memory for 64 color combinations are standard in the HS-20.

The independent graphics processor is a Motorola 68000 microprocessor with 128K bytes of random-access memory. Each one uses high-speed direct memory access transfer to obtain graphics commands from any area within the system's memory.

Computer-aided engineering applications include two-dimensional drafting and three-dimensional design, printed-circuit board layout and routing, VLSI circuit and gate-array design, civil engineering architecture and mapping, the company said.

A stand-alone unit includes the 32-bit CPU with three RS-232 lines, 1M-byte of memory, independent graphics processor, a 50M-byte disk drive and 45M-byte cartridge tape, AT&T's Unix with Fortran 77 and C languages, 19-in. monitor and an 8-slot chassis.

The standard HS-10 includes a monochrome graphics subsystem with a 19-in., 1,024-pixel by 800-pixel monitor. The HS-20 features color graphics with a 19-in., 832-pixel by 600-pixel monitor, the company said.

Prices for the HS-10 start at $32,500, and prices for the HS-20 start at $39,000.

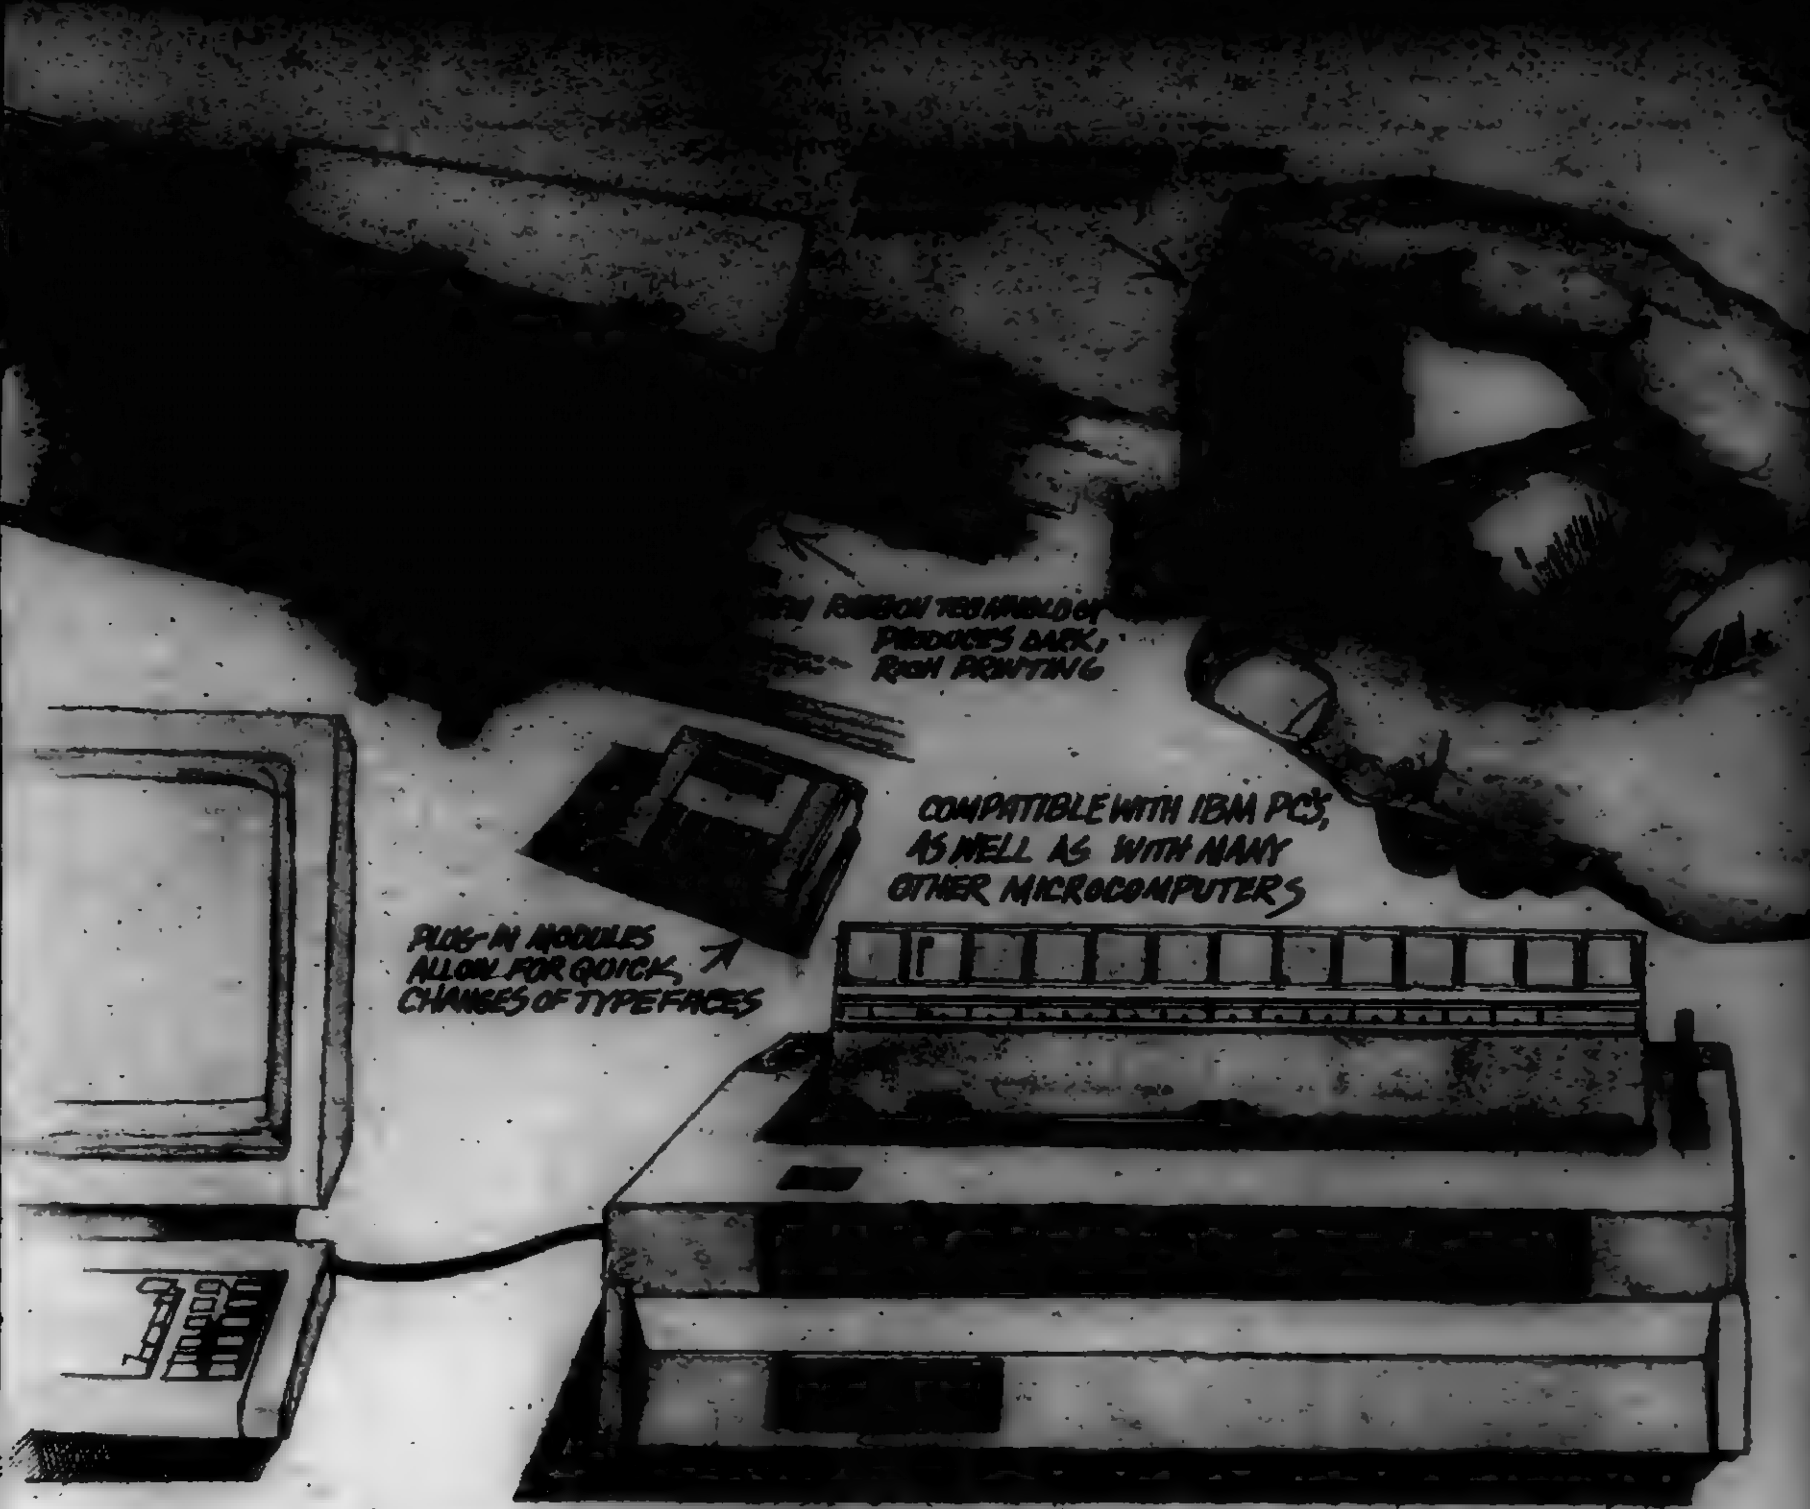
Tasty forays into the [illegible] of microcomputing, [illegible] video cassettes.



NEW RIBBON TECHNOLOGY PRODUCES DARK, RICH PRINTING
COMPATIBLE WITH IBM PC'S, AS WELL AS WITH MANY OTHER MICROCOMPUTERS
PLUG-IN MODULES ALLOW FOR QUICK CHANGES OF TYPEFACES

The new IBM Quietwriter® Printer. When letter quality should be seen and not heard.

If you're looking for a printer for your personal computer that offers quiet, letter-quality printing, look at—and listen to—the IBM "Quietwriter" Printer.

It's a technological breakthrough, featuring a new and innovative system for transferring ink to paper that makes it whisper-quiet.

But more than quiet, the "Quietwriter" Printer gives your letters the crispness of an IBM typewriter along with the deep, rich gloss of a carbon ribbon. All at up to 60 quiet characters per second.

What's more, plug-in electronic modules support the full 252-character set of the IBM Personal Computer.

You can easily attach the "Quietwriter" Printer to IBM personal computers and to many other microcomputers.

The "Quietwriter" Printer is just one example of the more than 70 printer models we build. But they all serve a single purpose: To make your printing as effective as your processing. To give your work the finishing touch.

Contact your IBM marketing representative or call 1 800 IBM-2468, Ext. 90/3T, for the IBM Product Center or authorized IBM dealer nearest you.

cludes input through manual key-entry terminals, the vendor said.

The price of the system is dependent on the hardware and software configuration needed by the customer, but it starts at approximately $100,000, the vendor said.

Optical Business Machines, 804 W. New Haven Ave., Melbourne, Fla. 32901.

TERMINALS

LIBERTY ELECTRONICS U.S.A.
Freedom terminal enhancements

Liberty Electronics U.S.A. has enhanced three of its terminals and cut the price of another terminal.

Liberty is now offering 14-in., 132-col. display options for its Ascii terminals Freedom 110 and Freedom 200 and for its Digital Equipment Corp. VT220-compatible Freedom 220 terminal, the vendor said.

Prices for the enhanced terminal options are $595 for the Freedom 110, $745 for the Freedom 200 and $845 for the Freedom 220.

The price for a Freedom 110 has been reduced from $595 to $545, the vendor said.

Liberty Electronics, 625 Third St., San Francisco, Calif. 94107.

DIPIX, INC.
Aries II

Dipix, Inc. has announced the Aries II mapping workstation for use with Intergraph Corp.'s Intergraph Computer-Aided Mapping System, said to allow users to integrate information from raster images with Intergraph graphics files.

The Aries II mapping workstation operates in three modes: tape-to-tape transfer of a graphics file in Intergraph's Standard Interchange Format from the Intergraph system to a stand-alone Aries workstation; Aries peripheral workstation interfaced to the Intergraph host Digital Equipment Corp. VAX-11 as a peripheral with direct transfer between the vector and raster data bases; and as a stand-alone Aries workstation networked to the Intergraph host allowing direct transfer of data and a distributed processing environment.

Aries II ranges in price from $35,000 in workstation mode to $100,000 as a stand-alone unit.

Dipix, Rivers Center, 10220 Old Columbia Road, Columbia, Md. 21046.

Boeing puts mainframe decision support on your desk with a difference you can see.

Now you can have large-scale decision support at your fingertips. Our Business Management Workstation combines the IBM® PC XT/370 with compatible mainframe power and our proven EIS® (Executive Information Services) software. The result is comprehensive, integrated decision support with mainframe capabilities — on your desktop.

Boeing takes another unique step, too. We equip every workstation with color graphics. You won't find this impressive capability on the standard IBM PC XT/370. It's one of the extras you get only from Boeing, an IBM Value-Added Dealer.

Of course, the PC XT/370 is itself an amazing machine. With its virtual memory capabilities, you can handle modeling and reporting locally. You can analyze and project events with expanded functionality previously reserved for only the largest computers. Yet you have the convenience and response of your own microcomputer.

Meanwhile, your decision support can take full advantage of mainframe capabilities. You can quickly access your data base on our MAINSTREAM® remote computing service with full compatibility. And you can easily transfer applications and files without the complications traditionally associated with micro/mainframe links.

The software expertise of Boeing and the most advanced personal computer ever offered by IBM are joined to give you unprecedented decision support . . . with solutions that are graphically visible.

For more information on our Business Management Workstation or the location of a sales office near you, call toll-free 1-800-447-4700. Or write BOEING COMPUTER SERVICES, M.S. CV-26-19B, 7980 Gallows Court, Vienna, Virginia 22180.

BOEING COMPUTER SERVICES A Division of The Boeing Company

Boeing Computer Services is an Authorized IBM Value Added Dealer for the IBM Personal Computer, PC XT and PC XT/370.
IBM is a registered trademark of International Business Machines Corporation. EIS and MAINSTREAM are registered service marks of The Boeing Company.

MICROCOMPUTERS

SMALL TALK
Eric Bender
CW Senior Editor

Comdex/Fall shows all

Like a national political convention, Comdex/Fall '84 dominated the local landscape, generated tremendous hoopla with a working minimum of true excitement and ended up by promising something for everyone.

Some highlights:

- This year's hottest desktop micros, the IBM Personal Computer AT and the Apple Computer, Inc. Macintosh, both received generous gifts of software and hardware add-ons from third-party suppliers.
- Lotus Development Corp.'s Jazz integrated package for the Macintosh, in beta form, looked impressive during brief semipublic showings. One potential drawback is the $4,000-plus price tag for Jazz and the required 512K-byte Macintosh with external disk drive.
- Lightyear, the decision-modeling package for the IBM Personal Computer introduced by Lightyear, Inc., also sparked a great deal of interest.

See COMDEX page 96

Traveling professionals to drive up portable use

By Kathleen Sullivan
CW West Coast Bureau

LAS VEGAS — By 1990, portable computers will play a more significant role in office automation functions as increased emphasis is placed on meeting the needs of the professional audience and automating the work of people who travel.

That was the assessment of Thomas Kinch, president of Micro Office Systems Technology, Inc., a Connecticut-based portable computer firm, who addressed a seminar on trends in the portable computer industry at Comdex/Fall '84, held here recently.

To date, the portable computer industry has focused on designing Microsoft Corp. MS-DOS and Digital Research, Inc. CP/M-based systems. But Kinch said that with developments in 32-bit Cmos microprocessor technology, the industry is "not far away from introducing [an AT&T] Unix-based portable computer."

By the late 1980s, Kinch said, briefcase-size portable computers will be able to support a Unix file server.

Stymied by design shortcomings

Gene R. Talsky, president of Professional Marketing Management, Inc., a Connecticut-based consulting firm, said the market acceptance of these hand-held machines has been stymied by a number of design shortcomings.

The screen technology used in hand-held systems, which relies on the use of LCDs, presents problems for users, Talsky said.

"If you use a portable with an LCD display for more than an hour to run a word processing or spreadsheet program, it gets very tiring," he said. Problems with glare and contrast on LCDs remain to be addressed, he said.

Weaknesses to disappear

But, according to Talsky, the weaknesses of briefcase-size portables will disappear next year.

In 1985, he said, these hand-held computer systems will be designed with advanced microprocessors, will feature better displays — including flat panels — and will provide increased memory and storage.

Lisa Williams, president of STM Electronic Corp., a California-based computer firm that sells transportable computers, said that AT&T's entry into the computer market had introduced a new factor in the industry, one that could signal a change in direction for other computer firms.

Williams said AT&T has the ability to become another industry standard setter. "Cloning IBM is not the only strategy," she concluded.

- Digital Equipment Corp. cut prices for its Rainbow microcomputer/90
- NCR Corp. announced a local-area network/91
- Alpha Software Corp. enhanced its four-function Electric Desk package/92

True Basic — from original Basic authors — gets graphics

HANOVER, N.H. — John G. Kemeny and Thomas E. Kurtz, creators of Basic in 1964, are gambling that graphics capabilities will lure current Basic users to True Basic, Inc.'s True Basic.

Last year, the authors of Basic formed True Basic, Inc. and announced plans to create a superior version of Basic. "We want to eliminate the babble of Basic," Kemeny stated.

The linchpin of their offering is its ability to support graphics. True Basic conforms to the proposed American National Standards Institute (Ansi) Basic and supports Ansi's Graphic Kernal System, a proposed graphics standard recently incorporated in a number of IBM graphics products [CW, Sept. 24].

Principal benefits that True Basic is said to provide include the ability to draw pictures without counting pixels and to recall pictures previously drawn, Kemeny said. Users reportedly can design graphs, charts, picture programs and animated displays that can be used in programs or stored in external libraries. Pictures can be changed, rotated and moved from one window to another.

The product, which combines an editor, compiler and interpreter, features English language syntax, sophisticated error-handling, on-line Help facilities, a full screen editor, windows, mouse support and programmed function keys, True Basic said.

Initially, the company is targeting educational institutes for the program. Kemeny claimed that True Basic, which requires 128K bytes of random-access memory, will be offered on a number of microcomputers, and programs written on one microcomputer can be easily moved to a second microcomputer.

The company has announced an IBM Personal Computer version with a shipping date of January 1985 and an Apple Computer, Inc. Macintosh version due in the second quarter of 1985.

True Basic costs $149.90. Addison-Wesley Publishing Co. will act as publisher, handling the two versions and related materials.

Addison-Wesley is located in Reading, Mass. 01807.

Spelling checker, text outliner introduced for Lotus Symphony

NEW YORK — For Lotus Development Corp., Nov. 12 was a day of product introductions, led by its debut of Jazz but also featuring the announcement of two software products for use with the firm's Symphony integrated package and a book.

The software products that bowed, a spelling checker and a text outliner, will each reportedly be priced at $139 and will be available in early 1985. The spelling checker, Lotus said, will allow users to compare words in a document against those in a master dictionary and will manually correct the word or choose from a list of alternative words. The text outliner, Lotus added, will allow users to switch from writing a text outline to editing the text itself. It reportedly will also create a table of contents automatically.

Also introduced was the "Lotus Guide to Learning Symphony," the first in what Lotus said will be a series of learning and application guides jointly produced by the Cambridge, Mass., software firm and the Addison-Wesley Publishing Co. The guide is priced at $22.95 and reportedly features 400 illustrations.

Lotus is located at 161 First St., Cambridge, Mass. 02142.

Corona unwraps desktop series said to be compatible with IBM

LAS VEGAS — Corona Data Systems, Inc. has announced an enhanced series of IBM-compatible desktop personal computers.

Corona's PC400 series features 640- by 400-pixel resolution, along with a 14-in. monitor. The systems reportedly provide users with the ability to run in IBM's medium and high 200-line-resolution mode or in Corona's 400-line mode, without an adapter card. Graphics adapters for the PC400 series are built into the motherboard, leaving an extra expansion slot free, Corona said.

Based on the Intel Corp. 8088 microprocessor, the PC400 series includes 256K bytes of random-access memory (expandable to 512K bytes); Microsoft Corp.'s MS-DOS and GW-Basic; Multimate International Corp.'s Multimate word processing package, and Comprehensive Software Support's PC-Tutor.

The series ranges from the Model 12, with one floppy disk drive, to the Model HD2, which includes one floppy disk drive and a 10M-byte hard disk drive. The Model 12 is priced at $2,650, and the Model HD2 costs $4,395.

Corona is headquartered at 275 E. Hillcrest Drive, Thousand Oaks, Calif. 91360.

Spreadsheets cited most used micro software

NEW YORK — Spreadsheets are the most widely used software packages among companies using microcomputers, a national survey has found. According to the National Association of Accountants (NAA), which sponsored the survey, more than 90% of the companies purchasing micros use spreadsheet software packages.

Most companies initially bought micros hoping to use them for budget and financial analysis applications, the survey said, but it noted that 64% of the respondents used word processing software; 37% had general accounting packages; and 36% used graphics packages.

The survey found that 47% of the respondents using spreadsheets used Lotus Development Corp.'s 1-2-3; 22% chose Software Arts, Inc.'s Visicalc; and 12% used Sorcim Corp.'s Supercalc.

Word processing packages

Of those companies that use word processing packages, Micropro International Corp.'s Wordstar is used by 33% of the respondents. Service industry firms use word processing packages most frequently, the survey said.

"Respondents ... were not as pleased with their word processing software selection as they were with their spreadsheet selection," according to the survey.

This may be because "most of the respondents held management accounting positions and ... do not have hands-on experience working with their word processing package."

Manual systems replaced

BPI Systems, Inc.'s General Accounting was the accounting package employed by most of the respondents, the survey said. General accounting software packages were purchased primarily to replace manual systems, according to the NAA survey. The financial sector (including banks, insurance companies, real estate firms and security brokerage firms) had the biggest users of graphics software packages, the survey said.

More than 80% reportedly used their graphics package for preparing illustrations in reports and documents, and 74% used it to prepare graphs and charts for company presentations.

IBM Personal Computers reportedly were the most used micros among those surveyed. Another system mentioned frequently was IBM's Personal Computer XT.

Majority have one micro

According to the survey, the majority of the participants had one micro and used it between 20 and 40 hours a week. Most said that both management staff and between one and three clerical personnel are trained to use a microcomputer.

Conducted in cooperation with Auerbach Publishers, Inc. of Pennsauken, N.J., the survey questioned about 500 manufacturing firms and financial service organizations employing more than 500 people and reporting annual revenue in excess of $100 million.

Answers were also received from service industry firms reporting annual revenues between $1 million and $9.9 million and with fewer than 100 employees.

Results of the survey are published in this month's edition of *Management Accounting*.

DEC reduces micro, memory, software prices

LITTLETON, Mass. — Digital Equipment Corp. has reduced prices on its Rainbow 100 and Rainbow 100+ personal computers, memory options and operating system software.

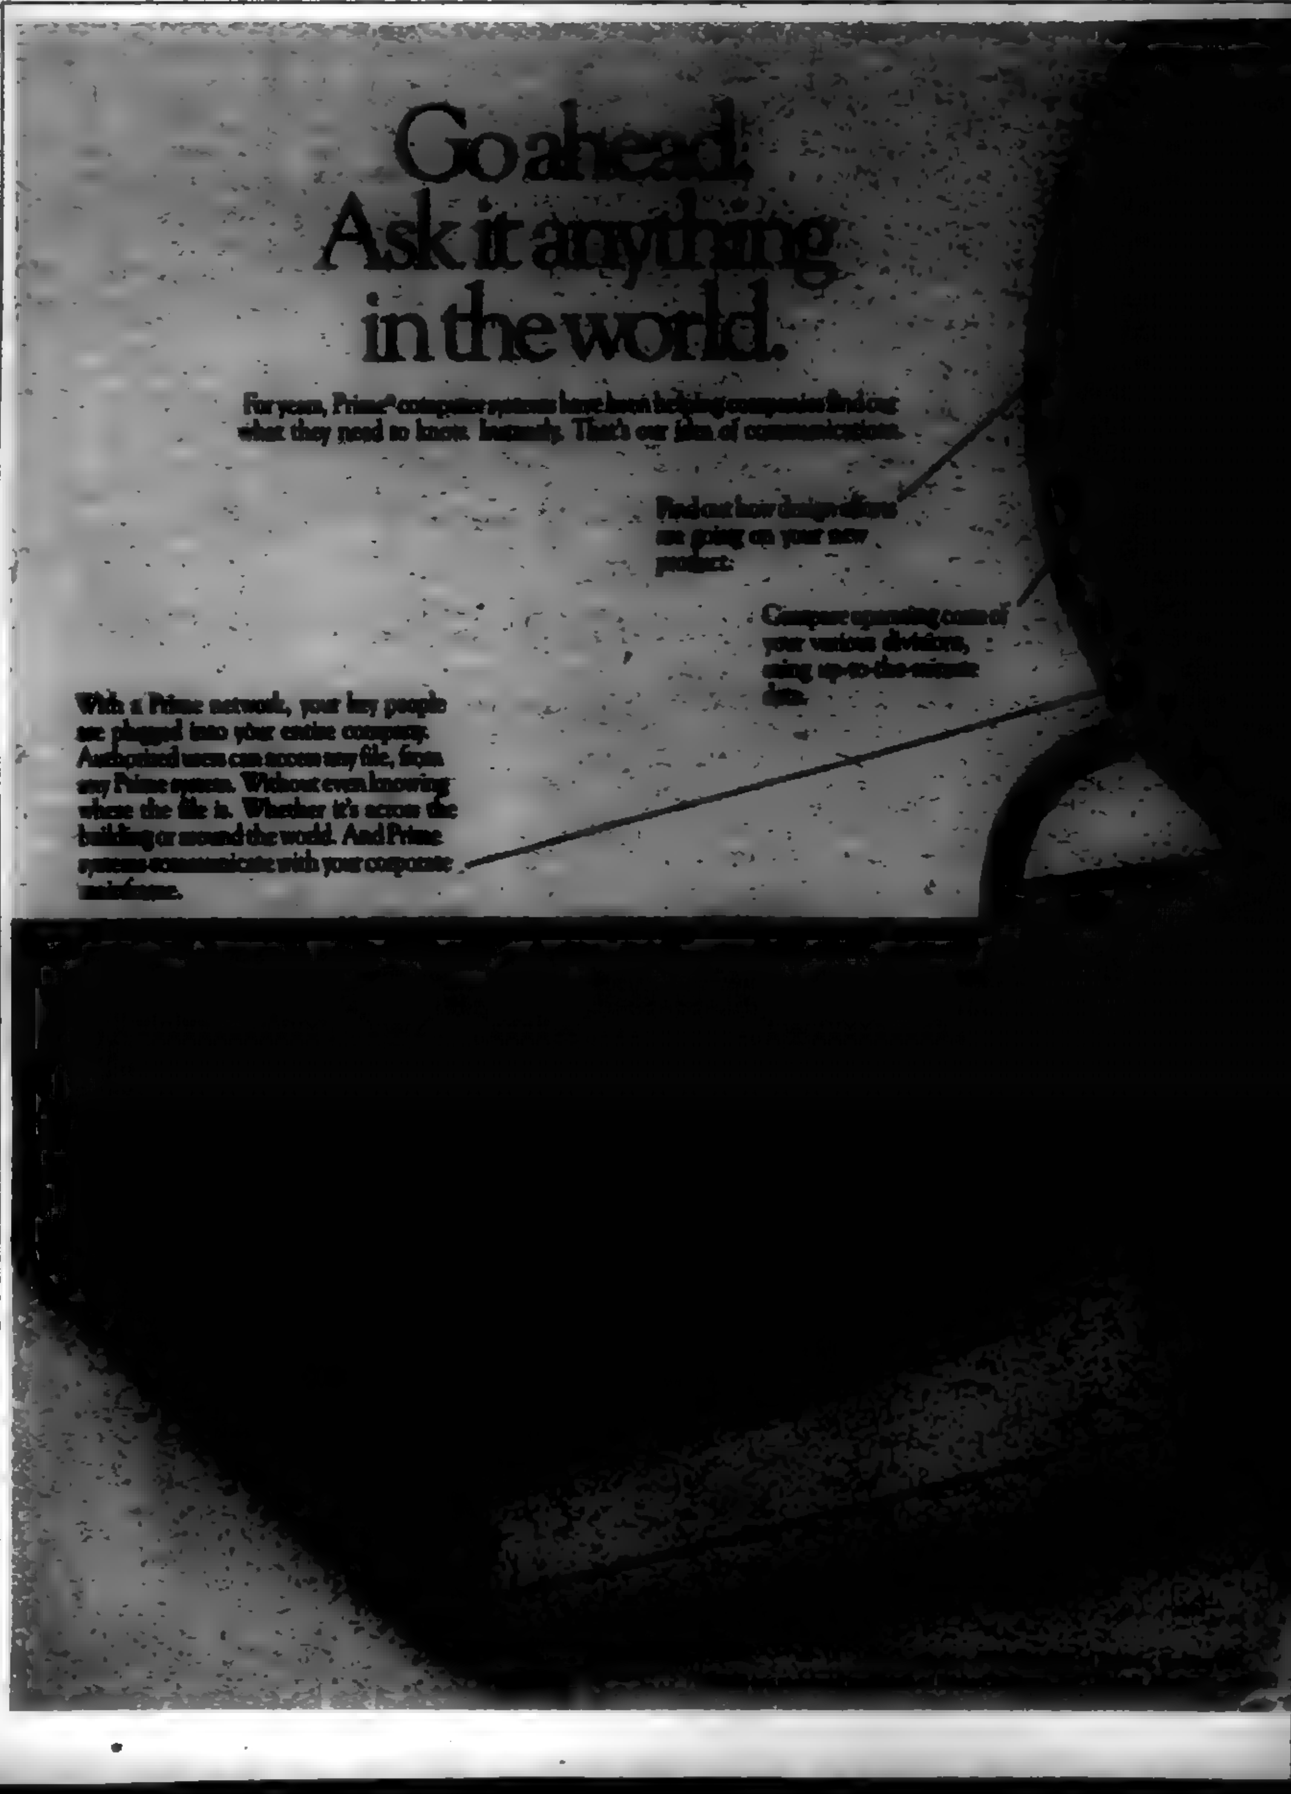
The system unit price of the floppy-disk-based Rainbow 100 with 128K bytes of main memory is now $2,415 — reduced from $2,750 — and the Rainbow 100+ with a 10M-byte hard disk is now $4,315 — reduced from $5,075, the firm said.

The price of the 128K-byte option has been reduced from $449 to $300, and the 256K-byte option has been cut from $[illegible] to $[illegible].

Prices for Digital Research Inc.'s CP/M 86/80 or Microsoft Corp.'s MS-DOS operating systems have been reduced from $275 to $95 each. The two systems can be purchased together for $175, the company said.

Keyboard and monitor prices remain unchanged, however. A typical configuration of the Rainbow 100 system with 256K bytes of memory, keyboard, monitor and choice of operating systems is now $3,380, compared with $4,044, while a similarly equipped Rainbow 100+ is about $5,289 — reduced from $6,369, the company said.

DEC is located at 146 Main St., Maynard, Mass. 01754.



Go ahead.
Ask it anything
in the world.

For years, Prime® computer systems have been helping companies find out what they need to know. Instantly. That's our idea of communications.

Find out how design efforts are going on your new product.

Compare operating costs of your various divisions, using up-to-the-minute data.

Phone management available

Packages to autodial, autoanswer, provide security and remote access

PALO ALTO, Calif. — Digital Pathways, Inc., has introduced a line of communications software that is said to allow an IBM Personal Computer XT to perform telephone answering functions.

The Soundware series of products include: Communicard, a voice communications card, telephone management software called Voicemate and programming software [redacted]

Communicard permits high-quality voice to be recorded on a hard disk, the vendor said. The card is said to require a half slot in the IBM PC XT or compatible card cage and to provide automatic Touch-Tone recognition.

Used in conjunction with Communicard, Voicemate reportedly provides an individual telephone management system with message greeting, message playback, phone directory with automatic dialing capability, password recognition, remote owner access for message playback and audit train, voice file transmission, Touch-Tone dialing and Touch-Tone decoding.

Voicemate includes a remote-access feature that allows the owner to call the personal computer and play back messages, the vendor said.

Soundtools reportedly allows users to develop their own software applications, including voice recording capabilities.

Price of the Soundware package, including Communicard, a diskette with Voicemate and Soundtools software, is $449.

The Communicard and Soundtools modules together [redacted]

Digital Pathways is headquartered at 1060 E. Meadow Circle, Palo Alto, Calif. 94303.

Macintosh Think Tank announced

LAS VEGAS — Living Videotex in- [redacted] outline processor for the 512K-byte model of the Apple Computer, Inc. [redacted] Comdex/Fall '84 show.

Peter Winer, director of new product development for the Mountain View, Calif.-based software firm, said Think Tank for the large-memory Macintosh offers the capacity to store windows of text or graphics within a Think Tank outline, something not possible on earlier versions.

Think Tank lacks built-in graphics-generation capability, Winer said, but it allows graphics to be imported from any graphics program that runs [redacted]

Like the other versions of Think Tank (for the Apple IIe, the 128K-byte Macintosh and the IBM Personal Computer) the new version of the software allows users to create an [redacted] in any order.

Winer pointed out that larger concepts are stored under main headlines and more specific concepts under smaller subheadlines, both created by the user.

A special feature of the 512K-byte Macintosh version, Winer noted, is its "slide show" function, under which users can place a series of graphics elements — including digitized pictures — back-to-back in a series and then run through them as if they were doing a slide show, with the machine's mouse acting as the remote control.

Think Tank for the 512K-byte Macintosh is priced at $245. An upgrade for users of Think Tank on the 128K-byte Macintosh is priced at [redacted]

Living Videotex is located at 2432 Charleston Road, Mountain View, [redacted]

PC2PC links compatibles

DAYTON, Ohio — NCR Corp. has introduced PC2PC, a local-area network that links IBM Personal Computers and compatible computers.

The product transforms any micro on the network into a file server and allows up to 64 machines to be connected, NCR said. It is said to operate at a transmission speed of 1M bit/sec and to allow users to share printers, hard disks and communication lines.

"This product is user-installable and the entire network can be fully operational in less than two hours," Vernon W. Yates, NCR division vice-president and general manager, said. "It uses a small number of easy-to-use commands to allow the novice and experienced user to explore the capabilities of the network."

The cost of the network is $495 per connection.

NCR is located at 1700 S. Patterson Blvd., Dayton, Ohio 45479.

SOFTWARE

APPLIED DATA RESEARCH, INC.
ADR/PC Adroit enhancements

Applied Data Research, Inc. has enhanced ADR/PC Adroit, its training system software that runs on the IBM Personal Computer with IBM's PC-DOS operating system.

The product now is able to capture mainframe screens and create corresponding Adroit text screens, according to the vendor. To complete this task, a user requires a Digital Communications Associates, Inc. Irma board that is activated by the control key, Applied Data Research said. The enhancement reportedly expedites tutorial creation when combined with Adroit's software simulation capability.

Adroit costs $4,500.

Applied Data Research, Rt. 206 & Orchard Road, CN-8, Princeton, N.J. 08540.

PRECISION SOFTWARE PRODUCTS
Keys Please!

Precision Software Products has developed a product said to increase the speed of Micropro International Corp.'s Wordstar word processing package by 20% to 40%.

According to the company, Keys Please! puts all Wordstar commands onto function keys, and all printer capabilities are automatically activated. The product comes with an on-screen reference line and a chart of commands, eliminating the need to memorize Wordstar letter codes, the company said.

An Instant Install process enables Wordstar users to change peripherals to their computer systems without having to go through a Wordstar installation process.

Keys Please! with Instant Install is available with several operating systems, including Microsoft Corp.'s MS-DOS, IBM's PC-DOS, Digital Research, Inc.'s CP/M 80 and CP/M 3.0 and Musys Corp.'s Turbodos.

The cost of the product is $69.95

Precision Software Products, Suite 204, 360 17th St., Oakland, Calif. 94612.

STRATEGIC SOFTWARE PLANNING CORP.
Promis for the Personal Computer AT

Strategic Software Planning Corp. has announced that its project management software system is now available for the IBM Personal Computer AT.

Project Management Integrated System (Promis) can reportedly handle project planning, tracking, resource management and cost control functions. The product utilizes a data base architecture and report writing and graphics capabilities.

The cost of Promis is $2,995.

Strategic Software Planning, 222 Third St., Cambridge, Mass. 02142.

MANAGEMENT CONTROL SYSTEMS, INC.
Quick-Look Version 84.01; Financial Reporting System Version 2.01

Calculations for computing income tax averaging, 10-year averaging and marriage penalty deductions are among the enhancements included in Version 84.01 of Management Control Systems' (MCS) Quick-Look tax planner package.

The software reportedly runs on IBM's System/34 and 36, Personal Computer XT and AT and System/23.

Quick-Look Version 84.01 costs $535 for the IBM System/34 and System/36 computers. The cost of the software on the Personal Computer XT and AT is $350, and for the System/23, it costs $495.

The company also announced the MCS Financial Reporting System Version 2.01 for the IBM Personal Computer XT and AT.

The product increases processing time by eliminating the need for loading a key diskette in the disk drive, according to the company. Keyboard handling has also been modified to speed up data entry, the company said.

The package requires 256K bytes of memory and a 10M-byte hard disk, according to the vendor. It costs [illegible]

Management Control Systems, 2400 Lake Park Drive, Smyrna, Ga. 30080.

See TOOLS page 94

Electric Desk gets upgrade

BURLINGTON, Mass. — Alpha Software Corp. has released an upgraded version of its Electric Desk, a four-function integrated package that runs on the IBM Personal Computer with IBM's PC-DOS operating system.

The new version reportedly supports spreadsheets up to 200K bytes in size, with improved speed in displaying spreadsheets. The upgrade also is said to add the ability to dial a phone number in the communications function without first creating a log-in script.

In addition, the enhanced Electric Desk can display foreign characters on-screen in the word processing mode, Alpha said.

Electric Desk runs with 256K bytes of random-access memory and provides word processing, data base management, spreadsheet and communications functions.

The upgrade will be provided free to current owners of the package. Electric Desk costs [illegible]

Alpha Software is located at 30 B St., Burlington, Mass. 01803.

Warm up to
PC/RESERVE™
Anytime. Anywhere. On-site or overnite.

PC/RESERVE offers prompt, professional on-site service and support by more than 1100 technicians coast-to-coast. Optional blanket coverage can protect you 24 hours a day, 7 days a week.

Or, PC/RESERVE can replace your failed equipment with an identical unit. Overnite. Nationwide. Guaranteed, whether it's IBM or any number of compatible peripherals.

PC/RESERVE saves time and cold cash. We can design an on-site/overnite program that won't freeze your budget. If you don't want the cold shoulder next time your PC goes down, call PC/RESERVE today.

We support the IBM PC, IBM PC XT, IBM Portable PC, IBM PCjr, IBM 370 XT, IBM 3270 PC, IBM Personal Computer AT™ and many compatibles.

Anytime.

SOFTWARE AG

The innovator sets the standard with perfect vision.

In the 1970's we developed a system to provide data independence—before there was such a thing as a relational data base.

Next, we introduced a high productivity programming language for developing applications in an on-line data base environment—before there was such a thing as a fourth generation programming language.

In both cases we anticipated a trend, and delivered a product to meet a need before it was even defined by the industry.

We didn't just stop there.

We recognized the importance of maximizing worker productivity at a time when others were concerned about the high cost of machines. That's why we are the first to present an integrated series of products that use the same language.

We identified the need for a high volume product for VAX machines—while most still considered the DEC-VAX equipment only for low volume, low capacity applications.

We saw the necessity of having many machines working in coordination and developed our family of networking products to support this trend.

We realized the requirement for true distribution of data, so we carefully integrated data communication capabilities with our data base software.

By listening to our users, we anticipated the growing importance of 24-hour-a-day access to data. As a result, we now offer the first nonstop data base.

Today, while others are busy putting labels on our innovations, we are quietly moving on to our next innovation. And, that's the proper plan for the world leader in advanced systems software.

How can you be sure that your company will be ready for the challenges of tomorrow? Call us today.

ANALYTICA CORP.
Reflex

Analytica Corp. has introduced Reflex, a data base management package for the IBM Personal Computer.

Reflex reportedly combines information management and analysis features and is designed for data collection and interpretation. It is said to perform traditional collection and retrieval functions. In addition, it facilitates analysis by allowing users to review information in a variety of formats and to group it to reveal interrelationships, trends and deviations, the company said.

Data reportedly can be organized in lists and tables, extracted and displayed in charts and graphs and summarized or combined using a number of built-in functions.

Reflex is said to require graphics capabilities and 384K bytes of random-access memory. It sells for $495.

Analytica, 3155 Kearney St., Fremont, Calif. 94538.

STERLING-CASTLE
The Decision Analyzer

Sterling-Castle has announced The Decision Analyzer, a decision-making software package for the IBM Personal Computer XT and compatibles.

The company said that up to five people can use the package, which reportedly makes judgments based on paired comparisons. The preferences of the decision maker on one or more criteria are combined into scores for each problem alternative or subject such as product preferences, plant sites, warehouse locations and personnel evaluations. Customers can then use the scores to determine the best course of action.

The package costs $199. Demonstration packages are being offered for $10.

Sterling-Castle, Suite 174, 702 Washington St., Marina del Rey, Calif. 90291.

LAYERED, INC.
Front Desk

Layered, Inc. has introduced a business calendar with a time accounting function for Apple Computer, Inc.'s Macintosh personal computer.

Front Desk integrates schedules in up to 15 categories, then reports or projects productivity and revenue per person or for an entire business, according to the vendor.

Front Desk can maintain employee schedules for up to 12 months and can provide time accounting information, the company said. Users can define standard hourly billing rates for each resource being scheduled. It reportedly uses the rates to calculate total revenue generated for each source.

Front Desk is priced at $149.95

Layered, 85 Merrimac St., Boston, Mass. 02114.

DURANGO SYSTEMS, INC.
RM/Cobol for Xenix 3.0

Durango Systems, Inc. has announced that Ryan-McFarland Corp.'s RM/Cobol compiler now runs on Durango's Poppy microcomputer series using Microsoft Corp.'s Xenix 3.0 operating system.

The company claimed that more than 1,500 application programs are available for RM/Cobol. RM/Cobol is now available on all Durango systems, which feature Intel Corp. 80186 and 80286 microprocessors and run Microsoft's MS-DOS and Digital Research, Inc.'s Concurrent CP/M 86 operating systems. The RM/Cobol compiler with runtime costs $1,250.

Durango Systems, 3003 N. First St., San Jose, Calif. 95134.

SYSTEMS

COMPUTER CONSOLES, INC.
CCI Personal Computer

Computer Consoles, Inc. (CCI) has introduced a desktop personal computer that is compatible with the IBM Personal Computer.

The CCI Personal Computer comes with Microsoft Corp.'s MS-DOS 2.11, Basic programming language and CCI's Officepower office automation terminal emulation package.

Hardware consists of a table-top terminal, tilt-swivel monochrome or color monitor, an Intel Corp. 8088 microprocessor, 256K bytes of of random-access memory (RAM) expandable to 640K bytes, two serial ports and a parallel port.

The desktop computer can operate as a fully supported Officepower terminal and can perform all of the OA system's functions, including integrated record and word processing capabilities, the company said.

Base price of the product is $2,500 for a single floppy disk drive, monochrome display, 256K bytes of RAM and Powerterminal emulation software. Prices range up to $5,800, depending on configuration.

Computer Consoles, 97 Humboldt St., Rochester, N.Y., 14609.

COMMUNICATIONS

AVATAR TECHNOLOGIES, INC.
PA-Plus

Avatar Technologies, Inc. has introduced a package for the IBM Personal Computer and Personal Computer XT that provides IBM 3270 terminal emulation capabilities.

PA-Plus is said to offer IBM 3278-2 terminal emulation for users requiring dial-in access to IBM mainframes.

The software is designed to be used in conjunction with the vendor's

Your Most Precious Resource

In any business, time is money! This is especially true when dealing with Data Communication Networks where system performance and RESPONSE TIME is critical to the user.

Degradation of system performance (responsiveness) is inevitable as customer work loads increase. Installing faster, more sophisticated hardware is a popular but temporary solution. It is only a matter of time until the problem reappears.

Questronics offers a solution through statistical performance analysis of your system. Over seventy-five categories of line utilization and response time information can be generated in eleven different reports (hard copy and/or data based).

Questronics model CPA/7 is setting the standard in the industry by providing vital performance statistics in the areas of:

- User/System Response Time
- Line Utilization
- Character Transmission Counts
- Transmission Errors
- Host Resident Time
- Network Transmission Time
- Polling Counts
- Poll List Wrap Time
- Histograms
- Alarm Conditions

Utilizing this information, DataCom managers can then make the crucial decisions necessary to fine tune and balance the network. Each line may also be further refined to greater efficiency, enabling planning and projection for new growth.

Call Questronics and discuss your situation on our TOLL FREE NUMBER 1-800-572-1122.

PA1000 or PA1000E protocol converters. These stand-alone units are said to allow dial-in access to both the 3270 network and a local or remote asynchronous host computer. PA-Plus provides keyboard and data management features included in the PA100 board-level emulation product, the vendor said. The product reportedly lets IBM Personal Computer users run 3270 asynchronous communications and IBM PC-DOS application sessions concurrently.

When used with PA1000 or PA1000E, PA-Plus is said to provide programmable keyboards with Help screen support, screen capture to disk or memory, multilevel password security and automatic logon.

PA-Plus costs $100.

Avatar Technologies, 99 South St., Hopkinton, Mass. 01748.

DATAPOINT CORP.
Intelligent Network Executive; PC8220

Datapoint Corp. has announced an adaptor card for the IBM Personal Computer AT that is said to enable the AT to function as an applications processor on a Datapoint Attached Resource Computer (ARC) local-area network.

The company also announced the PC8220, a software package that reportedly provides emulation of a Datapoint 8220 terminal.

The adaptor card, called the Intelligent Network Executive, is designed to fit in an expansion slot of the Personal Computer AT and is said to enable users to link their microcomputers via the Datapoint ARC intelligent network. The card is priced at $695.

The PC8220 emulation package reportedly enables an IBM Personal Computer to emulate a Datapoint terminal. Software support includes Datapoint's Resource Management System operating system. The product is priced at $175.

Datapoint, 9725 Datapoint Drive, San Antonio, Texas 78284.

PRINTERS/PLOTTERS/ PERIPHERALS

TOSHIBA AMERICA, INC.
P1351 printer enhancements

Toshiba America, Inc.'s Information Systems Division has introduced an automatic sheet feeder and bidirectional tractor feed for its P1351 dot matrix printer.

The sheet feeder is capable of handling letter- and legal-size paper and can accommodate up to 170 sheets, including letterhead, the company said.

Using the bidirectional tractor, the printer reportedly can handle superscript and subscript for scientific notion with one and multipart forms.

The printer can accommodate bidirectional printing with both scripts without speed degradation, Toshiba said.

The sheet feeder retails for $995; the tractor feed is priced at $195, the vendor said.

Toshiba America, Information Systems Division, 2441 Michelle Drive, Tustin, Calif. 92680.

BOARD-LEVEL DEVICES

STRUCTURED SOFTWARE SYSTEMS, INC.
Mass-Storage ROM for HP 9825T

Structured Software Systems, Inc. has offered Mass-Storage Read-Only Memory (ROM) for the Hewlett-Packard Co. HP 9825T desktop computer.

The product reportedly replaces the HP 98228A Flexible Disk Drive ROM and 9895 8-in. double-sided drive. It is said to plug into one of the HP micro's four expansion slots in the same manner as the HP option ROMs.

The Mass-Storage ROM also interfaces to all Hewlett-Packard disks, including the 9221 and 9122 3½-in. microdiskette drives, according to the vendor.

The Mass-Storage ROM is priced at $990.

Structured Software Systems, Box 1072, Irick Road, Mount Holly, N.J. 08060.

COMDEX from page 89

■ Simple "pop-up" packages such as Borland International's Sidekick, offering handy and easily accessible features within other applications, were the programs that came up most frequently in casual conversation. "At last I really have a reason to use [a personal computer] every day!" one user remarked.

■ With IBM compatibility a standard for most serious personal computer manufacturers, vendors increasingly are attempting to differentiate themselves once again by adding communications or graphics features or by using value-added reselling strategies. In one example, ITT launched a personal computer, called the Voice Communications PC, which was aimed at integrating voice recognition, management and synthesis features into the company's Xtra.

■ Dozens of local-area network-related announcements were scattered throughout Comdex. Speaking almost as one, network suppliers insisted that IBM's PC Network and Microsoft, Inc.'s Networks/MS-DOS 3.1 have broken the ice on software application standardization. Copy protection and licensing for network-delivered software remain major stumbling blocks, however.

Quite likely, Comdex unleashed a thousand products on a grateful world, and every last one of them was described a thousand times in exactly the same way — as a customer solution.

Introducing the QMS Lasergrafix™ 800.

Now you can bring laser print technology right to your desk for all your business and industrial graphics needs. The Lasergrafix™ 800 from Quality Micro Systems brings full bit-mapped graphics capabilities down to true desktop size. And if you thought the flexibility, convenience and economy of laser print technology was priced over your head—look down—to under $10,000.

For letter quality word processing. Bar charts. Pie charts. Even barcodes. Full bit-mapped page memory lets you mix text and graphics, different letter sizes and type styles—all on the same page—even on the same line. The Lasergrafix 800's intelligent controller takes simple print commands through your normal data stream. So your computer's memory resources are free to do other important work.

And, QMS intelligent applications firmware is standard throughout our entire growing family of electronic page printers. So your Lasergrafix 800 can be part of a print applications master plan—a plan which can include the pioneering Lasergrafix 1200 for more continuously print intensive locations.

You get whisper quiet performance. So you can place a print workstation with the efficient printing speed of eight pages per minute, almost anywhere you need one. And the Lasergrafix 800 interfaces with just about any computer system you can name. So you can be up and running in no time—in the hottest new direction in the graphics field—down. With the Lasergrafix 800 from Quality Micro Systems. Ask for a demonstration today.

___ Send me the Lasergrafix 800 Information Packet, samples of mixed fonts, graphics and everything else it does.
___ Please contact me to arrange a demonstration.

STC credit plan canceled; 1,200 layoffs announced

By David Gimes
CW Staff

LOUISVILLE, Colo. — Storage Technology Corp.'s (STC) efforts to steady its tottering business were dealt a serious blow when Chemical Bank of New York recently decided to terminate a previously announced loan commitment.

The cash infusion was badly needed by STC, which last month filed for protection from its creditors under Chapter 11 of the Federal Bankruptcy Act.

STC, a maker of data storage devices, said Nov. 16 that Chemical Bank had terminated the loan agreement in which it would have provided STC with a $150 million credit line. The loan had been subject to a definitive agreement between the companies and approval from the bankruptcy court.

In the wake of that development, STC said last week that it was further reducing its work force by 1,200, with 1,100 of those positions being taken from its Colorado facilities and 100 at its Documation subsidiary in Palm Bay, Fla.

STC's board of directors also named one of its members, Thomas F. Wands, as interim president and chief executive officer (CEO). Jesse Aweida stepped down as CEO but remained as chairman of the board.

STC said it was negotiating with other financial institutions to obtain the cash it needs to operate while it reorganizes under Chapter 11. "The company believes that it can obtain sufficient short-term financing to operate its business until its longer term financing issues are resolved," STC said in a statement.

STC gave no explanation for why the loan was terminated. Ken Herz, a spokesman for Chemical Bank, said the company would not comment on the matter. Erica Rosenfeld, a spokeswoman for Touche

'[STC] can obtain sufficient short-term financing to operate its business until longer term financing issues are resolved.'

Peachtree sale, demise refuted; retail sale eyed

Manager cites rebound, predicts profitable '85

By Kathleen Sullivan
CW West Coast Bureau

LAS VEGAS — When Larry Smart, general manager of Peachtree Software, Inc., took the podium at a Comdex/Fall '84 press conference here recently, he did not waste any time getting to the heart of the matter.

"It has been widely rumored that the purpose of this press conference was to announce the sale or shutdown of Peachtree Software," he said. [Management Science America, Inc. (MSA) had recently announced that Peachtree, its microcomputer software subsidiary, was up for sale.] "But the discussion of our death has been widely exaggerated," said Smart, who also serves as senior vice-president of MSA.

MSA, in conjunction with Alex Brown, a Baltimore-based investment banking firm, recently issued an "offering memoran-

IBM seeks mart leverage via customer revenue

By John Desmond
CW Staff

NEW YORK — Despite dramatic drops in hardware prices in the last 20 years, IBM's marketing strategy is to continue to increase its revenues from existing customers by selling them increasingly more powerful CPUs with more demanding software.

So said noted IBM consultant and author Fred Lamond, who spoke at a recent seminar here.

Lamond said the cost of main memory has dropped 600:1 in the last 20 years, based on the price for 1M byte of main memory on an IBM 2365 Model 2 in 1964 and on the same capacity for an IBM Personal Computer AT today.

To maintain revenues, IBM has had to sell its oldest customers on using 600 times the processing power, 200 times the main memory and 50 times the disk backup of 20 years ago, he said.

Lamond, who conducted a three-day seminar on alternative growth strategies for IBM users, addressed the issue of how the increased power is being used and whether users are really locked into the directions that IBM has mapped out for them.

Lamond

As IBM main memory has increased, operating systems have occupied greater capacities of main memory, Lamond noted. For example, the IBM OS/360 MFT operating system running on the IBM 360/75 occupied 80K bytes in main memory. The MVS/XA operating system running on the 3081 Model KX mainframe requires 4M to 8M bytes of main memory — an increase of 50 to 100 times, he said.

"That growth has not been done by simply adding lots of loops that don't do any work. IBM has added more functions," Lamond said. The functions added have allowed users to begin programming on-line instead of off-line and to execute instructions on-line instead of in batch mode.

Competition in the 1970s from minicomputer vendors such as Digital Equipment Corp. helped motivate IBM to aid program development, Lamond said. A 1975 survey that IBM commissioned showed that appli-

ACRS cuts, changes seen key to tax simplification

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

Generally believed to be supportive of President Ronald Reagan in the recent election, computer users and vendors may find the November ballot shockingly counterproductive to their own interests if recent reports out of Washington, D.C., are accurate.

In the traditional Washingtonian style of anonymous spokesmen and sources floating trial balloons to see how well they fly, recent press reports indicated that a key measure to any tax simplification proposal from the U.S. Department of the Treasury will be the modification or elimination of the Accelerated Cost Recovery System (ACRS).

ACRS is the bonanza tax write-down program instituted just a few years ago to substitute for the actual life depreciation method of writing off expenditures on tangible equipment and property.

Aside from election campaign rhetoric, just about anybody with a head on his shoulders must by now realize that the U.S. government needs some mechanism to relieve the astounding federal budget deficits being run up by the administration that came to town with the stated goal of shrinking the federal government.

With Reagan committed to defense spending, senators and representatives unwilling to touch popular entitlement programs and the growing federal debt taking an increasing bite just for interest payments, the moderate viewpoint is that some type of enhancements to the federal government's revenue collection are mandatory.

Because cutting ACRS is the first substantive trial balloon to be floated, it seems reasonable to conclude that flat-tax simplification is going to involve an attempt to remove what is probably the most admired, and arguably the most effective, business stimulation program in recent history.

It will affect computer industry vendors who need large amounts of capital in order to make rapid and expensive development plans to stay abreast of America's fastest moving industry. It will impact users who are now encouraged to replace older generation equipment because they can effectively recover the costs of purchase in five years. And it will impact the leasing indus-

Lack of changes in 1984 tax act leaves credit status

OUTSIDE LINES
Alonzo D. Saunders

Perhaps the biggest nonevent of the Tax Reform Act of 1984 was that no changes were made to the rules regarding software development credits. The Internal Revenue Service code says that the costs of developing computer software do not automatically qualify as a research and experimentation credit. What qualifies is "new or significantly improved" software.

Consider the quandry of Lotus Development Corp. Its Symphony product, as currently envisioned under the law, is eligible for the credit. But what about a product like [Lotus] 1-2-3? Does "significantly improved" hinder taking the credit if 1-2-3 were to become [Lotus] 1-2-3-4? A software product line extension or a product that is compatible with another is likewise on uncertain ground.

Taking the credit has a direct impact on the balance sheet, because a credit is a deduction from taxes. As Robert Langer, treasurer of Lotus, put the problem, if the credit reduces the company's tax rate from 50% to 48%, then the company's earnings are correspondingly increased. So are earnings per share and the interests of financiers and capital markets in the company.

The downside is that if an IRS audit disallows the credit, the company may find itself restating earnings. Shareholders tend not to be pleased by a downward restatement. The Securities and Exchange Commission (SEC) position on this is well taken. Investors do not know at any given moment how hard a software development company's financials are unless the company voluntarily discloses whether its accounting treatment of the credit is aggressive or conservative. Ironically, there is not a specific accounting rule applicable under these circumstances to outline management discretion or circumscribe management greed.

The Department of the Treasury has offered some guidelines. Treasury distinguishes between software developed for in-house or "management" use and in-house, "innovative" software. The former would not qualify for the credit; the latter would. Treasury also disallows credit for "customized" software but not for software sold to the public without customization. These distinctions do not seem to have been made with marketing realities in mind, so they do not clarify matters. George Yost of Coopers & Lybrand has characterized

Saunders is a Boston-based attorney with a practice that includes international marketing, antitrust issues and corporate finance.

# of software development in state of confusion

Treasury's policy in January 1984's *The Tax Executive* as a "disincentive" to software development.

The Financial Accounting Standards Board (FASB) — the major rule-making body for accountants — has recently proposed a rule that would allow certain software development costs to be treated as assets. The SEC opposes this approach on the grounds that it creates instant profits and, as discussed above, does not address uniformity in software accounting. Nevertheless, the SEC will defer to FASB, and if the FASB rule is adopted, it would become effective in December.

Congress deliberated this law for over a year, coming up with an act in two parts: the Spending Reduction Act, designed to decrease federal spending by some $13 billion; and the Tax Reform Act, designed to raise some $50 billion.

Unlike previous revenue-raising acts, this tax act was not intended to change income tax rates either for companies or for individuals. Its objective was to increase revenue by closing loopholes. The act, therefore, made significant technical changes, changes that are more subtle and less likely to have their impact felt immediately. The act also promised additional regulations in many areas, so there are auditors, lawyers, treasurers and others who are waiting for additional shoes to drop.

As we have seen, however, Congress may have been myopic by not putting these loopholes in perspective and balancing them against other, nontax policies. The result — a continuing lack of a coherent federal tax policy for the high-tech industry.

If it is said that Congress is the culprit, then it must also be said in all fairness that Congress may have done its duty as it saw fit, if not very well. Yet in the final analysis, not Congress but the industry itself must take responsibility for laws that nurtured its fragile beginnings, compensated its people, protected it (and its customers) from theft, kept its finances honest and provided incentives to be competitive worldwide.

If change or prevention of laws, which some call penalties and others call disincentives, are to be made, then the high-tech industry should read the Tax Reform Act of 1984 as a call to arms: The industry must dramatically step up its relations with the public and its liaisons with Congress. It should devise a strategy to lobby at the federal level as never before.

First, the industry should attack the serious problem posed by the lack of clarity of the software development accounting rules. Second, the industry should develop a position that will counteract the inevitable and possibly onerous coming of future IRS regulations. Allies such as FASB, the Big Eight, legal counsel and public relations counsel should be involved.

In short, the Tax Act's errors and omissions demonstrated Congress' ignorance of the realities of the high-tech industry and, sadly, also demonstrated the industry's lack of clout in the corridors of Congress. Now that the industry has seen what can occur without political diligence, perhaps it will be motivated to get organized and step up the fight for its objectives.

CESSFUL BUSINESSMAN
TOR WITH CLOUT.™

"I JUST GOT
THE BEST PRESENT
A MANAGER COULD GET."

In most companies, there's one thing managers want even more than corporate perks or bigger staffs.

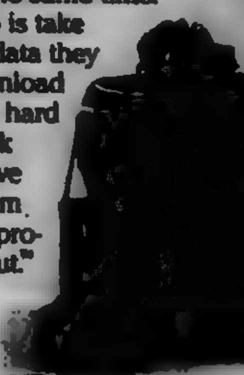
Information.

And they'll drive your whole DP staff up the wall trying to get it. They'll ask you to round up data that's scattered all through the company. Then expect you to sort it a hundred ways from Sunday. And deliver it last week.

Even worse, they'll buy carloads of PCs, then come running to you for help every time they forget how to plug one of them in.

But now, there's a way to give these global marketing heavies the answers they've been looking for. And give yourself a break at the same time.

All you do is take the mainframe data they want—and download it into their PCs, hard disks, or network servers. Then give every one of them a new software program called Clout.™ It's as simple as that.



"IT WRAPS UP
FILES FROM LOTUS 1-2-3,™
PFS:FILE,™ DBASE II,™
THE MAINFRAMES,
AND MORE."

In the past, it used to be near impossible to pull information together from different sources, without re-entering every bit of the data. But the new Clout takes data files directly from these popular programs—plus ASCII, DIF, and SYLK files, too. So users can get information from other PCs by sharing floppy disks. Or being part of a LAN. Clout can even read files that have been transmitted from the company mainframe. Or another PC.

Anytime users have a question, they just ask—in their own words! Clout will scan up to 40 of these files automatically, cross-reference five simultaneously, and there's the answer. They don't have to know exactly how the data is organized. Or even in which file it's stored. Best of all, Clout won't let these high-powered managers pollute the database. No matter how hard they try.

"NOW THE WHOLE
DP DEPARTMENT
CAN GET
A CHRISTMAS BREAK."

Clout's self-guided, step-by-step tutorial makes learning so easy, your staff will spend less time training these people. And more time on the things they do best. Like figuring out ways to improve operations. And maybe, vacationing in the Bahamas this winter.

"GIVE YOURSELF
A BONUS.
GET A DEMO TODAY."

Clout's suggested retail price is less than $300—a small price to pay for a big boost in productivity. But if you prefer we'll send you a full demo of Clout for only $6.95 (plus shipping). Just call 1-800-547-4000, Dept. 926 In Oregon, or outside the U.S., call 1-503-684-3000, Dept. 926 Or get in touch with your nearest computer or software store.

And see what it's like to wield a little Clout.

CLOUT™
FROM MICRORIM®

Requires 256K of memory. Runs on MS-DOS and PC/DOS operating systems. Hard disk recommended.

IBM users question future

Integration, ambiguous solutions raise concern

CW AT ENTERPRISE INFO SYSTEMS

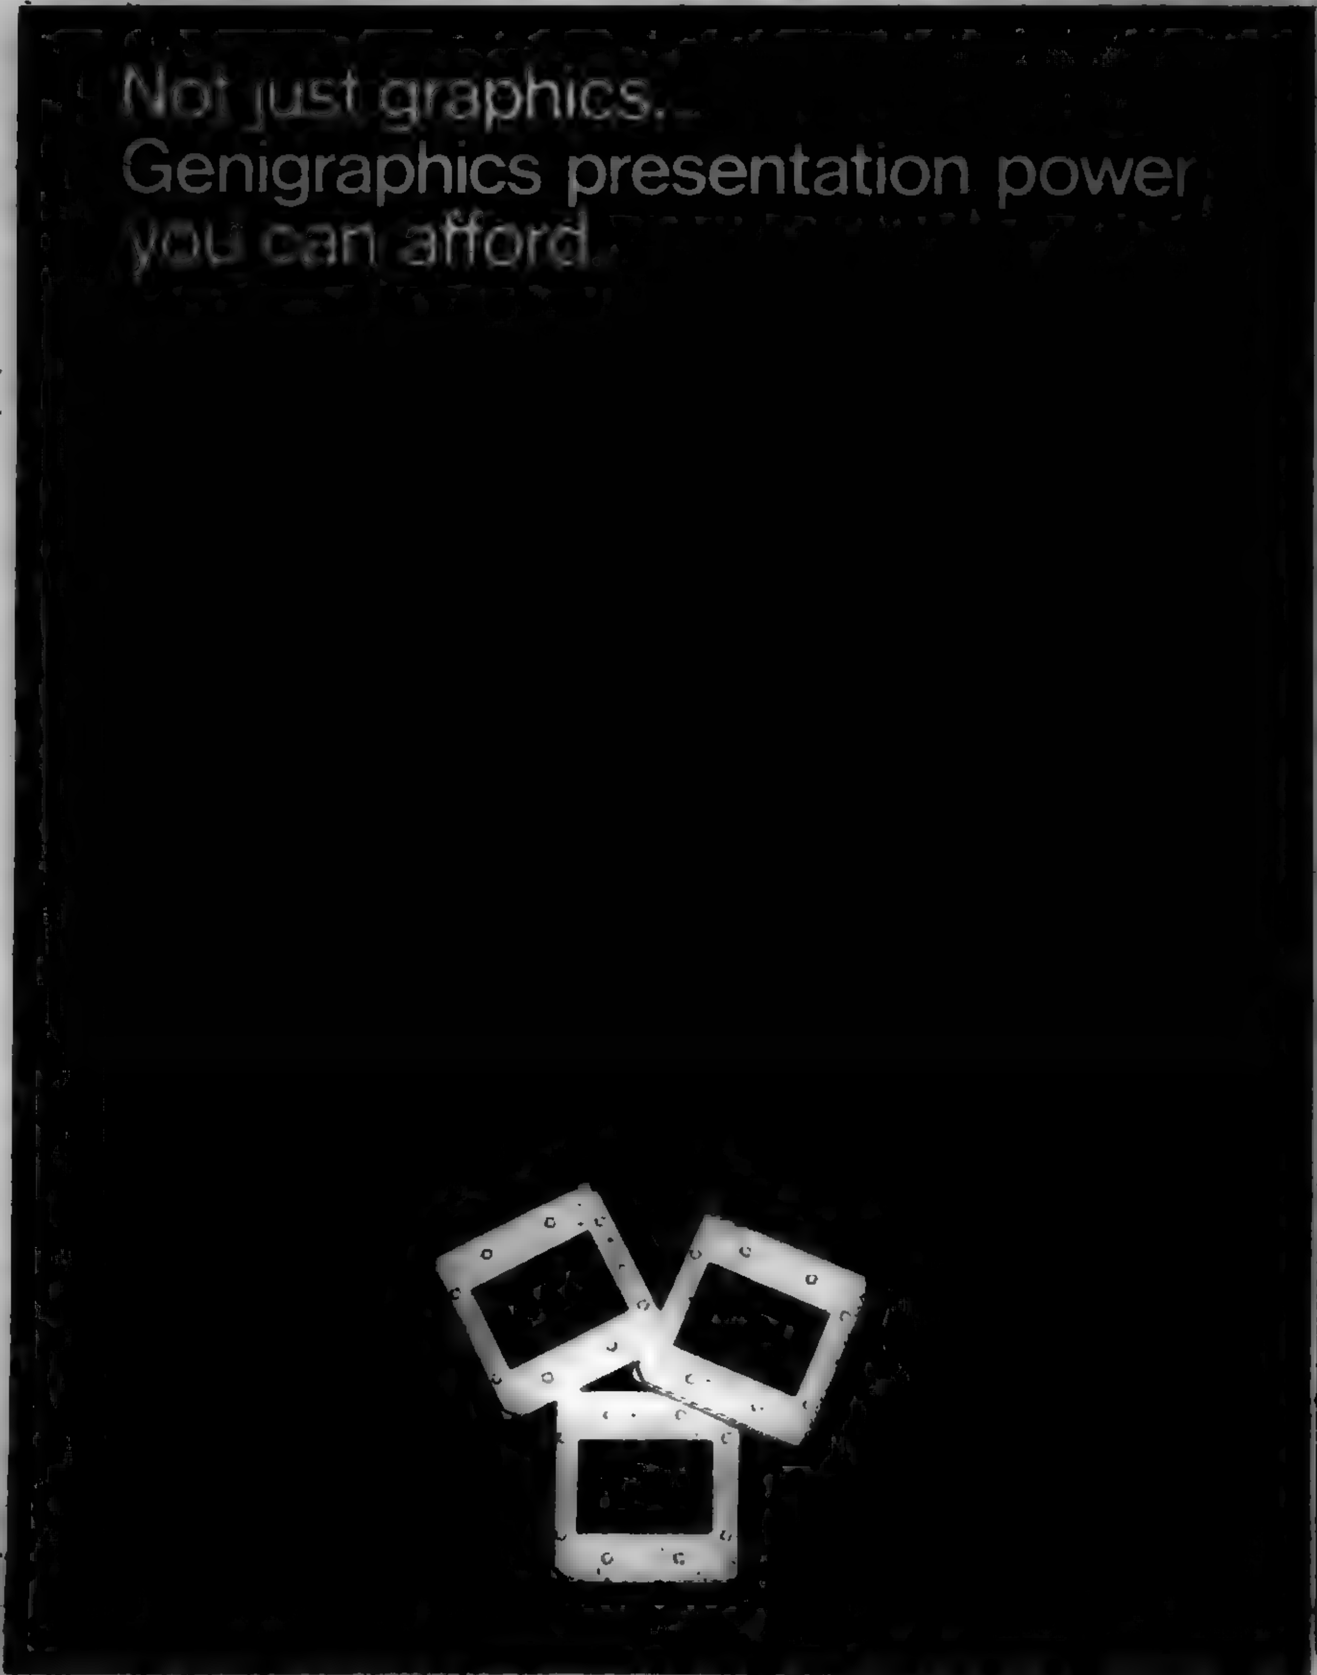
By Kathleen Burton
CW West Coast Bureau

SAN DIEGO — Concerned IBM users, trying to plot their future strategies, are questioning the company about a number of wide-ranging issues, encompassing everything from ambiguous IBM solutions to a perceived lack of integration among IBM product families.

So claimed Robert T. Fertig, president of Enterprise Information Systems, Inc. at a seminar held at the sixth annual Enterprise Information Systems forum in San Diego recently. Using results from his annual survey of more than 200 IBM users, Fertig said other user concerns centered on IBM's nebulous operating system strategy, plans for the VM/CMS environment, questions about the direction of distributed data processing and dismay over IBM's rapidly skyrocketing support costs.

Based on the survey, Fertig predicted several IBM product and strategy scenarios through 1987.

- Unlike Digital Equipment Corp., IBM will avoid providing a total integrated office automation solution. DEC's OA solution lets users move from a Microvax I and II to clustered DEC 8600s using a single operating system. This strategy makes DEC's products an obvious target for plug-compatibles, and any price/performance improvements to low-end products must also be implemented at the high end.
- IBM's popular Professional Office Systems Software (Profs) will merge with the poorly performing Distributed Office System Support (Disoss) host-based business system by the second quarter.
- IBM will develop multiple solutions and overlapping products to answer mainframe server needs. The 8100 will be enhanced to act as a file and print server in a local-area network. The 8100, 4300, System/36 and System/38 will all serve distributed processing needs. This strategy will prove expensive and confusing for users but will let IBM offer a moving target to competitors.
- IBM will announce initial models of its next mainframe family, the Sierra series, with capacities of 7.5 to 30 millions of instructions per second perhaps as early as third-quarter 1985. Offering bulk main storage, the Sierra will adversely impact IBM's existing 3080Q and KX series, offering twice as much performance for the price. The Summit series, a sucessor to the Sierra, may be announced by the second quarter of 1987.
- IBM's mid-range System/38 will merge with the 4300 line by 1986 and serve as a key departmental and host system in IBM's OA strategy.
- An 80386-based update to the Personal Computer AT will be released in 1986. The AT will continue to run both MS-DOS and Xenix, underscoring IBM's strategy of offering several solutions and letting the market decide.
- Aimed squarely at the business/professional market, IBM will announce the Crackerjack portable computer, Fertig said, by this Christmas. The 80186-based, stripped-down model will run MS-DOS, retail for $1,500, weigh less than 15 lb, have a built-in 3½-in. disk drive and an attached plasma display.



Not just graphics.
Genigraphics presentation power you can afford.

DIGITAL BRINGS VAX TO LARGE SCALE COMPUTING.

INTRODUCING THE VAX 8600 SYSTEM.

Your applications can do exactly what you want them to on Digital's new VAX™ 8600 computer system. They can expand.

User population can increase. Scientific problems can become more complex. Transaction volume can intensify. And data storage requirements can grow exponentially.

The VAX 8600 system gives you unprecedented capacity for applications growth. It's the first of a new generation of large scale VAX processors, with memory expansion to 32 million bytes and online storage up to 160 billion bytes. Yet the VAX 8600 system maintains complete architectural compatibility with every other VAX processor – including the new desktop-size MicroVAX I™ system. Every system in the family gives you the same VMS™ operating system software, with the same set of proven development tools, communications options and data management facilities. Quite simply, there's not another computer family in the world that can match the growth path you get with Digital's VAX systems.

YOU GET UP TO 4.2 TIMES THE PERFORMANCE.

We've engineered the VAX 8600 system to deliver more than four times the processing speed and performance that the industry-standard VAX-11/780 system is known for. We've achieved this performance increase through the use of ECL gate array technology and several advanced engineering techniques.

Specifically, the VAX 8600 system incorporates four-stage pipelined processing that increases throughput by allowing the system to execute one instruction while it simultaneously decodes a second, generates an address for a third and fetches a fourth. There's also a floating point accelerator that speeds floating point operations.

Even with all its power, the VAX 8600 system conserves floor space. The CPU fits into the same size cabinet as the VAX-11/780 CPU. Power consumption and air conditioning requirements are similar, too.

VAX 8600 SYSTEM HIGHLIGHTS

MAXIMUM MAIN MEMORY SIZE	32 Million Bytes
MAXIMUM STORAGE CAPACITY	160 Billion Bytes
MAXIMUM COMMUNICATION LINES	512 plus Local and Wide Area Networks
PROGRAM ADDRESS CAPACITY	4 Billion Bytes
BUS SUPPORT	Availability includes 6 UNIBUS,™ 2 SBI, 4 DR 780, 3 CI and 4 MASSBUS™
PHYSICAL DIMENSIONS	60½" x 73½" x 30"
POWER CONSUMPTION	6.5 KW (10 KVA)
AIR CONDITIONING REQUIREMENTS	22,200 BTU/hr
ACOUSTIC LEVEL	60 dBA

The expanding VAX family.

VAXCLUSTERS LET YOU SHARE THE WEALTH OF VAX RESOURCES.

The large-scale storage and multi-user support you get with Digital's VAX 8600 system can be increased many times over with VAXcluster™ systems. This multiprocessing capability, which is unique in the industry, lets you combine the resources of several VAX processors and manage them as a single system. VAXcluster systems enhance data integrity and increase system availability, with complete user transparency.

VAXcluster systems can be configured with up to 16 processors and storage servers in a variety of combinations. You can boost computing power in an existing VAXcluster configuration by adding a VAX 8600 system. Or you can build a new VAXcluster using a VAX 8600 system as a compute server.

The wealth of resources available to all VAX systems includes VAX Information Architecture, which offers a CODASYL-compliant database – VAX DBMS; and a relational database – Rdb/VMS. This software, together with the RMS hierarchical file manager which is part of the VMS operating system, can all use the DATATRIEVE™ user-friendly query language. And they all benefit from a Common Data Dictionary that eliminates data redundancy and permits record-, field- and user-specific security controls. What's more, you can automate your office with Digital's ALL-IN-1™ software.

All VAX systems give you a complete set of program debuggers, editors, and screen management utilities to work with. You have a choice of 15 programming languages. And you can combine different languages in a single application through the common calling standard.

ENGINEERED FOR COMPATIBILITY AND RELIABILITY.

Digital's VAX 8600 system is compatible with every other VAX processor. It can also work with many other systems you may already own. Digital's DECnet™ networking software links Digital systems, users, files and applications over a variety of communication devices, such as Ethernet, leased lines, standard telephone lines, and public wide area networks. We offer protocols for communication with non-Digital environments, such as the SNA™ gateway.

The VAX 8600 system is engineered for the reliability your large-scale applications require. Self-diagnostic intelligence simplifies maintenance.

BEST ENGINEERED MEANS ENGINEERED TO A PLAN.

The VAX 8600 system, like all Digital hardware and software products, is engineered to conform to an overall computing strategy. This means our systems are engineered to work together easily and expand economically. Only Digital provides you with a single, integrated computing strategy direct from desktop to data center.

For a brochure on the VAX 8600 system, contact your local Digital sales office. Or call 1-800-DIGITAL, ext. 280.

THE BEST ENGINEERED COMPUTERS IN THE WORLD.

Rolm acquisition girds IBM for telecom, PBX mart push

CW AT ENTERPRISE INFO SYSTEMS

By Kathleen Burton
CW West Coast Bureau

SAN DIEGO — IBM's acquisition of Rolm Corp. will yield several new private branch exchange (PBX) voice and data products and represents the importance the company places on providing telecommunications products and services, an IBM marketing executive said recently.

At the Enterprise Information Systems Forum here, Kenneth B. Simon, IBM manager of product marketing, stressed the importance of IBM's recent acquisition of Rolm — the Santa Clara, Calif.-based telecommunications firm — and its 60% ownership of Satellite Business Systems, a satellite communications firm.

IBM plans to emphasize its thrust into the telecommunications arena in several ways, said Simon, by sponsoring business shows to announce and display new telecommunications products (IBM sponsored six such shows in 1984), by emphasizing issues and product-oriented advertising and by developing specialized telecommunications product marketing groups.

Expand telecom experts

IBM will also expand its cadre of telecommunications specialists from current bases in nine U.S. cities, and they will work closely with IBM account teams, he said. To support its customers directly, IBM also will develop executive briefings, hold seminars and offer network modeling to measure and predict a customer's future networking needs with a 99% accuracy rate, Simon said.

IBM's Fortune 1,000 accounts, according to Simon, are now demanding telecommunications products in several areas where IBM is not yet strong. Customer requests include voice terminals, digital workstations, remote high-speed digital links, digital multiplexers and networking capability to non-IBM hosts, he said.

Future products will focus on extending network connectivity, providing network management capability, expanding services and optimizing existing network configurations with enhancements to IBM's 3710 network controller and 7426 terminal interface, both introduced last year.

"Within the next year and a half, IBM will develop products that will connect a customer's manufacturing plant directly to his office," Simon said. The products will be extensions of IBM's token-bus protocols and broadband local-area network products, Simon said.

Customers will be able to customize the design by specifying whether they want independent local-area nets, networked IBM Personal Computers or structured intraoffice wiring. "IBM will also make an increasing thrust into the message marketplace," Simon said. IBM recently introduced its first messaging products: an audio distribution system, a telephone message management system and a voice/text messaging system, Simon said.

Paladin out to restore credibility to Visicorp name

By Kathleen Sullivan
CW West Coast Bureau

LAS VEGAS — Paladin Software Corp. was a fledgling start-up in search of a second round of venture capital financing when it decided to merge with troubled, but cash rich, Visicorp.

The proposed merger of the two firms will solve Paladin's need for funds to continue working on its own product line, said Roy Folk, founder and president of Santa Clara, Calif.- based Paladin.

On the other hand, he acknowledged, the firm now shoulders a formidable task: restoring credibility to the Visicorp name and reclaiming confidence in its product line.

In an interview at the recent Comdex/Fall '84 held here, Folk, who worked at Visicorp for 2½ years before starting at Paladin, said he was confident the new firm "will be able to resurrect the good memories" that Visicorp was once able to evoke.

The new company, which will be known as Paladin Software Corp., will be headquartered in San Jose, Calif.

Visicorp, which gained early prominence in the personal computer industry as the distributor of Visicalc, has been beset with problems during the past year and a half.

When it was unable to provide enhancements to Visicalc, the firm lost market share and revenues to new competitors such as Lotus Development Corp. After an extended legal battle with Visicalc's creators, Software Arts, Inc., Visicorp lost the right to market its flagship product.

Problems with Visi On

In addition, Visicorp faced product delays and technical problems when it tried to design its next generation of software, an operating environment known as Visi On, Folk said.

But Folk said Paladin is prepared to restore the health and viability of Visicorp's product line, which includes Visi Series programs such as Visi Word and Visi Schedule, Flash Calc, PC Paint and Visi On.

As evidence of Paladin's commitment, Folk pointed to several product introductions made recently at Comdex. Included among them was a new version of Visi On, designed for the IBM Personal Computer AT. The new version, which takes advantage of the AT's 286 microprocessor, runs 3½ times faster than the original Visi On, Folk said.

More applications

When the original Visi On was unveiled, only one applications program was available, Folk noted. But now, all the applications programs for Visi On are ready, including spreadsheet, word processing, business graphics and presentation graphics programs, Folk said.

Paladin has also answered critics that said Visi On was overpriced. At $495, Visi On is aggressively priced to go up against industry leaders such as Lotus' 1-2-3 and Symphony and Ashton-Tate's Framework, Folk claimed.

"If we have the quality product that I believe we have, we now face the grueling task of turning dealers around," he said.

Folk declined to describe the products that Paladin has been working on. "We want to maintain a low profile until we are prepared to announce and ship the product," he said.

He said the products, which are being developed for the business market, will be introduced next year.

Long talks led to Visual Technology buy-out

By Kathleen Sullivan
CW West Coast Bureau

LAS VEGAS — The proposed acquisition by Lee Data Corp., the Flying Cloud, Minn.-based vendor of IBM-compatible terminals and workstations, of Visual Technology, Inc., a Tewksbury, Mass., firm [CW, Nov. 19], had been under discussion for about two years, according to the presidents of both companies.

In a deal worth about $17 million, Visual Technology would become a wholly owned subsidiary of Lee Data, according to a preliminary merger agreement. Visual Technology would retain its current management, and its president, Tom Foley, would join Lee Data's board of directors.

Visual Technology, which sells Digital Equipment Corp.-compatible terminals, a Televideo Systems, Inc. emulator terminal and a 16-lb IBM-compatible portable, last week introduced the Visual 2000, a Microsoft Corp. Xenix-based multiuser system.

In an interview at the recent Comdex/Fall '84 here, John M. Lee, president of Lee Data, and Visual Technology's Foley said the proposed merger would serve to round out each other's product lines and strengthen each company's competitive position.

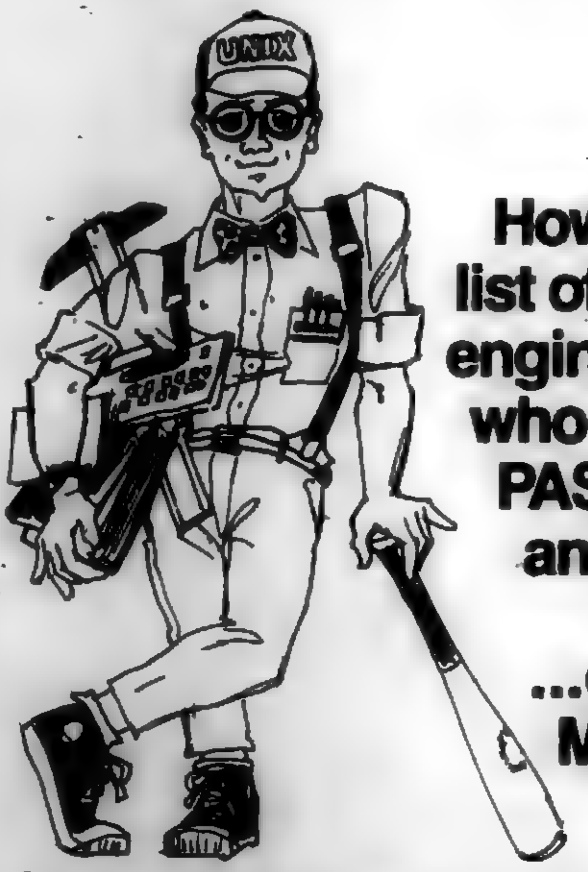
"Every one of our customers has IBM and non-IBM systems," Lee said. "With the merger, we will be able to sell IBM as well as non-IBM systems."

Foley said he expected "substantial incremental sales" when Lee Data's national sales force begins selling his firm's products. He said the two firms are currently discussing the sale of Lee Data's products through Visual Technology's third-party distribution network.

Foley said the proposed merger will fortify Visual Technology's financial base. The planned merger will also serve to strengthen each firm's market position, he said.

Lee said Visual Technology's portable, known as the Commuter, would serve as a "nice entry-level product," in the Lee Data product line. He added that the company planned to integrate Visual's new 2000 system into Lee Data's next generation of 3270 products.

The planned merger calls for the exchange of a half share of Lee Data stock for each share of Visual Technology's 4.9 million shares of outstanding common stock. At Lee Data's closing price on Nov. 9 of $6.85 a share, the transaction is reportedly valued at approximately $16.8 million. The merger is subject to the approval of each company's board of directors as well as each firm's shareholders.



How would you like a list of all the left-handed engineers in the country who play baseball, talk PASCAL, know UNIX* and like Magritte...

...on your desk by Monday morning?

You know going to search can often be going nowhere fast. It's usually months before you get any action. Seasons come and go, leaves fall, flowers bloom and you're still sitting in front of the same stack of requisitions.

CORS offers you a different and more effective approach and, as if that weren't enough, we'd like to add that we do it for much less than standard search fees.

Isn't it about time you had a new method, a better system, a more effective way to go about your business? The recruiting office seems to have been left behind as changes swept into every other area of Human Resource Management. New theories, practices and techniques abound in compensation, benefits and employee relations—yet recruiting has been left to sing another chorus of Yesterday.

And isn't it about time that someone looked at how search firms determine fees. Think about it. The left-handed, art-loving engineer mentioned above is about as hard to find as a new Chairman of the Board. But headhunters play the percentages. The higher the salary of the incumbent the higher the fee you end up paying. Isn't it a basic law of economics that what you pay should in some way be related to what it costs to deliver the product or service? Of course, the result of this imbalance is that all the search energy goes into the top paying jobs and you can get left with a lot of holes in your middle management.

CORS does it differently. We charge $55 an hour.

And for that you get the kind of research it takes months for a search firm to deliver bound and on your desk in 1 week.

How does it work? You talk to our Industry Analyst, a qualified executive who knows your industry cold. From this discussion, a detailed brief of your position is developed. This information is passed on to our researchers who compile candidates who meet your specifications. The latest in state of the art systems and database technologies is running full time in our backrooms. The focus of our service is a research capability that no search firm could afford to deliver.

We screen candidates on the phone and proceed to identify candidates we think you should talk to. Additional data results from these in-depth interviews and we pass that along with our candidate recommendations. You'll get information on your company's image in the marketplace, evaluations of your competitors and some reaction to the job, salary, etc. that you're looking to fill. We can even handle reference checks and psychological testing if you wish.

CORS figures the above service usually takes 40 hours. However, we offer a package—The CORS Report—which includes your screened candidate list and all the above additional information for a set fee of $2290 (phone and travel expenses are additional). It's easier for both of us than counting the hours.

So if you're looking for a right-handed marketing director who reads Fitzgerald and knows semiconductors—and you, as usual, needed him/her yesterday—think of CORS.

We know the best solutions are usually the fast ones.

If you'd like to receive more information, or would just like to talk about how CORS may be able to help meet your current needs, please call Tom DeBourcy, Director of Marketing, 1-800-323-1352. (Within Illinois, (312) 773-8555.)

Profits up at Cullinet

WESTWOOD, Mass. — Cullinet Software, Inc. last week reported second-quarter profits of $5.9 million, or 39 cents per share, up 57% from year-earlier profits of $3.8 million, or 25 cents per share.

For the quarter ended Oct. 31, the company reported revenues of $43.5 million, a 58% increase over the second quarter a year ago when revenues were $27.7 million.

Robert N. Goldman, president and chief operating officer of the company, noted the report represented the 27th consecutive period of increases in both revenues and profits.

Cullinet continues to experience rapid growth in sales of mainframe data base management and applications products and also began shipping its Goldengate microcomputer integrated software package during the quarter, Goldman said.

MAI set to sell Basic Four unit

NEW YORK — Management Assistance, Inc. (MAI) said recently that it has signed an agreement for the sale of its Basic Four Information Systems unit to a company formed by Bennett S. LeBow, a private investor.

The company said the final sale is still contingent upon approval of the purchaser's financing arrangements. "The financing arrangements have progressed sufficiently for us to sign the definitive agreement," the company said in a statement.

LeBow reportedly will pay $30 million in cash and $75 million of debt and preferred stock for the Basic Four unit.

MAI is also in the process of selling its other major segment, the Sorbus Service division, to Bell Atlantic Corp. for $175 million. That sale must be approved by a federal court.

MAI said it has filed a preliminary proxy statement with the Securities and Exchange Commission for the complete liquidation of assets and dissolution of the company following the sale of its two divisions.

HP reports $665 million tax-benefited profit

PALO ALTO, Calif. — Aided by a $118 million tax-change windfall, Hewlett-Packard Co. last week reported fiscal year 1984 profits of $665 million or $2.59 per share, compared with year-earlier profits of $432 million or $1.69 per share.

HP reported an extraordinary tax benefit of $118 million resulting from federal tax law changes earlier this year, which forgave accrued tax liabilities owed by domestic international sales corporations. Discounting the tax benefit, HP said its profits for the year would have increased by 27% to about $654 million or $2.55 per share.

Revenues for the year were $6 billion, a 28% increase over year-earlier revenues of $4.7 billion. For the fourth quarter, the company reported profits of $167 million, or 65 cents per share, up 14% compared with year-earlier profits of $147 million, or 57 cents per share. Revenues for the quarter were $1.6 billion, up 27% from the fourth quarter of 1983 when revenues were $1.3 billion.

The fourth-quarter profits were not particularly strong and HP President and Chief Executive Officer John A. Young said that reflected a competitive environment and discounts and aggressive foreign pricing to help offset the effects of the strong U.S. dollar overseas.

Young also said that while orders in the quarter remained strong, there was a softening of orders in the U.S., which climbed only 13% over year-earlier figures, while international orders rose 39% in the same period.

Datapoint profits plunge

SAN ANTONIO — Datapoint Corp. reported a more than threefold decline in profits for the first quarter, with revenues just barely ahead of year-earlier results.

Profits for the period ended Oct. 27 were $1.5 million, or 7 cents a share, compared with $5.4 million, or 27 cents a share, in the same period a year earlier.

First-quarter revenues were $140.1 million, compared with $139.7 million a year ago.

"Although revenue in the quarter was virtually the same as a year ago, sales revenue in our domestic markets was down substantially. from the first quarter last year, reflecting the depressed order rate and lower backlog experienced in the fourth quarter," said Harold E. O'Kelley, board chairman and chief executive officer, in remarks at the company's Nov. 15 annual meeting here.

O'Kelley attributed the lower profits to "slightly lower" gross profit margins, increased engineering and product development costs related to new product introductions and increased marketing costs for international subsidiaries.

O'Kelley said that the continued strengthening of the U.S. dollar overseas had an adverse effect on the company's international business. He said the company plans to expand its product line and to extend its position in local-area network products.

ACRS from page 97

try, which has honed the entrepreneurial spirit to a fine edge by using ACRS and other tax loopholes to finance leases through outside investors who reap the benefits of ACRS and investment tax credits.

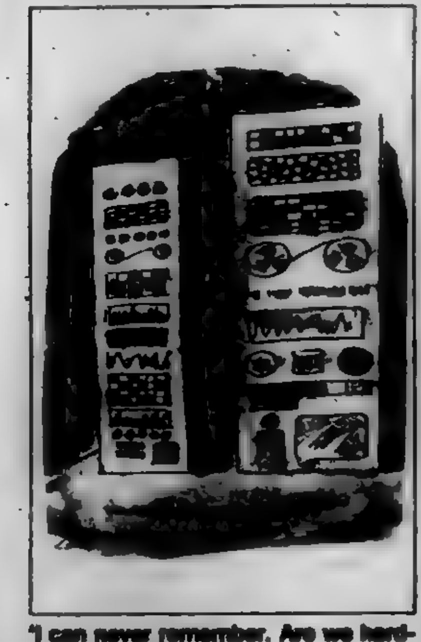
While ACRS is sometimes criticized for favoring older, smokestack industries over high-tech industries, various elements in the computer industry have been arguing that depreciation should be accelerated for computer equipment.

R&D tax credits unlikely

In the current climate, that seems unlikely; what seems even more unlikely is expansion of R&D tax credits.

When the Reagan administration came to Washington, D.C. in early 1981, it was the fragmented coalition of liberals and social groups that howled with fright.

If current signals are correct, businessmen and supply-side conservatives will howl the loudest in early 1985.



"I can never remember. Are we hardware or software?"

Eagle revenues fall sharply

GARDEN GROVE, Calif. — Eagle Computer, Inc. reported a $2.3 million loss, or 16 cents per share, on sharply lower revenues for the first quarter ended Sept. 29.

In the year-earlier period, Eagle, a maker of IBM-compatible microcomputers, had a profit of $81,000, or one cent per share. Revenues for the latest quarter were $4 million, compared with revenues of $14.2 million a year ago.

Ronald N. Mickwee, Eagle chairman, said the first-quarter results were "as we predicted." He noted that the results showed improvement over the prior two dismal quarters, attributing that to cost-cutting measures taken during the past several months.

The company recently laid off 55 employees, closed its headquarters in Los Gatos, Calif., and moved its operations to its manufacturing plant here.

In the fourth quarter ended June 30, the company reported a staggering loss of $17 million, nearly four times the $4.9 million in revenues it took in during that period.

Although the company's latest revenue figures were still lower than the earlier quarter, Mickwee, referring to the reduction in losses, said, "Our plan continues to work; we've apparently turned the corner."

On a brighter note, the company announced it had received government approval for more than $4 million in desktop microcomputer orders [redacted]

Eagle said it anticipates approval of additional orders in the near future.

IBM

from page 97

cations backlogs of two years in DP departments were slowing growth. Another survey of Fortune 500 companies in 1978 showed the backlog to be four years. IBM was losing revenue because of the bottlenecks, and minicomputer vendors were providing frustrated users with solutions.

The bottlenecks were partly IBM's fault, he added, because the 1978 survey showed that programmers were spending 80% of their time maintaining applications and only 20% of their time developing new applications. "By too frequent operating system releases, IBM was shooting itself in the foot and creating a maintenance problem on its user sites," Lamond said. With on-line programming replacing off-line batch programming and users having access to a data base to run their own applications, the productivity figures have been reversed, Lamond said.

Minicomputer vendors

While DP departments were struggling with two- to four-year bottlenecks, the minicomputer vendors were able to deliver dedicated minicomputers to end users within six months.

This was due in part to DP departments programming on mainframes in Cobol while minicomputer vendors provided customized standard application packages. To help meet the competition, IBM announced programmable small-business minicomputers such as System/36, in addition to the productivity aids, according to Lamond.

"That is the IBM strategy to help you all be more productive, so that you more quickly need more IBM processing power," Lamond said. The productivity aids are in the best interest of users "if your DP programmers cannot keep up with end-user requests for new applications" and if the application backlog is growing, he said.

Alternatives do exist to implementing the productivity aids on a central mainframe, including desktop personal computers or time-sharing with the mainframe, and to implementing on-line, real-time transaction processing, Lamond advised.

U.S. chip billings declining

SAN JOSE, Calif. — Semiconductor bookings and billings in the U.S. continued their downward trend in October, according to Semiconductor Industry Association statistics.

The association's yardstick of its member companies' health, the book-to-bill ratio, measuring new orders against completed orders, fell to 0.67:1 in October.

A figure of 1.1:1 or 1.2:1 is generally considered good.

The figure includes bookings and billings for semiconductor manufacturers based in the U.S., Europe and Japan.

In October, the association said, semiconductor users continued to reduce inventories accumulated during late 1983 and early 1984, a period of exceptionally high orders.

"While the short-term situation is of great concern to the industry, we believe that the underlying fundamentals of the economy will support continued long-term growth," said association President Thomas D. Hinkelman.

Hinkelman said that the U.S. Department of Commerce has estimated that the electronics industry — the largest consumer of semiconductors — will experience an 18% growth this year and 15% growth in 1985. He said the association believes that purchasing agents for those manufacturers overbought during the first nine months of 1984.

STC

from page 97

Ross & Co. in New York, the accounting firm that reportedly helped put the agreement together, said the firm had no comment.

Richard Hastings, an analyst with Merrill Lynch & Co. in New York, said he was not surprised that the loan fell through. "When they first announced [the loan], I thought it definitely wasn't a done deal," he said, adding, "The company is operating under Chapter 11, with numerous creditors having a stake in what's going on. It was a tentative thing from the start."

Even if the $150 million loan had gone through, Hastings said, it would only have bought some time for STC. "I think the problems there are very deep," he added. "I don't expect the company to come out [of Chapter 11] as an independent entity in any shape or form."

Under the agreement with Chemical Bank, the bank would have been given "superpriority" over the company's other unsecured creditors, the largest of which is New York-based Citibank, which is owed $38 million. STC would have paid interest on the funds at 1.5% above the prime interest rate.

Analysts have said STC is likely to be liquidated or acquired if it does not receive significant funds to operate soon.

Pressured by its creditors and in default on most of its bank loans, STC filed for Chapter 11 on Oct. 31. As of Sept. 28, the company owed about $450 million in long- and short-term debt, about $15.7 million of which was secured, according to company financial data.

MSA

from page 97

dum," which was sent to 50 interested individuals, Smart said. The memorandum broke the firm down into four separate groups — business software, international sales, educational software and microcomputer distribution — that could be bought separately.

Why did MSA decide to sell Peachtree, which is known for its accounting software designed for the IBM Personal Computer? When MSA purchased Peachtree 3½ years ago, the mainframe software firm hoped to find some "synergism or economies of scale" through the acquisition, Smart said.

But instead, MSA and Peachtree discovered very little overlap between selling mainframe software to executives and selling microcomputer software through retail channels, Smart said.

And Peachtree stopped "acting like a microcomputer software company." The operations of the subsidiary moved into MSA's building in Atlanta and, in the process, were transformed from a low- to a high-overhead firm, Smart said. "Our overhead must have quadrupled since we became an MSA company," he said.

The metamorphosis of Peachtree will include a new emphasis on retail sales. In the past, Smart said, more than 50% of Peachtree's revenues came from sales to hardware companies. While selling software to manufacturers maximized revenues in the short term, it proved to be a poor strategy in the long term: When the personal computer industry stumbled, Peachtree suffered.

But Smart was optimistic about the firm's future. Peachtree has already started to act on plans to revamp the company's strategies, he said. He predicted the company's revenues would reach between $15 and $20 million in 1985 and said the firm, which was not profitable this year, will be profitable next year.

It will not be an easy task though, because in addition to its traditional competitors, Peachtree has a new foe. In September IBM joined the field, announcing its Business Management series of accounting software.

Once a buyer is found, the actual sale could take up to nine months to finalize, Smart said. In the meantime, MSA has not curbed Peachtree's spending or development work, he said.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in 25 countries is the largest in existance. Over 9,000,000 computer-involved people read our publications every month.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. Because we place your advertising through our U.S. office, you won't have to pay the VAT (value added tax, ranging from 8-20% of your ad-space purchases) which is regularly charged on all advertising placed abroad. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now The sooner we hear from you, the sooner you'll hear from our readers.

SYSTEMS ANALYSTS

PROGRAMMER/ANALYSTS

Be part of an exciting new NCR project.

NCR, a leader in hospital information systems since the early '70s, is now embarking on the most comprehensive and cost effective Hospital Information System ever designed. This effort offers exciting career prospects to professionals with or without a hospital background.

Hospital Industry Analysts—Will define current and future hospital industry information processing requirements, including hardware and software functionality, data relationships, and design standards. Requirements include industry expertise in the areas of Pharmacy, Clinical Laboratory, Radiology, and Nursing Administration. Must be capable of working both independently and in a team and will present design concepts to a diverse group of users and developers.

Lead Analysts—Will create Functional–SPECS and Implementation–SPECS from requirements documents. Ideally all applicants must be innovative professionals with strong working knowledge of COBOL, Transaction Processing and Data Base essential. Knowledge of TOTAL and DMS useful.

Microcomputer Specialist—Will design, program and implement applications of the new interactive intelligent work stations using BASIC, PASCAL and C in a UNIX* environment. Micro to mainframe expertise is a plus.

All positions require a BS degree in Computer Science or related area. Appropriate experience may be considered in lieu of degree. These openings are based at NCR's headquarters in Dayton, Ohio—one of the Midwest's most attractive and affordable areas.

Salary commensurate to qualifications. Excellent benefits and outstanding career prospects are offered. For prompt, confidential consideration send resume and salary history to: **Mr. Robert Brown, NCR Corporation, Dept. K88, USG-1, Dayton, Ohio 45479.**

Member of the BASF Group

an equal opportunity employer-m/f/h

By looking toward the future, one of the greatest scientists of our time, Albert Einstein, challenged the thinking of his day with his theories of relativity which revolutionized the concepts of space and time.

You can take part in a successful tradition of creating the future. With Compugraphic.

"Imagination is more important than knowledge"
Albert Einstein

We've got the Systems for Success

Yours and ours.

Systems that are changing the way the world looks at graphic communications. Systems as flexible as your needs . . . and needs of our customers.

At Compugraphic, we've worked hard to redefine technology, from the ground up. To change the course of graphic communications in new and exciting directions and applications. And we did it with the help of talented and creative Software Engineering professionals like you, who have an eye on the future.

The results of this forward thinking are reflected in record sales of $350 million in the past 12 months (with a record $100 million in the third quarter alone), and in graphic systems as diverse as the requirements and needs of an industry itself. Systems that are bringing success not only to our customers, but to us and the talented professionals who helped us create them.

If you're creative, experienced and ready to explore, innovate and take chances . . . we've got the system for your success. And it's waiting for you, now, at Compugraphic.

MODULAR COMPOSITION SYSTEMS

A product development group dedicated to developing the next generation of graphics interactive text processing products.

Software Section Manager

Excellent opportunity to lead a team of up to 16 software professionals in the design and development of a highly interactive "what you see is what you get" bit-map graphics workstation

- Intel 80186 microprocessor
- 1 + mb memory
- "C", UNIX™

Sr. Software Engineers

Exceptional opportunity to be senior contributor in new group responsible for:

- Operating systems and software security
- Memory management
- Intelligent peripherals and co-processor interfaces
- Development environment for 286/386 Intel microprocessors

GRAPHIC ARTS

Sr. Software Engineers

Several positions available at all but entry level. You should possess the following skills and capabilities:

- Micro-base software development
- Graphics/text software background
- Familiarity with Assembly, "C" or Pascal
- Real-time systems
- Device drivers, systems supervisors and file systems

ENGINEERING TECHNOLOGY

In-house design teams responsible for investigating and developing new technologies for product design groups.

Sr. Diagnostic Engineers

Utilize your problem solving skills by developing software to find hardware faults in microprocessor based systems.

- Experience in assembly or firmware
- An understanding of hardware. You must be able to influence design for testability
- BSEE or BSCS and at least 3 years' experience

NEW PRODUCT DEVELOPMENT

Senior/Principal Software Engineers

There are several lead technical positions in new product areas which are just beginning and which represent outstanding challenges and growth opportunities:

- Composition and pagination
- Display ad and terminal applications
- Software Q.A
- UNIX™ internals
- Raster graphics
- Hierarchical database
- System/file servers

We employ 3000 people and offer excellent salaries, benefits and a relocation package. Compugraphic is located off Route 128—America's High Technology Highway. We're just 20 minutes from all the educational and cultural resources of Boston, and close enough to enjoy the many recreational opportunities of New England's beautiful mountains and beaches.

Please Send Resumes to Dawn C. Wilson.

Creating the Future of Graphic Communications

An Equal Opportunity Employer

CONSULTANT PROGRAMMER/ANALYST - to write new financial system including coding, testing and debugging of programs, utilizing System 2000 Data Base, OS/JCL, and working on medium system IBM mainframe. Salary $12.00 per hr., basic 40 hour week. Requirements 6 years college, Master's Degree in Computer Science. Send resume to MESC, 7310 Woodward Ave., Room 415, Detroit, MI 48202, reference No. 44584. Employer paid ad.

Data Processing Manager

We are an international CPA firm. Our client, a successful wholesaler and retailer located in Southern California is seeking a Manager of Information Systems.

The successful candidate will have a B.S. or B.A. Degree, PICK operating system experience and six to eight years D.P. experience including two years in management. The candidate must have good project management, administrative, communication and personnel skills and be capable of working with creative rather than pre-programmed approaches. The candidate will also have a business orientation as well as strong technical skills.

The organization offers excellent benefits and the salary ranges from $35,000 to $40,000 per year commensurate with experience.

If you are interested in growing both technically and professionally with our client, please send your resume with salary history in strictest confidence to:

Box CW-84086, Computerworld, Box 880, Framingham, MA 01701

DATA PROCESSING PROFESSIONALS

When Aramco Services Company hires you for work in Houston, you'll earn a fine competitive salary and participate in a very attractive benefits program.

You'll also gain professional experience that you probably could not duplicate anywhere. Your work will be in support of Aramco, the largest oil-producing company in the world.

Join us in one of the following high visibility roles:

DASD MANAGEMENT ANALYST

Requires a BS, preferably in Computer Science, and 7+ years in computer systems analysis, including DASD management/analysis, HSM and ASM2. Ability to analyze/evaluate strategic DASD utilization, and justify/present recommendations for standards, policies and procedures is essential.

OFFICE AUTOMATION ANALYST

Requires a BS in Computer Science or Engineering, and 6+ years systems analysis experience in the field of office automation, using minicomputers and microprocessors. Also required is the ability to perform system engineering, problem analysis, office automation evaluation; make recommendations; and handle project management. Wang and IBM OA experience preferred.

CAPACITY PLANNER

Requires Bachelor's degree, preferably in Computer Science or Math, a minimum of 7 years experience with IBM 3081, MVS/XA; and at least 1 year in capacity planning activities including workload forecasting, impact analysis, hardware planning/usage and service reporting. Experience with MICS, BEST 1, and SAS is desirable.

SYSTEMS PROGRAMMER

Requires a BS in Computer Science and 3-7 years in an IBM-MVS environment with knowledge of IBM 370 Assembler. Problem determination and resolution skills are required in any of the following areas: IMS DB/DC, CICS, IBM Program Products, TMS, SAS and PGF-CDDM. Past experience supporting MICS is a definite advantage for qualified candidates.

DATABASE ANALYST

Requires a BS in Computer Science and 5 or more years experience with physical and logical data base design, IMS/DB-DC, IMS utilities and performance monitoring and tuning in an IBM-MVS/XA, JES2 environment.

We offer fine competitive salaries and extensive benefits including medical/dental coverage, savings plan with company participation, continuing education programs, a company cafeteria, van pools, and paid parking.

MANAGERS IN HIGH-TECH EDUCATION

Applicon's Education Department is aggressively expanding its operation by adding staff and facility resources nationwide. During this exciting growth phase, we need capable, enthusiastic, and experienced individuals to fill our key openings. Besides the existing openings for CAD/CAM Instructors and Course Developers, the following challenging management positions are available:

Customer Applications Engineering Education Manager

In this position, you will manage other managers who are responsible for designing, developing, and implementing Customer and Application Engineer training programs/products nationwide. By leading and directing a group of highly motivated, capable professionals, you will refine and expand the existing curriculum.

To qualify, you should have at least three years of high-tech education management experience and over 5 years of experience in the high-tech industry. Experience in the CAD/CAM industry is a plus. A Bachelor's Degree or commensurate experience is required.

Sales Education Manager

As a key member of our Education Department and Sales Organization, you will design, develop, and deliver Sales Education programs, providing product and sales skills training to Applicon's worldwide sales organization.

You should have 2 years of high-tech sales training experience and/or 3 years of successful high-tech sales experience. Management experience a plus.

Send resumes to Deborah Rorke, Dept. CW1119, Applicon, A Schlumberger Company, 32 Second Avenue, Burlington, MA 01803. We are interested in your talent, not your age, sex or race.

DIRECTOR, INFORMATION SYSTEMS AND ADMINISTRATIVE COMPUTING
The University of Maryland University College
European Division   Heidelberg, F.R. Germany

University College, the worldwide continuing education campus of The University of Maryland, conducts undergraduate and graduate programs in Europe, Asia, and Maryland/Washington, DC. The European Division, established in 1949, serves approximately 40,000 students a year in U.S. military communities in thirteen countries. The administrative headquarters of the European Division are at Heidelberg, F.R. Germany with a staff of 135. Administrative computing at the Heidelberg office is provided by a HP 3000 series 68 mini and HP 150 micros.

Responsibilities: The Director oversees all administrative computing operations of the European Division and is responsible for strategic planning to ensure that the European Division continues to provide advanced, high quality administrative computing and office automation; leads the development and implementation of a data network involving distributed computing, micro and minicomputer workstations; develops applications and coordinates with users of administrative applications including financial, payroll, student records, management information systems; coordinates the overall operation of the administrative computing services, and other duties as assigned by the Director, European Division. Supervises a staff of ten.

Qualifications: Master's degree; extensive background in computer operating systems and hardware including microcomputing; a thorough understanding of data communications networking; excellent interpersonal communication skills; a record of managerial accomplishment in a full-service computing environment; familiarity with HP hardware. Specific knowledge of 3000 series 68 mini and HP micros is preferred.

Salary: Commensurate with qualifications

Expected Starting Date: February 1, 1985

Application Deadline and Procedure: The deadline is December 17, 1984. Submit a letter of application, professional resume, and the names of three references. Applications received after the deadline will be considered at the discretion of the Search Committee.

Search Committee, DISAC, c/o Chancellor's Office, The University of Maryland University College, University Boulevard at Adelphi Road, College Park, MD 20742
The University of Maryland is an Equal Opportunity, Affirmative Action Employer.

ANALYST/PROGRAMMER

An exciting opportunity to become a member of the systems development team at Case Western Reserve University. Our role is to provide modern management systems to all parts of the University. We need competent analyst/programmers dedicated to quality and user satisfaction to deliver on-line, data base systems. If you agree with our direction and have 2-3 years experience on large system DEC equipment, do write stating your qualifications.

CASE WESTERN RESERVE UNIVERSITY
Human Resources
10900 Euclid Ave.
Cleveland, OH 44106

We are An Equal Opportunity/Affirmative Action Employer M/F/H

Never mind the sophisticated hardware and great salaries. It's what an overseas assignment can do for your career that really counts.

Allied Medical Group (AMG) are leading British health care consultants to the large and prestigious Riyadh Al-Kharj Hospital Programme in Saudi Arabia.

The multi-machine installation that serves the 660 bedded hospital has a network which serves the total patient and management information, laboratory, engineering, accounting and administrative needs of two of the Kingdom's most prestigious military hospitals.

Its hardware consists of an array of kit from top manufacturers including a Honeywell L66/10, 3 x HP 3000 (soon to include a Series 48) and a CDC CYBER 18/20. Existing software used includes: IDS1, TDS, GCOS3, GMAP, VPLUS, IMAGE, VIEW, COBOL, FORTRAN and SPL. "State-of-the-Art" software is soon to include fourth generation technology such as QUICK, QTP and QUIZ.

The Programme is at a very exciting stage and is in the process of preparing a long range computer strategy which will involve a major expansion of the network. We are looking to recruit two enthusiastic and dynamic computer professionals who will be able to play a major part in developing and supporting applications in close collaboration with the users.

Project Team Leader
(Hewlett Packard)

You'll be responsible for the supervision and control of the teams involved in the development, implementation and maintenance of the HP 3000 equipment. You will need in-depth knowledge of IMAGE, VPLUS, COBOL and preferably SPL, and experience with fourth generation tools such as QUICK, QTP and QUIZ would be a great advantage, as would experience of on-line hospital patient care systems.

For this post we seek someone with at least eight years experience including three in systems analysis/design, and two in project management and you'll need to show that you have developed and successfully implemented at least two major systems in the past.

This is a married status post.
Ref: P/RKH/3033/CW.

Programmer/Analyst

Working to the Project Team Leader, you will be involved in producing the source language coding necessary for the development of the new computerised information systems and the maintenance/modification of existing systems and programmes. You will also assist in system testing and implementation and participate in user and computer staff training.

You'll need to have at least an HND, or equivalent, and four years programming/analyst experience on the languages currently being utilized within the Computer Department.

This is a single status post.
Ref: P/RKH/3096/CW.

As well as a very generous salary and end of contract gratuity, the benefits package for these 2 year contract basis posts includes: free, fully furnished accommodation; four weeks leave for every six months service; free air fares (including leave flights) and extensive welfare and recreation facilities.

So, for further details about how to enhance your future career prospects, please write, enclosing a full c.v. and quoting appropriate reference number, to: Theresa Sutherland, Senior Personnel Officer, Allied Medical Group, 12/18 Grosvenor Gardens, London SW1W 0DZ ENGLAND.

AMG

Allied Medical Group

In Software Development the alternatives are many, but the choice is clear.

For a quarter century, one company has been clearly recognized as the leader in software development. Year after year, Applied Data Research continues to define and redefine "state-of-the-art" for the software products industry. Our leadership is evidenced by our success in the development and sale of the most widely accepted and highly advanced IBM mainframe and microcomputer products.

ADR is continuing to create many new and interesting positions for qualified individuals who are seeking greater challenges and increased rewards in their endeavor for career growth. Currently, we have positions available in Princeton, NJ and Dallas, TX for persons experienced in the following:

- **SYSTEMS SOFTWARE DEVELOPMENT**
  - –4th Generation Languages
  - –Data Base Management Systems
  - –Word Processing/Electronic Mail
  - –Performance Measurement/Capacity Planning
  - –PC/Mainframe Communications
  - –Operating System Extensions
- **TECHNICAL SUPPORT SERVICES**
  - –Data Base Administrators and Consultants
  - –MVS/DOS/VM Technical Support
  - –Systems Programmers (MVS/VTAM/NCP)
  - –Systems Analysts/Programmers (DB/DC)
  - –Human Factors

ADR offers a comprehensive benefits package, liberal relocation assistance and compensation fully commensurate with your experience. For consideration, please forward your resume or call Gary Johnson, (201) 874-9000, APPLIED DATA RESEARCH, INC., Route 206 & Orchard Road, CN-8, Princeton, NJ 08540.

MIS PROFESSIONALS

Managerial and Supervisory Opportunities for Expanding IBM Multiprocessor Data Center in Florida

The MIS Department of GOULD INC., Computer Systems Division is expanding its Data Center at Divisional Headquarters in Florida. We operate dual IBM 4341's in a VM/DOS/VSE environment, with a large VTAM/CICS network. The following key positions are immediately available.

DATA CENTER MANAGER

You'll be responsible for managing a three shift/seven day Computer Center Operation, including systems programming, data entry, data control and quality assurance. The successful candidate will be an innovative leader with excellent organizational skills and will have a demonstrated record of successful management experience in mid to large multi-shift IBM environment. Experience with telecommunication networks also required. College degree is preferred.

Project Leaders

MANUFACTURING SYSTEMS FINANCIAL SYSTEMS

We are also staffing two key supervisory positions in the above areas. Candidates for both positions should have proven supervisory experience, excellent user interface skills and a strong background in an IBM, DOS, COBOL and CICS environment.

Candidates for Manufacturing Systems should have significant manufacturing systems experience. APICS certification and/or knowledge of MRP II/closed loop philosophy is a plus.

Financial Systems candidates should have several years of experience with financial applications in a manufacturing environment.

GOULD INC., Computer Systems Division is the price/performance leader in the 32-bit super minicomputer marketplace. Our home, Plantation, Florida is one of the fastest growing, cleanest hi-tech cities in Florida. As a suburb of Ft. Lauderdale, you'll find the convenience and excitement of a major city with the relaxing lifestyle of suburban living. And, with no state income tax, the cost of living is in your favor.

For immediate consideration forward your resume including salary history to **GOULD INC.**, Computer Systems Division, John DePrima, Dept. CW1126, 6901 W. Sunrise Blvd., Ft. Lauderdale, FL 33313. An Equal Opportunity Employer, M/F/H/V.

NATIONAL SPERRY (UNIVAC) RECRUITERS

We're Hiring Data Processing Professionals

Central and South West is a two plus billion dollar electric utility holding company offering competitive salaries, excellent benefits and stable working conditions. Our Information Services Department, as host center, provides services in a multi-company environment.

Our primary system software is MVS/SPI with JES2. Additionally we use TSO/SPF, COBOL, ROSCOE, and Command Level CICS. Our data base is IDMS. We were recently chosen to be one of Cullinet's beta sites for their new development software! We use Cullinet's 4th generation languages—ADS/O, OLQ, CULPRIT, etc.

Each of our current openings needs people with proven analytical skills and user interface experience in addition to technical knowledge and abilities.

If we're the type of company you are seeking, and your experience is from a similar environment, please send your resume and salary requirements to the Employee Relations Department. Principals only.

Programmer/Analyst
(Business Applications)
Typical project assignments include construction project management, land management system, corporate shareholder system, etc.
Will provide technical expertise in system design, problem determination and system maintenance efforts. Should have JCL skills and online experience (CICS, VSAM) plus exposure to data base concepts.

Sr. Programmer/Analyst
(Engineering Applications)
Multi-project assignments offering multi-company exposure will include CAD/CAM, VM/CMS, transmission design, etc.
Will provide scientific/engineering expertise in system design and implementation efforts. Should have prior scientific/engineering application experience plus IDMS experience.

Programmer/Analyst
(Engineering Applications)
Initial assignment to the mining information management project will result in the development of a total, stand-alone system using state-of-the-art technology.
Will provide online and data base technical expertise in system design and problem determination efforts. Should have related technical skills developed from manufacturing related assignments. IDMS, ADS/O experience important.

Central and South West Corporation
P.O. Box 220164 • Dallas, Texas 75222

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $2 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

COMPUTER OPPORTUNITIES

Salt Lake City, Utah

Hercules Aerospace Company, a leader in the areas of solid fuel propulsion systems, development and production of graphite fiber and composite structures, presently has career opportunities for experienced computer professionals.

BUSINESS

Business Programmer/Analysts

Candidates should have a BS in a computer related field and a minimum of 2 years experience on large IBM mainframes with emphasis on COBOL, IMS and TSO. Excellent communication skills and the ability to interface with user departments are a must.

Systems Programmers

Requires basic knowledge of assembler language and 2 plus years in one or more of the following: MVS/XA, MVS/370, TSO, JES 2 and/or IMS. Currently operating MVS/XA on a 3084Q with expansion program to include additional IBM computers.

Systems Programming Supervisor

Requires BS in a computer related field and 5 plus years with large IBM systems (MVS/XA, MVS/370 and/or IMS/VS). Ideal candidate will have management/supervisory experience and a technical degree.

SCIENTIFIC

Electronic Engineers

BSEE or EET and 2 to 5 years of experience working with control systems to solve automation problems using 68000 or 8080 technology. Experience with assembler and "C" language for mini/micro computers is desirable.

Math Modeling Specialist

MS or Phd Physics, Math or Computer Science with knowledge in all three areas. Individual will analyze and develop large scale computer simulation systems. Must be skilled in differential equations, 3-D geometry and FORTRAN programming. Mathematical models will be used for filament winding of asymmetric3-D surfaces with multi-axis winding machines.

Programmer / Analysts

BS ME, CE, ChemE with capabilities in numerical methods and computer graphics technology. IBM mainframe and FORTRAN experience with graphic language skills desirable. Interactive techniques are used to support engineering design and analysis systems. Familiarity with Apollo work stations would be a plus.

Software Engineers

BS in a technical field with a minimum of 2 years experience in real time applications, data acquisition, laboratory automation or robotic control systems. Individuals should be experienced with DEC PDP-11 RT/RSX operating systems and 68000 technology or have FORTRAN experience on IBM or Honeywell (CP-6) mainframes.

Hercules offers excellent salary, complete benefits and the opportunity for career advancement. Salt Lake City provides abundant recreational and cultural attractions, reasonable housing costs and an exceptional quality of life. If you meet the above qualifications, send a complete resume including salary history to: Al Bakke, (Business) or, Jim Jaquin (Scientific).

DATA BASE ADMINISTRATOR
Salary: $47,500 to $52,000/year plus benefits

The State of Alaska has a current vacancy located in Juneau. This is a supervisory position with responsibility for the development, analysis, design control and management of the State of Alaska data base systems.

Minimum qualifications are: three years of data base management systems experience on a system equivalent in size and complexity to IBM, IMS, Total Systems 2000, RAMIS, IDMS, or ADABAS, including one year of experience equivalent in kind and level to Data Base Specialist with the State of Alaska. PLUS three additional years of computer programming and/or systems analysis experience.

Note: The State's DBMS is ADABAS and preference is given to applicants with ADABAS experience.

DATA BASE SPECIALIST
Salary: $43,500 to $47,500/year plus benefits

Open recruitment is underway in order to find additional qualified candidates in the event of future openings. Positions are located in Juneau and Anchorage, and perform the full range of data base requirements in support of user activities. These include DBMS design, definition, organization, security, efficiency, documentation, generation, long term requirements, and operational guidelines.

Minimum qualifications are: two years of data base management system experience at a level equivalent to Systems Analyst II, EDP Programmer IV, or Systems Programmer II with the State of Alaska on a system equivalent in size and complexity to IBM, IMS, Total Systems 2000, RAMIS, IDMS, or ADABAS.

One year of experience listed above must have been in the analysis and design of data base applications and/or data base administration. PLUS at least three additional years of computer programming and/or systems analysis experience.

Send official State application or resumes to: Recruitment Coordinator, Pouch C-0201, Juneau, AK 99811.

THE STATE OF ALASKA IS AN EQUAL OPPORTUNITY EMPLOYER. WOMEN AND MINORITIES ARE ENCOURAGED TO APPLY.

State of Alaska

NEW ORLEANS

Spicy! That's the flavor of New Orleans. New Orleans provides its residents an enviable lifestyle. Great restaurants, a warm climate, and world renowned celebrations, such as Mardi Gras and the New Orleans Jazz and Heritage Festival, have kept New Orleans the Queen city of the south.

But New Orleans is much more than a great place to live, it's a great place to further your Data Processing career. New Orleans is the home of MIDDLE SOUTH SERVICES, INC., the service arm of the Middle South Utility System.

MIDDLE SOUTH SERVICES is currently involved in several projects including large scale IMS DB/DC systems development. The current hardware environment consist of IBM 3084, 3081, MVS/XA, 4381 VM, and Tandem. We have the following excellent career opportunities:

PLANNING AND CONTROL ANALYST A current opening exists in our Planning and Control section for an Analyst to work on the implementation and training of a systems development methodology package. The ideal candidate will have a B.A. in Business and 2-3 years experience in a computerized environment monitoring compliance with systems development standards, with an emphasis on planning and control. Experience in development of methodology is a strong plus with experience on methodology software packages.

ANALYST/PROGRAMMER (SCIENTIFIC) Requires previous experience in scientific applications with a sound knowledge of PL-1 or Fortran, Computer applications development with exposure to a VM operating system would be helpful.

ENGINEERING SYSTEMS ANALYSTS As a member of the power systems planning team you will be directly involved in program development and ongoing support to the Power System Planning Group. Programs used by this group are for planning future transmission and generation. Requires BSEE degree and minimum 2 years experience in application and program development.

ANALYST/PROGRAMMERS Position involves the development of various Business applications using COBOL or PL/1. Knowledge of IMS DB/DC and ADF is considered a plus. Large IBM OS/MVS experience required.

IMS SYSTEMS ANALYST Position involves systems analysis in a large scale multi-user IMS DB/DC environment, logical Data Base Design, utilization of TRANSFORM applications generator, testing and debugging on-line IMS programs, and development of reusable field update logic in data management transactions.

SYSTEMS PROGRAMMER, PROGRAM PRODUCTS Positions involve the installation and maintenance of various program products. The position requires two (2) plus years of program products installation and maintenance experience, plus experience working with SMP-4 or SMP/E.

Middle South offers an exceptional Relocation Package including:
Relocation Allowance (One Month's Salary)
Paid Moving Expenses
Paid House Hunting Trip
Mortgage Interest Differential plus Interim Living

We offer an excellent benefits Program and Compensation Package. For more information contact Joe Hotard, Byron Heath or Gary Silbert:

UNIVERSITY OF KENTUCKY
Associate Director of University Computing For Administrative Systems

The University of Kentucky, a major state supported institution with a total enrollment of 45,000 students consisting of a Main Campus, Medical Center, and a 13 college Community College System, seeks to fill the position of Associate Director of University Computing For Administrative Systems.

The Associate Director of University Computing for Administrative Systems, reporting to the Director of University Computing, is broadly responsible for the development and oversight of university-wide administrative and management information system plans, policies, and priorities. Specific responsibilities include: administrative & management information system planning, policy, and priority development; administration and management of major university data bases; oversight and review of administrative and management information system hardware and software acquisitions, and various administrative and management information system consultative services to administrative units at all levels within the University.

Minimum requirements are a Masters degree in management information systems and data base administration and management, and a minimum of six years experience in progressively responsible planning, policy making, and administrative and management information system positions or the equivalent combination of education and experience. Experience in higher education, experience in dealing with the problems and opportunities inherent in the administration and management of a complex University, familiarity with data processing and office automation equipment and commercially available administrative software, and the capability of communicating effectively and providing leadership in a comprehensive, decentralized educational environment preferred. Qualified applicants may be considered for academic tenure.

Deadline for receipt of letter of application, including minimum acceptable salary, and resume is December 14, 1984, but may be extended if additional applicants are necessary. Send to: Lou Proctor, Campus Employment Office, East Maxwell Street, University of Kentucky, Lexington, Kentucky [illegible]-0014.

VM SYSTEMS PROGRAMMERS

35 Hour Week! Easy Work

If that's what you really want, these jobs aren't for you. But if you're looking for a tough job as part of a small team developing VM/SP system software products, if you want growth and recognition for your ideas and work—read on.

We need two people: (1) A top VM/SP Systems Programmer with good CP internals knowledge and outstanding coding and debugging skills, experience with other systems is desirable. And (2) A Junior Systems Programmer or Trainee with VM/SP experience. Both will be involved in more than one of the following, depending on interest and skills: product planning, development and documentation, system maintenance, utility development, customer and internal user support.

What you can do is more important than what you have done—we want ability and the willingness to work hard, rather than a great resume. If you think you'd fit, please write to:

VM Systems Group Incorporated

TOTAL INVOLVEMENT: DRC

For more than 29 years, talented technical professionals have given Dynamics Research Corporation unmatched visibility within the Department of Defense in a field that demands nothing short of total involvement—weapon systems analysis, evaluation and engineering.

Right now, our continuing success has created challenging opportunities in Data Communications, Software Engineering and Information Systems Analysis and Development.

INFORMATION SYSTEMS

The challenge is information analysis and development to support DoD Systems Engineering and logistics support efforts. We are looking for degreed professionals with 2-20 years' experience in any of the following areas:

- **Honeywell DPS-6, GCOS, GMAP, DMIV/TP, IDS II**
- **VAX 11/780, VMS, DBMS, ORACLE, DATATRIEVE**
- **Data Communications—DoD Protocols, Public Data Networks, LANS.**

Our current openings include Programmer/Analysts, Systems Software Specialists and Systems Analysts. Some Systems Analyst positions are involved at the functional requirements level and require a strong background in user interface/requirements definition rather than specific vendor association.

SOFTWARE ENGINEERING & MANAGEMENT

Professionals in this group work with a wide range of state-of-the-art tools, with a strong focus on undersea and missile systems, avionics and C^3.

Tool involvement includes:

- **PSL/PSA**
- **SREM**
- **PASCAL**
- **CMS-2**
- **ADA**
- **DATATRIEVE & PDL**

If you're a degreed **Software Engineer** with 2-10 years' defense related experience, you can get involved with challenges ranging from project management, quality assurance and requirements analysis/specification to independent verification and validation, software metrics, nuclear safety analysis and tool development.

Get involved.

If you're a talented professional who demands nothing less than total involvement from your career, send your resume, specifying area of interest, to Matt McKechnie, Dynamics Research Corporation, 60 Concord Street, Wilmington, MA 01887.

An equal opportunity employer.
U.S. Citizenship required.

MIS AND DATABASE DEVELOPMENT PROFESSIONALS

NEXUS Associates has been retained by a nationally recognized "Fortune 100" financial services industry leader to locate and recommend 40-50 highly qualified MIS and database software professionals for career opportunities available over the next few weeks.

THE PROJECT WE ARE TALKING ABOUT-
"TOMORROW'S IDEAS TODAY
The hardware environment is IBM 3083 and 4341 under MVS. The on-line interactive database projects are being developed primarily on IDMS. This project involves creating an entirely new network architecture and building prototype systems that will become industry standards.

THE KIND OF PEOPLE WE WANT
We want people who love challenge, who thrive on change, are creative and self-starting. For most positions a Bachelors degree or equivalent experience in data processing is preferred. Candidates should possess top notch organizational, oral and written communication skills.

REWARDING EXCELLENCE
Talent and effort are rewarded both financially and with increased responsibility. *The compensation package is extremely competitive* - and includes company-paid benefits, savings and stock ownership plans, credit union, educational assistance, relocation, and free parking.

THE EXPERIENCE WE ARE LOOKING FOR
We are especially interested in professionals with 2-4 years of IDMS experience including hands-on knowledge of ADS/O, CULPRIT, and other Cullinet software enhancement tools. A strong background in COBOL is required for most positions and a solid working knowledge of TSO/SPF and IBM MVS JCL is preferred.

POSITIONS: Programmer Analysts/Applications Development, Technical Analysts/Development Support, Senior MIS Analysts/Data Processing Planning, Senior Technical Analysts/Configuration Management, Senior Database Administrators, Project Managers, Senior Systems Analysts/Applications Development, Senior Operations Managers.

AREAS: Database Design & Development, Requirements Analysis, Configuration Analysis/Management, Data Communications Analysis, Network Architecture, Performance Monitoring & Evaluation, Quality Assurance & Standards, Applications Systems Development, Documentation, Training, Operations.

For interested and qualified candidates, initial interviews will be arranged in your local area. For immediate consideration, please call or forward your resume in confidence to George A. Ridenour, President, NEXUS Associates, 5861 Leesburg Pike, Suite 101, Falls Church, Virginia 22041. Telephone (703) 998-6363.

FEDERAL RESERVE BANK OF ATLANTA

WE'RE COMING TO CHICAGO
ON DECEMBER 7th-9th
TO OFFER HIGH-TECH CAREERS

WITH PLENTY OF SOUTHERN EXPOSURE.

We're The Federal Reserve Bank of Atlanta, provider of wholesale banking services and support for advanced economic research and analysis. Our home city of Atlanta is one of the nation's most beautiful cities, which boasts a wonderful combination of a modern and picturesque environment. We'll be in Chicago for three days to meet you and discuss the following exciting career opportunities for computer professionals in Atlanta.

- **IMS DB/DC APPLICATIONS PROGRAMMERS/SENIOR PROGRAMMERS**

These positions require 1-3 years experience in COBOL programming in an MVS environment using IMS DB/DC, including MFS and BTS (on-line, i.e., DC programming required). In addition, exposure to JCL, PANVALET, TSO/ISPF and Dialogue Manager would be an asset, and knowledge of Assembler and IBM PC programming is a plus.

- **IMS DB/DC APPLICATIONS PROGRAMMER/ANALYSTS**

These positions require 3-5 years experience in an MVS environment conducting automated systems studies for user departments, designing systems, and providing specs for development. Strong experience in IMS DB/DC programming (COBOL) is necessary (on-line, i.e., DC programming required). In addition, qualified candidates will have had exposure to MFS, BTS, JCL, PANVALET, and TSO/ISPF. Knowledge of Assembler and IBM PC programming is a plus.

If you're a computer professional who qualifies for one of these unique and exciting career opportunities, and are interested in working in a sophisticated city with a real down-home feeling, THE FEDEAL RESERVE BANK OF ATLANTA is prepared to offer the individuals we select an excellent starting salary commensurate with experience, a superb benefits package and most of all, the outlook of a brilliant future with a great institution in a warm and healthy environment.

Qualified applicants, please call ROBERT BLAIN, DP Recruiter, COLLECT, at 404-521-8774 to set up an interview appointment. We will provide transportation to CHICAGO for qualified applicants.

HIRING?

More computer people read Computerworld than any other newspaper in the United States - more than half a million computer people every week.

And, among our 529,000 readers at user organizations, about half claim to look at recruitment ads at least every other week (only a small percentage say they never look at recruitment ads).

No wonder Computerworld carries more recruitment ads for computer people than any other publication.

To place your ad or to get a rate card with complete details on Computerworld Classifieds, call or write:

COORDINATOR FOR ADMINISTRATIVE COMPUTER SERVICES

UNION COLLEGE OF NEW YORK

The Office of Computer Services is seeking an Administrative Services Coordinator, one of three senior positions in the department. The successful candidate will have 3-5 years of data processing project management experience, a proven ability to work with individuals and groups, and very good communication skills.

The Coordinator is responsible for all administrative software and services, and oversees the activities of programming project teams involved in software development and maintenance.

Union College is a highly selective independent residential college of about 2,000 undergraduates, offering liberal arts, engineering and computer science curricula along with a small graduate program.

The College is located in New York State's Capital District Area near the Adirondacks, and the region offers a wide variety of educational, cultural and recreational opportunities.

The position is available January 1, 1985. Special consideration will be given to candidates with any of the following: an advanced degree in an appropriate discipline, expertise with the HP3000 computer system, or management experience in an academic environment. The college encourages applications from women and minority group members. Salary $27,000 to [illegible] DOE. [illegible] benefits generous. Write, including full resume plus contact information for three references, no later than December 21, 1984 to:

George R. Richards, Director of Personnel
Union College, Schenectady, N.Y. 12308

North Adams State College invites applications for anticipated tenure track faculty position beginning September 1985 to teach computer science courses at all levels. Presently we offer upper division concentrations in Software Systems, Information Systems and Scientific Systems, along with an expanded core curriculum. An M.S. in Computer Science is required with a Ph.D. preferred along with some prior teaching experience and a commitment to undergraduate computer science education. North Adams State College is a state supported liberal arts college with 2100 students located in the beautiful Berkshire Mountains. This position will continue to be open until filled. Resumes with cover letter should be sent to the Personnel Office, North Adams State College, North Adams, MA 01247. An EEO/AA employer.

SYSTEM ANALYST

Responsibilities for this position include the development and maintenance of computer software using both micro and mainframe technologies. It involves problem definition, program design, coding and testing of new software modules and analyzing and modifying previously written programs. Experience with D-Base II Software package developing business systems, using PL/1 required and a Bachelor's Degree in Computer Science. 40 Hours/week, $10.05/hour. Apply at the Texas Employment Commission, Richardson-Plano, Texas, or send resume to the Texas Employment Commission, TEC Building, Austin, Texas 78778, J.O. #3680876. Ad Paid by An Equal Employment Opportunity Employer.

FEDERAL EXPRESS

Federal Express has opportunities for you to work with our absolutely, positively, incredible technology. Rapid growth of our Electronic Products Division has created the need for the following professionals:

TECHNICAL ADVISOR PRODUCT SPECIFICATION

You will be responsible for conceiving, defining, and developing technical specifications and operational procedures for new electronic communication products and services, assessing state-of-the-art technologies and coordinating new product specifications with technology specialists and external hardware/software vendors. A Bachelor's degree in Electrical or Electronic Engineering, Math, Physics or Computer Science and seven years professional experience in technical development of electronic information products and services is required. MBA, project management and international experience is preferred.

SR. ENGINEER - SOFTWARE

You will plan, design, code, test and implement software and firmware for use in electronic mail applications. A Bachelor's degree/equivalent in Electrical Engineering, Computer Science, Math or Physics is required along with five years systems programming experience with minicomputers or microprocessors. A Master's degree is preferred. You must be proficient in real-time assembly language programming as well as high level (BASIC, PL-1, FORTRAN, PASCAL) language programming. Strong communication skills are essential.

This is your opportunity to work with a company on the leading edge of high technology. Federal Express offers a highly competitive benefits package. Please rush a letter indicating your experience and salary history. (Include your resume if you have one.)

TO EXPEDITE CONSIDERATION, CLEARLY INDICATE THE POSITION OF INTEREST TO YOU ON YOUR REPLY ENVELOPE.

When you lease equipment, make sure it comes with a good name behind it.

With the rapidly changing and improving technology of your industry, it's not always easy to keep your company's system up to date. And it's important to make sure you get the best advice, the best service, and the best financing available.

At Greyhound Capital Corporation, we've been leasing, servicing, refurbishing, maintaining and providing financing for computer and other equipment for over 20 years. And we have the resources and the knowledge to help you customize your equipment-leasing requirements. We can also assist you with the financing.

Whether you want to lease or purchase your equipment, look for the name with the kind of strength you need behind it: Greyhound.

WHY FORTUNE 500 COMPANIES LEASE FROM RANDOLPH.

1 FINANCIAL STABILITY. As an important part of the Bank of Boston, one of the nation's oldest and leading financial institutions, Randolph has a built-in financial stability that continues to be unique in the third-party computer leasing industry.

2 19 YEARS IN THE BUSINESS. Randolph has been serving Fortune 500 companies since 1965 . . . a history that gives added assurance that we'll continue as a leader in the industry.

3 HIGH-TECH LEASING IS OUR ONLY BUSINESS. Leasing computers is a lot different than leasing boxcars. Computer technology changes almost daily and with it the value of the equipment. Randolph not only keeps current on the state of the art but has learned to anticipate important changes.

4 ACTIVE REMARKETING DIVISION. Our unique customer support assures maximum return on investments in computer equipment which is no longer in use.

5 UNIQUE SERVICE. In addition to the manufacturer's service Randolph has a technical staff that is on call to help reconfigure systems to meet the changing requirements of large companies.

6 COAST-TO-COAST RANDOLPH. Even though large companies may have computer sites all over the country Randolph is right there to serve them. We presently have customers in over 300 cities and towns from Maine to Hawaii.

7 WE SPECIALIZE IN SOLVING PROBLEMS. Large companies can have a variety of problems . . . like machines installed on a rental basis, being stuck with a lease on an old machine or long waits for delivery. Whatever the problem, we can tailor a lease that will fit the need.

8 WE ARE DP PROFESSIONALS. At Randolph, our people have an average of 18 years in the DP industry . . . from 360's to 3084's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

9 WE GO BEYOND COMPUTERS. Randolph has been dealing with peripherals from the very beginning. Now we're involved in leasing communications systems and office automation equipment because that's what Fortune 500 companies demand.

10 WE SAVE THEM MONEY . . . LOTS OF MONEY. Randolph has been saving its customers 30% to 70% of their DP hardware dollars. Fortune 500 companies know leasing is still the most financially attractive method of acquiring computer equipment at low cost without draining working capital.

HOW ABOUT YOU? What we've done for so many of the Fortune 500 companies we can do for you. Call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

3270 COMPATIBLE

A T & T Teletype 4540

Remote SDLC
Standalone CRT
with Printer Port.

$1,900^00 ea.

Each of these rugged, reliable units consists of a CRT with an expanded keyboard and a built-in controller which provides complete 3270 SDLC compatibility. A controller port allows a variety of printers to operate as a 3287.

If you need a CRT and a printer at multiple remote sites on an SNA or SDLC network, this is a perfect solution at a remarkably low cost.

Built by A T & T to A T & T quality standards.

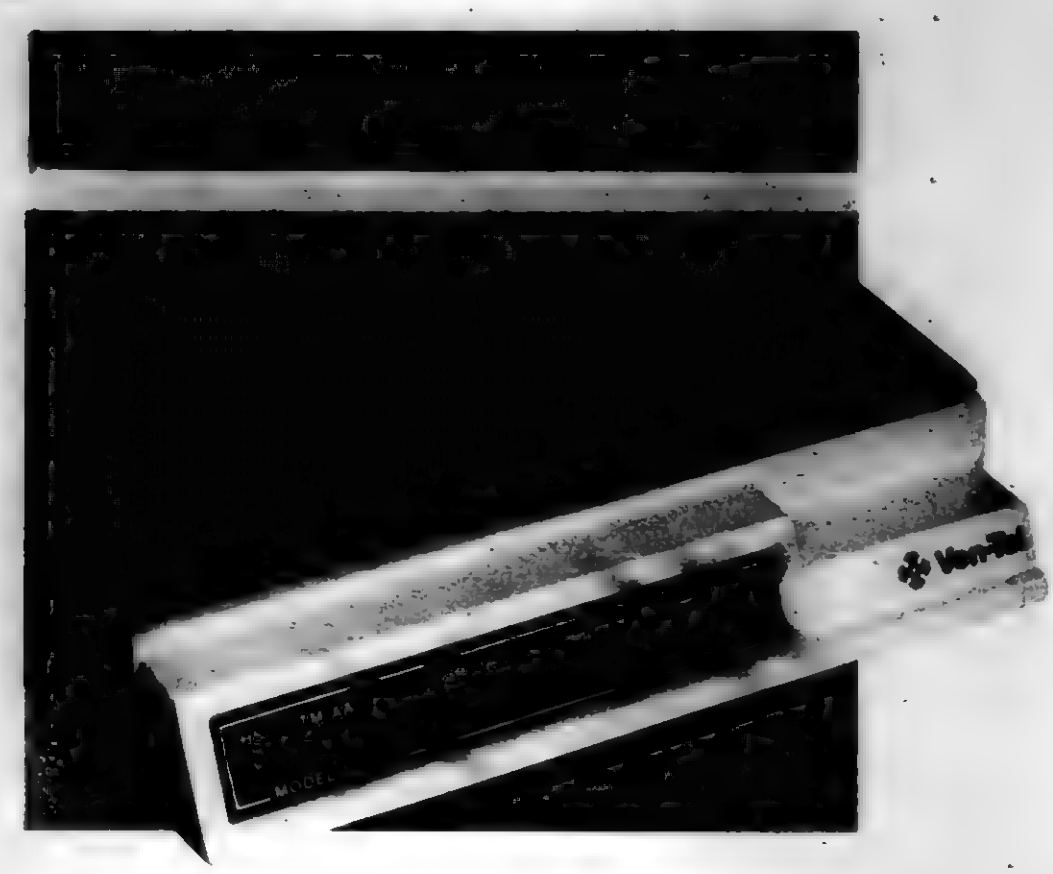
Ven-Tel's 212 PLUS

Smarter Than Smart!



Finally,
There's A
Smart Modem
For Both
Terminals *and* P.C.'s!

Two Modems in One!
Whether your work station is a dumb terminal, intelligent terminal, or full-fledged P.C., Ven-Tel's 212 PLUS is your best choice!

It's A Terminal Modem!
In terminal mode, the 212 PLUS stores your phone numbers, manages computer connections (with sophisticated dial-routing routines)—even has its own built-in HELP commands.

It's A P.C. Modem!
With a flip of a switch, you're in 'AT' mode, for immediate compatibility with all popular personal computer communications software including Crosstalk™ and Smartcom II.™

Compare!
We think you'll agree that the 212 PLUS is the smartest modem around. Call us for the location of your nearest Ven-Tel distributor.

Ven-Tel Inc.
Effortless Communications

Amdahl announces dual operating system option

Multiple Domain Feature for 580 series reportedly cuts hardware needs, saves on software licensing

By Jeffry Beeler
CW West Coast Bureau

SUNNYVALE, Calif. — Amdahl Corp. last week enhanced its 580 series mainframes with a hardware option that reportedly allows either identical or dissimilar operating systems to coexist in a CPU.

For users of the 580 series' three uniprocessors and two multiprocessors, Amdahl's Multiple Domain Feature reportedly cuts hardware requirements and eliminates redundant software licenses by consolidating control programs that previously resided on separate mainframes.

According to Henry Cassel, manager of Amdahl's 580 product program, the ability of two operating environments to occupy the same processor simultaneously can also benefit MIS organizations in the following ways:

- Spares them the trouble and expense of maintaining dedicated CPUs for production and testing.
- Simplifies upgrades to IBM's Extended Architecture or other major conversions involving control programs or application subsystems.
- Aids in creating backup systems.

Cassel described the 580/MDF as a set of microcoded logic boards that fit inside a 580 series processor's chassis. The boards replace some of an Amdahl processor's existing hardware, can be installed in the field in about eight hours and require no programming changes or software additions, he said.

Although the MDF boards contain no additional main memory, channels or other system resources, they do reportedly enable a uniprocessor to support dual copies of IBM's MVS/370, MVS/XA or VM/SP HPO

Users find new solution to old problem

Migration packages let users slide into DBMS conversions

By Charles Babcock
CW New York Bureau

NEW YORK — Companies that want to buy a data base management system, but cannot afford the cost of conversion, are finding a new way to get from point A to point B — migration software.

Migration packages allow a company to put a hierarchical or relational DBMS into use while continuing to run a standing library of Cobol programs for IBM's Vsam.

Users said the migration software intercepts a Cobol call to the Vsam files and converts it into a call that taps the new data base. The Vsam files often no longer

They switched to System/36

By Donna Raimondi
CW Staff

"Two people on a job queue and everyone's sitting there dead in the water — and it's not cheap, either." This price/performance critique was the rationale from one of several companies that recently decided to convert from an IBM System/38 to an IBM System/36 minicomputer.

The Globe Amerada Glass Co. of Elks Village, Ill., a privately owned, $20 million-a-year business, upgraded from an IBM System/3 to an IBM System/38 Model 5 two years ago, said Charles Chewning, DP manager. Since then, Chewning has been unhappy with the System/38's response time and the difficulty of obtaining software for his company's special purposes.

Chewning and the financial vice-president of the company laid out on paper what the System/38 was costing, how expensive it would be to upgrade it and what it would cost to custom-design production control software that was already available for the System/36 but not for the larger machine, Chewning said. They compared these figures with the expense of converting to a

MGM wraps up epic DP revamp

By Paul Gillin
CW Staff

CULVER CITY, Calif. — The talk of Metro-Goldwyn-Mayer/United Artists Entertainment Co. recently has been *2010*, the studio's upcoming film about contact with alien life. Meanwhile, the MIS staff has been occupied with a technological transformation that is perhaps less colorful but no less important to MGM/UA.

Since April, the department has almost entirely restructured its hardware and software operations. From an environment that was based on an IBM DOS-like

Scientist cracks knapsack public key code

By John Desmond
CW Staff

ALBUQUERQUE, N.M. — A scientist at Sandia National Laboratories here has broken a knapsack public key encryption code thought to have been the security equal of RSA Security Corp.'s code, which analysts consider the world's most secure.

Because the broken code encrypted 50 times faster than RSA's code, it was thought to have widespread potential applications.

Ernest F. Brickell of Sandia Labs won $1,000 from one of the cipher's coinventors, mathematician Ralph Merkle, who offered the prize to anyone who could break the code he helped invent in 1976. Brickell's two-year effort to break the code required finding which of 100 numbers, each 60 digits long, could be added together to yield a 62-digit sum.

Why knapsack?

The system is called "knapsack," Brickell said, because breaking the code is similar to finding the optimal way of packing knapsacks given a specified number of objects. It could more accurately be called the subset sum method, he said, because the code is based on finding a subset of a given set of numbers that adds up to a given sum.

Using Sandia Labs' Cray Research, Inc. supercomputer, Brickell said, it took just over an hour for his algorithm to break the code. The code he cracked is not in commercial use, and Brickell said he now believes its potential is dashed.

Public key encryption differs from conventional ciphers that use one algorithm to encrypt and decrypt data, such as the Data Encryption Standard, the only data encryption algorithm endorsed by the National Bureau of Standards. Specialists said the weak link of the conventional method is the secret key, which must be distributed to the intended recipients of the encrypted data and must be prevented from falling into the wrong hands.

> *'What Ernie did was really put the icing on the cake. The significance of it was that it neatly closes down the traditional approaches to basing public key encryptions on knapsacks. That line of development is futile.'*
>
> — Ron Rivest, a founder of RSA and a professor of computer science at MIT

The public key method circumvents the key distribution problem through the use of two mathematically related keys: one published in a public directory that is used to encrypt messages; the other used to decrypt messages, known only by the person receiving the message.

If the public key encryption code that Brickell cracked had been in use and someone used his method to decipher it, "It would mean that person could find out the information being sent just as fast as the legitimate receiver," Brickell said.

RSA's algorithm, the most secure public key encryption method, is based on a classical mathematical problem — factoring large numbers into prime numbers. Breaking the RSA public key encryption method would require knowing which two numbers multiply together to yield a 100- to 200-digit number.

"There's no known way to do that," Brickell said. Sandia Labs has managed to factor numbers with 70 to 80 digits, but the difficulty increases 10 times for every 10 additional digits, Brickell said. According to Ralph Bennett, chief executive officer of RSA, it would take 255 days using a supercomputer to crack a 100-digit code and 36 million years to crack a 200-digit code.

Brickell said, "We can't actually prove there's not a faster factoring algorithm, but we have faith in RSA because it's such an old problem. People have been studying it for so long, it's unlikely they'll find a faster way."

'Blows away' security

Ron Rivest, a founder of RSA and a professor of computer science at MIT, said Brickell's work "blows away" the security of knapsack methods of public key encryption. But because earlier knapsack encryption codes had been broken by Adi Shamir, another founder of RSA, the credibility of the knapsack method had already been hurt, Rivest said.

"What Ernie did was really put the icing on the cake. The significance of it was that it neatly closes down the traditional approaches to basing public key encryptions on knapsacks. That line of development is futile," he said.

Bennett said because the knapsack method and RSA's method are both public key encryptions, some in the marketplace may relate the two. "We've got a bit of a [public relations] program we've got to undertake," he said.

Knapsack encryption technically is not dead, in Brickell's view. The knapsack method devised by Merkle, called modular multiplication, effectively disguised an easy knapsack problem as a difficult one, he said. A more secure knapsack encryption system was announced by Rivest and student Benny Chor in August. "I don't know how to break that one," he said. "But nobody is ready to go out and use it, because of the fact that every other knapsack method has been broken."

Customs worker faces computer law charge

MIAMI — A 25-year-old clerk for the U.S. Customs Service apparently will be the first person indicted under a new federal law [CW, Oct.15] prohibiting unauthorized entry into government computers, according to Assistant U.S. Attorney Ron Shur.

Albert Collins, who worked at the Customs Service's financial management division, was arrested Oct. 25 and charged with accessing a government computer and modifying data without proper authorization.

Collins was allegedly writing U.S. Treasury Department checks for cohorts Patrick A. Bell, Lonzie W. Hunt and Bernice Nelson. Between August and October, the four had cashed more than 40 checks worth approximately $160,000.

Bell, Hunt and Nelson were charged with attempting to file a false claim with the U.S. government, defrauding the government and embezzlement. They each face up to 25 years in prison and a $30,000 fine if convicted, Shur said.

Collins faces those indictments and the additional charge of accessing a computer and modifying information without proper authorization. He faces up to 26 years in prison and a $36,000 fine.

TURBO

Why are SYBACK & SyncSort CMS the fastest things on no wheels?

(More technology in the tank!)

Call (201) 568-9700.

Arrange a test drive.

You say you've always had very simple tastes? All you ever wanted was the best?

Well, step into our showroom and kick a few tires! We'll show you two programs that are the Ferrari and Lamborghini of VM programs.

- **SYBACK – the world's fastest and most maneuverable backup, restore and copying program;**
- **Syncsort CMS – the world's fastest and most maneuverable VM/CMS sort program.**

What makes 'em so special? Well . . .

(1) TURBO PERFORMANCE: Have you ever stepped down on the gas in a dangerous driving situation and discovered . . . nothing? Well, that'll never happen to you with these two vehicles.

Both are equipped with our special brand of "software turbocharging." We call it FBT, which stands for Fluid Buffering Technique. Our competitors call it something else.

We discovered FBT one dark and rainy night when we were trying to find a way to speed up the movement of data in sort programs. After crying "Eureka," we applied it to our OS and DOS sort programs. The results were . . . wow!

Now we've carried that bright idea over into VM dump-restores and sort programs. And the results are still wow! Compared to any other backup or sort program clogging the nation's VM thruways today, SYBACK and SyncSort CMS will save you up to:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

So who needs all that speed? You do. If you want to optimize your VM operations, stay out of needless DP traffic jams, and make the boss happy with your throughput.

Here's what happened to one large government agency: Their backup operations used to require a full 24 hours to complete. Then they installed SYBACK. Now their backup takes – are you ready? – one-half hour!

(2) EASY HANDLING: SYBACK and SyncSort CMS are among the most flexible, user-friendly programs ever produced by anybody anywhere. That's one reason programmers love 'em. And where does it say that backup and sort operations have to be hard to be good?

(3) "MISTER SOFTWRENCH" SERVICE: We've got the best pit crew in the business. More than 85% of all customer requests are resolved within 24 hours.

If you'd like to put a little high technology in your VM tank, give us a call. We might even take your used VM dump-restore or sort program as a trade-in!

NEWS

[illegible]

CULVER CITY, Calif. — Working in data processing at Metro-Goldwyn-Mayer/United Artists (MGM/UA) Entertainment Co. here is not much different from working for any other large company.

But this work does have its share of eccentricities.

For example, several of the company's MIS staff members were recently treated to a sneak preview of 2010, MGM/UA's [illegible] science fiction film, which is not scheduled for nationwide release until Dec. 7.

Movie stars and glitter

The MIS staff is accustomed to passing film stars on the lot or dining next to them at the commissary.

Bizarre costumes are as common a sight as [illegible]

MGM

from page 1

operating system on an IBM 4341-compatible machine, the department has installed and begun conversion to an IBM 4381 mainframe running IBM's MVS/XA operating system with a full set of systems software. It has also installed a large vertical application and is in the process of installing two more financial packages. Much of the installation and testing was done in six weeks.

The migration is intended to eradicate what MIS staff admits was an inefficient hardware/software environment. The studio was processing a lot of redundant and incompatible data using programs that had been written over 20 years ago, according to Bradley Heap, vice-president of MIS.

The computer room was a study in IBM compatibility: an IPL Systems, Inc. 4446 running Software Pursuits, Inc.'s DOS/MVT/VSE operating system with Storage Technology Corp. disk and tape drives and Memorex Corp. communications controllers. Not only was service unwieldy, but the continued viability of some of the vendors was in doubt as well, Heap explained.

Shades of Big Blue

Heap joined MGM/UA in February and began to paint the company's computer room in shades of Big Blue. "I knew we needed bigger machines, and we needed to go with [IBM's] MVS," he said. Within two months, MGM/UA had placed an order for an IBM 4381 Model P3 mainframe and MVS/XA with a full complement of IBM systems software, including CICS, TSO, ISPF, RACF, HSM and Vtam, according to Heap. The company also planned to install software from a number of independent vendors, including a version of Cullinet Software, Inc.'s IDMS data base management system.

MGM/UA installed the basic operating system software in two weeks using MVS Express, a service that IBM introduced last year. Under the terms of MVS Express, IBM pregenerates systems software on a development mainframe and ships the tapes to the user site for installation.

"We defined the devices on our system and sent that to Dallas, where IBM generated a nucleus," said Gerrie Caruso, director of technical services at MGM/UA. "IBM took the nucleus and installed all program products on top of it."

Functioning in two weeks

IBM shipped MGM/UA two tapes; one contained the MVS/SP nucleus, which MGM/UA used as an initial program load to download XA. The full operating environment was functioning in about two weeks.

Caruso noted that MVS Express only covers part of the installation process. For example, MGM/UA had to customize IBM's JES 2, add TSO users and install all its non-IBM systems software.

But, she said, "Without Express, we would have had to install each product and test separately," a process that she estimated would have taken about one week for each program product.

While the systems and hardware installations were being done, the applications development group, managed by Larry Histon, director of information systems development, was planning to install three large applications.

Theatrical Film Distribution On-Line System (Dons), a program developed at Warner Brothers Studios, Inc., will be a bread-and-butter program covering MGM/UA's nationwide distribution network. It is being put into production now.

Histon's group has also begun installing Cullinet's general ledger and accounts payable systems, with completion slated for late next year.

Factors behind smooth installation

Several factors were key to the fast and relatively smooth installation, staff members said. "I personally feel you need a cooperative relationship with the vendor," Heap said.

Also critical was convincing the studio's management that fundamental changes had to be made in the way the company processed data. "I sold my managers on these concepts, and once they were sold, we sold the chairman of the company together," Heap said. Thus, the MIS budget was increased from $5 million to $7 million this year.

Staff members agreed that the most important — and most difficult — part of performing such a large conversion was coordinating the involved DP groups. That was crucial for Histon, who was planning an application that would support data entry at 18 remote sites. "We met weekly, so no one was working in his own little world," he said. "We knew exactly what hardware was on order in each city, so we could plan for software support and changes."

Since completion of the new hardware and systems software installations, users have become more actively involved with MGM/UA's DP operations, Heap said. A senior executive steering committee, consisting of the senior vice-presidents of all the company's major divisions, is now included in all major MIS plans. The committee meets regularly to receive status reports and decide on changes to the development schedule.

"We now have an accepted and approved development plan through the end of 1985," Heap said.

Test user of PBX faults lack of network power

By John Dix
CW Staff

WILMINGTON, Mass. — Without the much-touted local network capabilities, the first user of Ztel, Inc.'s so-called fourth-generation private branch exchange (PBX) found the switch to be a "plain wrapper PBX."

Compugraphic Corp., located across the street from Ztel here, agreed last summer to act as a test site for the PBX manufacturer's first product, the Private Network Exchange (PNX). Under the terms of that contract, Compugraphic, a large manufacturer of computerized composition systems, agreed to test PNX for 90 days.

Because Compugraphic did not really need a new PBX, it was agreed from the start that the switch would be operated in parallel with an existing PBX and would be removed after the test, said Dave Curreri, the company's telecommunications operations engineer.

Compugraphic is housed in ten buildings, most of which are located in an industrial park just north of Boston. Four of the buildings have PBXs, including three Rockwell International Corp. 580Ls and an AT&T Dimension 2000, which are interconnected with tie lines. Telephones in the remaining buildings are supported with off-premise extension links.

After wiring part of a Compugraphic building with the required four-wire cable, Ztel installed a 250-port PNX next to a 1,500-line 580L. Voice support with the switch was cut over two days later. Each user in the test group was given a Ztel Z28 electronic handset and the top-of-the-line Ztel electronic telephone, but also kept the standard analog telephone. Only one switch was in operation at any one time, but a technician could transfer between the two in case of failure.

Switch up 99% of time

During the 90-day test period, Curreri reported, the switch was up 99% of the time during working hours between system repairs. Ztel reportedly brought the machine down several times to update software and to make revisions to line cards. Many of these problems were ironed out by the end of the test period, and in the last 30 days the switch is said to have operated practically trouble free.

Curreri said he was pleased with the performance of PNX as a voice switch, an important watershed for a new switch manufacturer. He was not, however, "overly impressed" with its performance as a fourth-generation integrated voice/data PBX. That criticism stems from the fact that, with a few exceptions, use of the PNX did not enable Compugraphic to do anything it was not already doing with its current PBXs and data systems.

By definition — depending on the supplier of the parameters — a fourth-generation PBX has an internal local network that users can access and use as they would an independent local network. According to Ztel, software to drive the local net in its switch will be commercially available in the third quarter of 1986.

Without the local net capability, which Curreri is disappointed he did not get to test, the primary difference between the PNX and the Rockwell 580L sitting next to it was the ability to use the PNX to support terminals.

Voice/data integration tested

Voice/data integration was tested on 50 of the 250 PNX ports. Asynchronous Ascii terminals were connected through RS-422 interfaces on the back of the Z28 electronic telephones to the company's Digital Equipment Corp. VAX-11/780 and VAX-11/750 systems.

Because the PNX was configured to run in parallel with the Rockwell switch, all but three data circuits were dedicated rather than switched. Curreri said that this was done because the VAX ports are prioritized, and switching back and forth between the PNX and the 580L might mistakenly enable an unauthorized person to access a high-priority port.

Terminals in the 580L environment — pre-PNX and post-PNX — are supported with wires within the same cable used to support telephones. Each office in the company is wired with a 25-pair cable, of which two to three copper pairs are used to support data terminals. The voice and data pairs in each cable are split at centralized punch blocks and routed to either a PBX or a computer. In this way no data passes through the PBX.

With the PNX, data and voice can be supported over a four-pair wire, in which case all data is routed through the switch. This provides terminal users with some typical PBX voice capabilities. However, using the PNX as a data switch does create a single point of failure for both voice and data systems.

One thing is sure: Without the promised local net capabilities — which would enable higher speed transmissions, intelligent links between devices and greater connectivity — Compugraphic would have little incentive to turn out its present systems in favor of the Ztel product.

5 REASONS WHY
PDS*FAST* IS THE CORPORATE STANDARD AT OVER 500 DATA CENTERS

1 **DASD Space Reclamation** PDSFAST can increase DASD space reclamation by 40 to 60 percent.

2 **DASD Management** PDSFAST interfaces with ALL EXISTING DASD MANAGEMENT PACKAGES reducing elapsed times by 75 to 90 percent.

3 **IEBCOPY Usage** PDSFAST is a JCL-transparent replacement for Iebcopy. It will compress, copy and unload PDS datasets to tape or disk at 5 to 80 times the speed of Iebcopy.

4 **SPFCOPY** Provides ultra high speed compression under SPF 3.1 WITHOUT REQUIRING AUTHORIZATION.

5 **SMP Processing** Speeds up ALL LEVELS of SMP processing by 25 to 90 percent.

PDSFAST benchmarks taken from user evaluations:

	Elapsed Time	CPU Time	EXCP's	Job Cost
52 cyl. PDS Compress				
Iebcopy	57 min. 18 sec.	12 min. 27 sec.	103,466	$131.08
PDSFAST	3 min. 33 sec.	5 sec.	712	$4.22
12 cyl. PDS Copy				
Iebcopy	9 min. 14 sec.	1 min. 20 sec.	10,792	$18.47
PDSFAST	46 sec.	.7 sec.	122	[illegible]
47 cyl. PDS Unload to Tape				
Iebcopy	[illegible] min.	14 min. 52 sec.	[illegible]	$92.05
PDSFAST	4 min. 3 sec.	[illegible] sec.	[illegible]	[illegible]
3380 TSO Volume Compress 2,679 Individual PDS's				
PDSFAST Driver	11 min. 7 sec.	[illegible] sec.	[illegible]	$29.87

The PDSFAST driver interfaces with all DASD management and DEFRAG packages.

As you can see PDSFAST is *ultrafast* and *cost effective*, combining wide ranging performance benefits with transparent operation. Our users tell us PDSFAST is the most impressive performance product they have seen in years.

PDSFAST is saving thousands of dollars daily in human and machine resources at hundreds of sites worldwide. We are sure PDSFAST will benefit your installation.

For further information about PDSFAST call SEA at (212) 206-7660,
located at 150 Fifth Avenue, New York, NY 10011.

SOFTWARE ENGINEERING OF AMERICA SEA

MIGRATE

from page 1

exist, but the Vsam programs run as if they did, users of the software said.

Applied Data Research, Inc. (ADR) of Princeton, N.J., has sold its $20,000 Vsam Transparency package since May 1983 and is alpha testing a second package for IBM DL/1 systems, according to President Martin A. Goetz.

Spokesmen for Software AG of North America, Inc. of Reston, Va., said the firm has sold a dozen copies of its $10,000 Adabas/Vsam Bridge package after announcing it a month ago.

In mid-December, Cullinet Software, Inc. of Westwood, Mass., will beta test Escape/Vsam, another migration package, with the product expected to be available in mid-1985. Company officials are discussing a price in the neighborhood of $30,000, said Eugene L. Kaplan, Escape/Vsam product manager.

A Memphis chemical manufacturer, Buckman Laboratories, Inc., bought ADR's Vsam Transparency in July to use with Datacom/DB, ADR's relational DBMS. Without Vsam Transparency, it faced the task of recoding and recompiling the bulk of its program library.

"Each program would take an hour or two [to recode], but you'd have to multiply that by hundreds," said Thomas P. O'Hay, data processing manager for Buckman.

With the migration software, it will take two months to implement the relational data base fully. Without it, the task of program conversion would take 18 months to two years, O'Hay said.

"I have been through conversions before. This has got to be the least painful way of doing it," he said.

One day required for Bell & Howell's conversion

Before a migration package works, data must be transferred from the Vsam files into the new data base. At Bell & Howell Co. in Evanston, Ill., the conversion of Vsam files for accounts receivable was accomplished in a day, said Lewis R. Hoose, manager, financial and administrative systems.

Both ADR and Cullinet offer utility programs that make it easier to create duplicate files in the new data base. Hoose said Bell & Howell's Cobol copybook contains definitions of Vsam files, and an ADR utility program transfers the field names into the data dictionary.

Although the file transfer is quick, Bell & Howell spent two and a half months readying its accounts receivable programs, including the testing of how to use the new data base best, Hoose said.

The Sante Fe Energy Corp. in Amarillo, Texas, an oil and gas exploration company, is implementing a complete financial accounting system, Ogis, from American Management Systems, Inc., an Arlington, Va., software firm.

The package was designed for companies like Sante Fe Energy but requires Vsam files, and Sante Fe wanted to continue using Adabas, the Software AG data base it purchased in 1979. The answer: Software AG's migration package, Adabas/Vsam Bridge. With the Vsam Bridge, the Ogis package runs the way it was designed to and "doesn't know the data doesn't exist in Vsam files," said James A. Schulze, data base administrator at Sante Fe Energy.

In one instance, the migration software allowed a user of a fourth-generation language to migrate back to, instead of away from, Vsam files.

Like other Vsam Transparency customers, Shawnee County, which encompasses Topeka, Kan., wanted some aging Cobol programs to run against its new ADR Datacom/DB data base. At the same time, it had made a major commitment to UFO, an application development system from Oxford Software Corp. of Hasbrouck Heights, N.J. Shawnee County's four programmers were trained to use UFO and 75%, or 400, of its on-line programs were written for it.

UFO, however, was designed to use Vsam files, said Stephen L. Sherman, Shawnee County data base administrator.

The county bought ADR's Vsam Transparency but ignored its fourth-generation language, Ideal, that other customers were using with Datacom/DB. "I don't know whether ADR is going to appreciate hearing this," Sherman said, "but their Vsam Transparency allows UFO to work with Datacom/DB just fine."

CONVERT

from page 1

System/36 and decided upon the 36.

Garth Fuller, director of corporate information systems at ITT Rayonier, Inc. in Florida, has worked extensively with both systems and said that he understands why small companies are converting. The System/38 was mismarketed by IBM as a machine of great power and ease that everyone could run, Fuller said, but in reality it requires more expertise than the small shop generally has.

The advantages of the System/38 over the System/36 are the larger machine's unique, object-oriented data base technology, which small shops generally do not need, and its RPG-III language, Fuller said. The price/performance ratio shines in higher model System/38s, but not in the low end, he added.

Sysgen, Inc. of Durham, N.C., developed and sells an integrated accounting package for both IBM machines, said Gary Bowers, System/36 product manager. The accounting package for the System/38 sells for $49,995, and the System/36 version sells for less than $20,000.

"The 38 package has a lot more function, such as a purchase order system and financial modeling facility, but for less than half price you get 80% to 90% of what the big package does. For a smaller business it's more than adequate," Bowers said.

Cliff Girard, president of Girard Management Services, Inc. of San Carlos, Calif., traded his System/38 Model 5 for a System/36 about a year ago. "The 38 was just not paying off for our type of operation," Girard said. His firm develops applications software for companies with IBM System/34s, 36s and 38s, he said.

Girard now has one System/34 and two System/36s in-house. "We are probably saving $7,000 to $8,000 a month in machine and software costs and in the productivity of our staff" since trading in the System/38 for a System/36, Girard said.

Two Girard Management Services' clients in California are in the process of converting from System/38s to System/36s. The companies — both of which are in the $40 million to $50 million a year business bracket and growing at about 20% per year — are pointing to cost and ease-of-use factors as their reasons for changing machines, Girard said. Another consideration for his clients, he added, is that it takes two or three times longer to train operators and users of the System/38. In a state where job turnover is rapid, training time is important, he said.

James Woodruff, president of a privately owned, 40-employee plumbing and heating distribution company in the Midwest, is keeping his System/38 Model 5 for one more year until the machine's investment tax credit expires. After four years with the System/38, Woodruff said he is disappointed. "We're paying two times more for the 38 than for our [previous] System/34," he said, "and when all is said and done, the 38 uses 10 times more memory to run a program."

Woodruff pays close to $2,000 per month in rental and maintenance fees for his System/38, as opposed to about $250 per month that it will cost for maintenance on the System/36 after he buys it. "In my opinion, it's easier to use the 36 — the 38 has 100 commands and the 36 has half that, but that's not an advantage to me," he said, citing his one-programmer staff and 25 users. Upgrading his System/38 to a Model 7 or 8 would be like "putting good money after bad," Woodruff added.

Chewning and Bowers both used a translation package called RPG 2½ from BPS Information Services, Inc. of Cedar Rapids, Iowa, to convert RPG-III code to the RPG-II code used on the System/36.

The BPS package translated about 85% of the financial applications packages' code, Chewning said. "I wrote translations for [data description specifications] source specs and [file and input] specs that the RPG 2½ package requires for input, and it wasn't all that involved," he added. Chewning designed test programs that "had everything but the kitchen sink" in them to check RPG 2½'s effectiveness, display screens and other features, he said. Starting in January 1984, he spent most of his time translating, rewriting code and testing the converted code. The computer center shut down June 1 for 1½ days to implement the change, he said.

> *The System/38 was mismarketed by IBM as a machine of great power and ease that everyone could run.* —Garth Fuller, director of corporate information systems, ITT Rayonier

Color your graphics with the Dataproducts 8050 printer for sale, lease or rent from MTI.

- Multiple color, high-resolution raster & bit image Prism™ graphics.
- 200 cps data processing mode.
- 10 ips graphics print speed.
- 110 cps text quality mode.
- Serial and parallel interfaces.
- 35 cps letter quality mode.
- 5000-byte buffer.

The Dataproducts Model 8050 printer is one of the most economical yet highly versatile color printers available for use in today's professional microcomputer applications environment.

Whether you buy, rent or lease, MTI is the one source for all computer printers. And our prices are hard to beat. Call MTI and save.

SAS signs to take over Intel's System 2000

By Paul Gillin
CW Staff

After languishing in relative obscurity for several years, Intel Corp.'s System 2000 data base management system (DBMS) received new life last week. Intel and SAS Institute, Inc. announced an agreement in principle for SAS to acquire System 2000 and other members of the System 2000 family.

SAS Institute will assume all support activities for the DBMS, which has about 600 licensed users on IBM, Control Data Corp. and Sperry Corp. mainframes. SAS Institute will also develop interfaces between SAS and System 2000.

The agreement, which will take effect Dec. 15, covers System 2000 and related products including QX, a query-by-example query language, the Flex data base language and Report Writer. However, Intel's Idis and Fast 38 series products are not included.

"We had kept much too low a profile on System 2000," said Robert Wilson, general manager of Intel's End-User Systems Operation (ESO). "This is a move to allow us to concentrate on where Intel's direction is, and that's in microcomputers and not mainframes."

System 2000 users who were contacted by *Computerworld* expressed surprise at the announcement but were generally positive about the product's future. "I have a lot of respect for SAS. It's a good organization, and I think this [move] has good potential," said Roberta Armstrong, director of information systems and services in the student support services department at the University of Minnesota in Minneapolis.

Armstrong said Intel has added significant new features to the product in the last two years. However, "it never was a mainframe software company," she said.

System 2000 was one of those products that never seemed to find a groove in the market, observers said. A hierarchical DBMS with an unusual inverted-list access method, System 2000 boasted a number of unique features, including an excellent query language, according to Ron Ross, editor of the "Data Base Newsletter."

However, "it never was clear what Intel's intentions were," Ross said, "whether it was to establish a base to sell hardware or to get into a whole new market."

The agreement will effectively shift ownership of Intel's Austin, Texas, operations to SAS Institute. Intel also announced it will move ESO to Phoenix.

AMDAHL

from page 1

concurrently. The hardware enhancement also allows the IBM operating systems to be mixed in any combination of pairs within the same 580 series mainframes, according to Cassel.

With the MDF, each of the two coresident control programs occupies its own discreet domain — an arrangement that insulates one operating environment from the other's program bugs or similar ills.

With the help of 580/MDF's tuning parameters, a user can then divide a processor's available system resources equally or unequally between the two domains. If the domains later need to be reconfigured in response to shifting system requirements, the user can dynamically reallocate CPU resources by revising MDF's control menus from an operator's console.

Don't run in parallel

Although the Amdahl hardware enhancement, in effect, turns a 580 series machine into two virtual processors, the enhancement never allows the coresident operating environments to run in parallel. Instead, the two domains are alternately active and inactive.

At intervals predefined by the user, all processing functions within a currently running operating environment automatically cease. Control of all system resources is then relinquished to the other domain, which processes its work load for a prescribed period before again yielding CPU time to its partner, Cassel said.

During the intervals when an operating environment is active, it has access to all its processor's resources with at most a 5% degradation, he added.

For corporate MIS, MDF's potential applications include the ability to consolidate production applications and those in test mode on the same MDF-equipped machine. This allows a measured amount of main memory, channel capacity and CPU time to be reallocated dynamically to the production domain during periods of peak user demand.

When customer shipments of the enhancement begin during the second quarter of next year, 580/MDF will be available for a one-time charge of $20,000 plus a $6,000/mo leasing fee.

Amdahl is headquartered at 1250 E. Arques Ave., Sunnyvale, Calif. 94086.

Only INNOVATION (not even IBM) supports a STAND ALONE BACKUP program or provides a STAND ALONE program that supports XA mode

WHEN DISASTER STRIKES while your processor is running in XA mode or 370 mode . . .

- SAR automatically determines running mode (XA or 370)
- XA mode support saves critical time in a disaster/recovery mode
- XA mode support makes operator procedure simpler and less error-prone
- XA mode support eliminates the need to maintain an alternate IOCDS to use in 370 mode for SAR

INNOVATION's SAR provides the fastest RECOVERY.

SAR supports dumping of disk volumes, data sets, or tracks when no operating system is available.

STAND ALONE BACKUPS Since you can use the DUMP feature of SAR to backup the volume before the restore, STAND ALONE BACKUPS eliminate the need to keep a spare volume to do restores in case the system pack goes down.

VM USERS! SAR backup and restore functions are supported under VM.

Bell Labs testing faster business algorithm

By Edward Warner
CW Staff

MURRAY HILL, N.J. — Bell Laboratories has claimed a breakthrough that could cut the runtime of an important breed of business programs and allow creation of programs that currently are too complex to run at all.

The breakthrough is a new problem-solving procedure, or algorithm, for use in software for solving linear programming, which is one of the most common types of business problem solving, particularly in the oil and airline industries. Such programs are not themselves computer programs, although they are solved by mainframe software currently using the simplex algorithm.

Developed in 1947, the simplex algorithm is limited by its speed, considering no more than roughly 10,000 to 15,000 different possible outcomes as it seeks a solution. The Bell Labs algorithm, still under testing here, operates faster, and therefore can consider thousands of more — possibly as many as one million — alternatives, according to Mike Garey, head of Bell Laboratories' Mathematical Foundation of Computing Department.

Would save businesses money

This clears the way, Garey said, to development of linear programming software "that would save [businesses] a lot of money and enable them to solve problems that they haven't been able to solve with the current method."

The algorithm could also be a boon to AT&T when incorporated into software it either licenses or develops — that is if the algorithm can be patented. "It's not clear what you can or can't patent; that stuff is being looked at very carefully," Garey said. "We are aggressively exploring the things we might do to make money from this."

Linear programming, Garey explained, is "finding the right mix of how you use your resources" and is probably the most common form of programming used by businesses. It is the means an oil company uses to determine how to allocate crude oil to each refinery, a paper company uses to divide up its rolls of paper stock to fill orders without waste and an airline uses to determine which flights to assign to its flight crews each day.

Besieged by calls

Since word of the new algorithm's development leaked out, Garey's office has been besieged by calls from various businesses. Bell Labs is now testing the algorithm's performance against standard linear programs volunteered by several firms, including a flight crew scheduling program offered by American Airlines.

The crew scheduling program is being given a benchmark on the basis of computer runtime, according to Thomas Cook, director of operations research at American Airlines. Another criterion that interests American, he said, is the reported ability of programs using the new algorithm to include a larger number of possible variables. The firm's current flight scheduling program, he said, provides "good answers but not necessarily the best answers. The quality difference could mean a lot in terms of dollar savings."

The Bell Labs algorithm was developed — reportedly using a pad and pencil — by a 28-year-old mathematician, Narendra Karmarkar, Ph.D. The Karmarkar algorithm, as some have come to call it, takes a shortcut as it sorts through the potential solutions to a problem.

As Garey, Karmarkar's immediate supervisor, explained it, mathematicians can think of a linear program as the conceptual equivalent of a geodesic dome, a roughly spherical structure made up of interlocking polygons. Where the points of the polygons meet is a potential solution, and the simplex method moves about the surface of the dome from one group of points to the next, constantly improving its idea of a solution until the best is achieved.

The Karmarkar algorithm takes a shortcut. Instead of moving along the surface point to point, it starts at the center of the dome and moves toward the exterior, considering possible outcomes from the inside as it goes. Both algorithms end up at the same point, but Karmarkar's does so more quickly, clearing the way for the practical use of programs with many more possible outcomes.

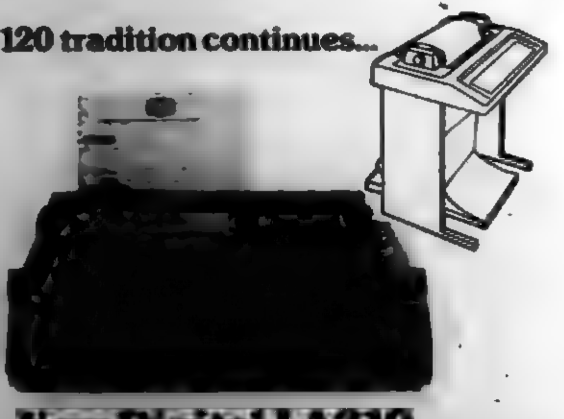
Prudence cautioned

One of the developers of the simplex algorithm, though, is cautioning prudence until Bell Labs produces verifiable test results on the new algorithm's speed. George Dantzig, Ph.D. and professor of operations research and computer science at Stanford University in Stanford, Calif., said he saw a presentation by Karmarkar on the new algorithm at an operations research conference in Texas last week, and Karmarkar "did not present any evidence on what he said it does." Dantzig, however, said he believes that his colleague can and will eventually produce proof of the algorithm's speed.

Another programming expert, Cornell University's Professor of Operation Research Robert Bland, warned that the new algorithm may, in the end, face its biggest hurdle from human beings instead of computer program variables. "When you get to, say, 100,000 variables, each specifying a level of consumption [of resources], the bottleneck is in the origin of the data."

Put simply, such programs could require an outrageously large number of data entry clerks.

The LA120 tradition continues...



New Digital LA210
-latest full-featured workhorse-
for sale, lease or rent from MTI.

- 240 cps draft printing mode.

Together at last.

When you started using your IBM PC-XT/370, you thought you had all of the power of your mainframe and a micro at your fingertips.

Soon you discovered you had to give something up... the power and capabilities of VSAM.

But now you can get VSAM and your XT/370 back together.

With Tym/VSAM, your workstation is a powerful development workstation and an applications delivery system.

In less than 15 minutes, you can have VSAM running on your XT/370 to test programs on the same workstation you used to develop them.

It's the best of both worlds... VSAM power and capabilities plus XT/370 flexibility and ease of operation.

Tym/VSAM for the XT/370 or AT/370 is available at a special price of $395 through 12/31/84.

Get your XT/370 and VSAM together again and return more power to your workstation. Order Tym/VSAM today.

The pc software to use if you have IDMS/R.

At last count, there were more than 50 integrated personal computer software packages.

But for companies with IDMS/R, we'd like to suggest that only one really makes sense.

GOLDENGATE™, Cullinet's pc software package, integrates seven components: database, spreadsheet, graphics, document processing, 3270 terminal emulation, asynchronous communication, and information manager. While the software is exceptional on a standalone basis, it offers an added benefit to pc users in an IDMS/R environment—true micro-to-mainframe integration.

Through the Information Database (IDB), the Cullinet software product that serves as a foundation for corporate information management, a GOLDENGATE user can have direct "transparent" access to all data stored in the IDMS/R database. Indeed, with GOLDENGATE, accessing corporate data is indistinguishable from accessing data on a diskette.

The
Complete
Software
Solution
Decision Support
Applications
Database

To find out more about GOLDENGATE, IDB and other components of our complete approach to information management, attend a Cullinet Seminar. To make arrangements, phone, toll-free, 1-800-551-4555.

The pc software to use if you don't have IDMS/R.

How does GOLDENGATE™ stack up against the more than 50 competitive integrated pc software packages on the market today?

With all due respect to those other packages, we'd like to suggest that it stacks up best.

GOLDENGATE's superior functionality results from its unique architecture. Each function in the program is designed to provide an optimum working environment. And each is linked to the others through core software.

The result is a functionally rich integrated pc package for business professionals. GOLDENGATE integrates spreadsheet, database, word processing, graphics and telecommunications capabilities. For use with databases other than IDMS/R, GOLDENGATE has a unique capability in combination with a standalone version of the Information Database (IDB) from Cullinet, a remarkable ability to effect effortless micro-to-mainframe integration. Integration so direct and transparent it allows the user immediate access to corporate data as needed.

GOLDENGATE, the integrated software that works better, because each of its components work better.

To find out more, we encourage you to attend a Cullinet Seminar. To make arrangements, phone, toll-free, 1-800-551-4555.

Patent office project leaving design phase

By Mitch Betts
CW Washington Bureau

ARLINGTON, Va. — The automation project under way at the U.S. Patent and Trademark Office is not only massive — perhaps the biggest in the world — but also will have several innovative features in its computer architecture, according to Jeff Cochran, the office's director of systems engineering and telecommunications.

Cochran described the Automated Patent System at a recent presentation here for the Washington, D.C.-area division of the Office Automation Society International. The system is now emerging from its design phase, and major hardware procurements will be posted this month and in 1985, he said.

The automation project, slated for completion around 1990, is expected to transform an error-prone manual system for processing new patents into an electronic filing and retrieval system for patent examiners and the public. In addition, the system will create an electronic data base from the millions of technical documents that patent examiners use to check the validity of new inventions.

CW photo by M. Betts
Cochran

"There is a massive [number] of images to be captured, stored and distributed by the system," Cochran said. "We're anticipating storage of 20 trillion to 30 trillion bytes," he said, suggesting that it may be the largest automation project in the world. Moreover, Cochran said, a large number of workstations will be required for the system: Estimates now range from 1,700 to 3,200 workstations.

In addition to the sheer size of the undertaking, Cochran said, other noteworthy features of the system architecture include:

- The system will use fourth-generation private branch exchanges (PBX) for high-speed data transfer — an alternative to local-area nets.
- The system will feature distributed processing in which each node in the network will be controlled by an intelligent microprocessor.
- All microprocessors will be connected by the Ethernet interface protocol through hardware interfaces and the Fusion software package from Network Research Corp. of Los Angeles.
- The hardware will run a hybrid version of the Unix operating system, combining features of AT&T's Unix System V, the University of California at Berkeley's Unix Version BSD 4.2 and other Unix enhancements that provide added capabilities and performance.

> *'There is a massive [number] of images to be captured, stored and distributed by the system. . . We're anticipating storage of 20T to 30T bytes.'*
>
> — Jeff Cochran, director of systems engineering and telecommunications at the U.S. Patent and Trademark Office

Cochran explained that the system's architecture stems from two parallel (redundant) mainframes that are linked to the digital PBX network and that also allocate search tasks to 193 "search engine" micros, which search through the patent text files and diagrams. Thirty interface devices link the mainframes to the PBX net and the search engines transmitting at 10M bit/sec.

Next in the architecture come three digital PBX switches that link all system components in the network, each transferring 512M bit/sec. This network includes rapid-access and archival optical-disk storage devices; 26 file servers to support such office automation tasks as electronic mail, directory searching and software distribution; and many workstations.

The design of the custom workstations was driven by user demands for fast response time on searches, high-quality screen images, user-friendly features and flexibility, Cochran said. For example, he said, the workstations will have two full-page screens (one for text and the other for diagrams), a zoom feature to enlarge portions of a diagram and keyboard, mouse and graphics tablet input devices.

Cochran said each workstation will have 2M bytes of main memory, up to 300M bytes of disk storage and a laser printer capable of printing five page/min. In addition, the workstations will have such ergonomic features as tilt-and-swivel monitors.

IT'S ABOUT TIME WE ALL GOT TOGETHER AND TALKED.

GET RESPOND® COMMUNICATIONS SOFTWARE.
IT'S HELPING CORPORATE AMERICA BRIDGE THE PC COMMUNICATIONS GAP.

Now your company's executives can get the most out of their PCs. And you can standardize your operations for greater control. Not to mention savings on training, support, software and terminals.

Designed for IBM and compatible PCs, RESPOND software integrates all the communications power you'll ever need. Its unique advantage is RESPOND Architecture™—the interface that is the basis for all our products.

RESPOND/TTY™ provides access to all major information services. Plus complete communications and data transfer capability—PC-to-PC or PC-to-mini or mainframe—anywhere in the world.

RESPOND/Async™ incorporates TTY and enables a PC to emulate such asynchronous terminals as the DEC VT100/52, IBM 3101 and the HP 2621B.

RESPOND/Sync™ is a series of products which emulate various IBM synchronous terminals using IBM or Techland Systems' Blue Lynx™ communications adapter boards (SDLC or BSC). Each emulator disk in this series also includes TTY.

RESPOND/ALL™ is the most complete package available today. It combines both asynchronous and synchronous communications in a single product.

Users can start with any one of our products. Then as needs change, upgrade to a new package. All without any new learning.

That's because *every* RESPOND product, beginning with TTY, offers all the features that make our software so easy to use. Simple menus on every screen. XPRESS keys to by-pass menus. Pre-set profiles to save set-up time. Our fail-safe HELP feature. Plus completely unattended communication—while the user's away or even running another program on the same PC. And for technical assistance, our Customer Support Department just doesn't quit.

Who's responsible for such a comprehensive line of products for corporate communications? The foremost innovators in the field:

Software Synergy, Inc.

Useful tools called key to departmental DP

CW AT HAMMER FORUM '84

By James Connolly
CW Staff

CAMBRIDGE, Mass. — The key to a successful departmental computing system is to provide "function-specific" applications and decision-support tools, said consultant Michael Hammer at a conference here last week.

Hammer told approximately 200 data processing managers at the Hammer Forum '84 that the departmental computer is more than an office automation system or the distributed processing of the 1970s, which he said was little more than using remote terminals to do centralized processing.

The hardware for departmental computing can vary according to the needs of the department, perhaps including dumb terminals, personal computers, minis, local-area nets, mainframe links and special peripherals, with up to 200 users, he said. But the software should meet specific criteria, with the goal of providing decision-support tools that let the department workers do their specific jobs better.

> *'People don't work as lone wolves in an organization. People work as groups.'*
>
> —Mike Hammer, president, Hammer and Co.

"The departmental system is an information system to support the business activities of a group of people who work together to accomplish a business mission. People don't work as lone wolves in an organization. People work as groups," said Hammer, who is president of the forum's sponsor, Hammer and Co. of Cambridge.

The characteristics of the departmental system, as outlined by Hammer, include:

- Local control and scope.
- Data base orientation.
- Some custom development.
- Analysis-, not update-, intensive.
- Relatively small scale.
- Revenue, not cost, orientation.
- Highly interactive.

He stressed that the applications should be specific for the department, rather than just generic. He cited examples such as sales lead tracking and management, portfolio management, customer profitability and vendor performance analyses.

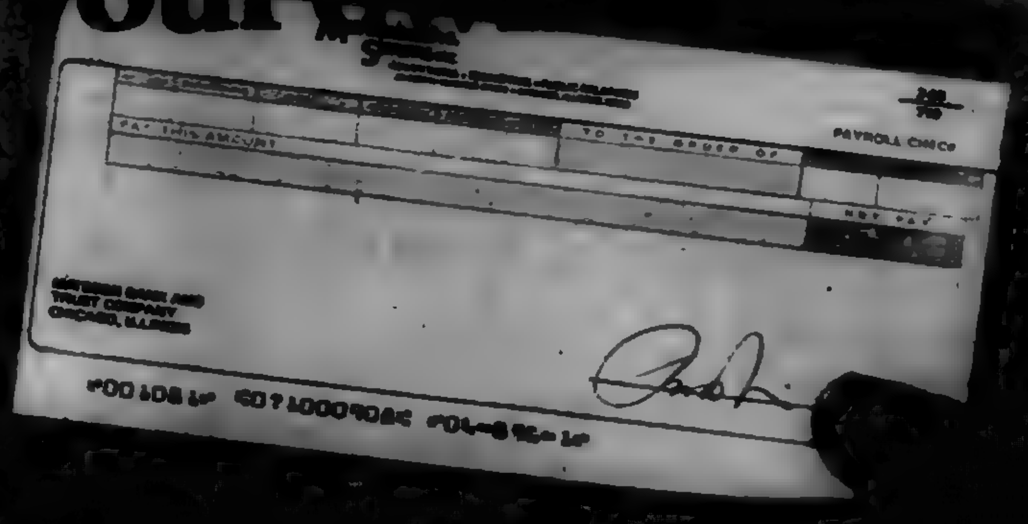
Hammer described one recent case where a department instituted a bank charge reconciliation program to monitor the fees that the company was being assessed. "In the first month, they discovered a $50,000 error in the bank's favor. That, by itself, paid for the system. You don't do bank charge reconciliation to save clerks, you do it to make money," Hammer said.

That case was typical of a departmental computing application, he said, in that it performed a task that the company never did before. He noted that traditional DP approaches have been to automate labor-intensive clerical functions, not to make money.

Hammer said that, contrary to what some industry watchers believe, departmental computing will not lead to the death of the mainframe but rather to phenomenal mainframe growth as companies require more and more disk space to support new departmental applications.

Hammer recommended common operating systems, environments and modularity that will ensure consistency and efficient communications for departmental computing systems.

If y[illegible] the kind [illegible]ation [illegible]rite [illegible]



In a time when most workers are grateful to receive cost of living increases, some data processing people are living it up. The DP industry is an employee's market with plenty of opportunities. But it doesn't mean a thing if you don't have the kind of skills and insight that On-Line Software International courses provide.

On-Line Software International has been teaching state-of-the-art courses for 14 years. Our instructors are DP experts with extensive hands-on experience in CICS, IMS, VSAM & VTAM. They have the background neces- [illegible] On-Line courses are for everyone from the up and coming programmer who wants to do well to the DP professional who is well to do.

On-Line courses are available publicly coast to coast, and on an in-house basis. So you can increase your net worth without going out of your way.

Write On-Line Software International today for course descriptions, class schedules and enrollment information. It's the most valuable coupon you'll ever cut out.

DP groups begin computer crime law efforts

By Mitch Betts
CW Washington Bureau

WASHINGTON, D.C. — The Data Processing Management Association (DPMA) and the Videotex Industry Association (VIA) have begun separate efforts to draft model legislation to curb computer crime, in preparation for state and federal legislative activity next year.

Both projects, which are in very early stages at this time, could become the basis for testimony before U.S. House and Senate judiciary committees, as well as state legislatures, officials of each association said.

Richard Cashion, chairman of DPMA's committee on computer crime, said he is collecting information on existing computer crime laws and will conduct research to determine which provisions have been successfully prosecuted and which provisions have caused significant problems for law-enforcement authorities.

Prosecutors hampered by procedures

Cashion said that even with good computer-crime statutes, prosecutors can be hampered by related legal procedures, such as "rules of evidence."

In some cases the rules of evidence will classify a copy of a computer tape or disk as merely hearsay evidence, which has little weight in a courtroom, he said.

"There seem to be a lot of problems with the rules of evidence, and we're going to take a look at that," said Cashion, who is the assistant director for data processing at Tennessee Technological University in Cookeville, Tenn.

The VIA, a three-year-old videotex and teletext trade group with approximately 140 members, recently circulated its preliminary draft of a model computer crime act, according to Robert L. Smith Jr., executive director.

VIA draft established

Smith said the draft will be revised to reflect comments from legislative and industry officials. The VIA draft bill contains these major provisions:

- Fraudulent schemes to obtain money, property or computer resources through access to any computer system, network, software or data base would be a felony.
- Intentional alteration or destruction of computer property without authorization would be a felony.
- Intentional and unauthorised access to a computer system and theft of computer property or services are misdemeanors; if the crime causes a large financial loss (unspecified in the draft), it becomes a felony.
- Intentional and unauthorized actions to obtain, disclose, publish, transfer or use a computer access device (such as an identification card or code) are misdemeanors.
- Intentional interference with or denial of computer access by an authorized user is a misdemeanor.
- "An employee, unless established otherwise, shall be presumed to have authority to access and use any computer . . . owned or operated by the employer of such employee."

Unauthorized access costly

William W. Seelinger, VIA's chairman and the manager of videotex market development at IBM, said "unauthorized access is costly for a growing number of companies and can threaten the commercial development of videotex in the home or office."

Development of the model bill arose from the VIA-sponsored "Forum on Unauthorised Access" held here in February.

Experts at the forum recommended "formulation of a model law to help both state and federal legislators deal with this serious problem, which is legally and technically confusing," according to George Minot, chairman of the VIA-sponsored forum and senior vice-president of Compusecye, Inc.

Crwth seeking users for survey

SANTA MONICA, Calif. — Crwth Computer Coursewares is seeking 2,000 participants for its second annual survey on the status of the information center.

The company has developed a questionnaire designed to identify the stages of implementation, user population, staffing requirements and responsibilities of the information center.

Another purpose is to determine the software and hardware used by the information center and to ascertain the role of the microcomputer and mainframe within the center.

Questionnaire respondents will receive a free copy of the survey findings, the company said.

Those interested in participating in the survey can mail a business card to Bibi Garcia, Crwth CBT Newsletter, 613 Wilshire Blvd., Santa Monica, Calif. 90401.

"We're saving $50,000 a year by eliminating SYSOUT printouts and installing JCLWTR."

Release 3.0 now available

That's the word from one user of AID's new JCLWTR system.

Instead of printing every production SYSOUT listing, JCLWTR stores them on disk where they're instantly accessible through special SPF screens or hard copy printouts.

The savings in paper, printing, handling, and storage costs add up so quickly that even medium and small shops can recover the system's minimal cost in just months.

JCLWTR installs on medium and large IBM systems operating under MVS and supports on-line interfaces to COM.

Find out how much you can save with AID's JCLWTR system. Send in the coupon, or call Terry O'Neill at 312/654-3030.

AID Applied Information Development, Inc.

System upgrades help state nab tax cheats

By Jeffry Beeler
CW West Coast Bureau

SACRAMENTO, Calif. — State officials here are expanding their use of computerized cross-matching, urging increased data sharing among government agencies and upgrading their hardware installations in a bid to reclaim billions of dollars in uncollected California taxes.

A heightened spirit of cooperation has overtaken state and local authorities following the Sept. 26 passage of revised legislation aimed at wresting unpaid taxes from thousands of delinquent California taxpayers.

Under the newly strengthened law, the state has declared a temporary amnesty for all individuals and corporations that have either underreported their incomes or neglected to file tax returns altogether.

Starting Dec. 10, California's major tax-collecting agencies will waive all penalties and criminal liabilities for welchers who voluntarily come forward and redress their past omissions by March 15. State officials expect the amnesty program to net $66 million in unpaid income, sales and use taxes from 130,000 delinquent individuals and businesses, according to Will Bush, a public affairs officer for California's Franchise Tax Board (FTB).

But once the amnesty period expires, the state plans to use a combination of stiffened legal penalties and improved enforcement techniques to pursue unrepentant tax cheats with a vengeance.

Agencies to cross-check records

For the first time in California history, the FTB and two other state agencies — the Board of Equalization and the Employment Development Department — will enjoy unrestricted access to each other's tax information. After swapping magnetic tapes, the agencies will cross-check the different sets of records on an IBM Series 3081G and note any suspicious discrepancies, Bush said.

Suppose, for example, that a company tries to cheat on its income tax returns by neglecting to report its sales tax revenue to the FTB. In the past, such an attempt at tax evasion might well have gone unnoticed.

But in a little more than three months, the FTB will begin to match its computer-stored tax records routinely against similar files at the Board of Equalization, which collects California's sales and use revenues. Any individual or corporation whose name appears in the latter set of data but not in the former may have some explaining to do, Bush said.

Similar enforcement measures will also be applied soon to the task of sniffing out Californians who fail to pay their real estate and business taxes. When the amnesty program ends in mid-March, county assessors' offices and city governments throughout the state will begin supplying the FTB with magnetic tapes containing their real estate and business tax records.

The FTB will then electronically cross-check the incoming data against its own taxpayer files in an attempt to spot possible tax delinquents, according to Ralph Shoemaker, assistant executive officer for the state's information services department.

But interagency data sharing and computerized cross-checking are by no means the only high-tech approaches that the FTG has recently adopted in its efforts to extract overdue payments from California's reluctant taxpayers. The state's revenuers have further strengthened their enforcement capabilities, Shoemaker said, through the acquisition of additional hardware, including:

- A battery of intelligent workstations for its auditors in the field.
- A network of automated tax-collection machines.
- A toll-free taxpayer information hot line, where state-employed telephone operators respond to tax-related inquiries with the help of on-line, 3270-type terminals.

Hardware upgraded

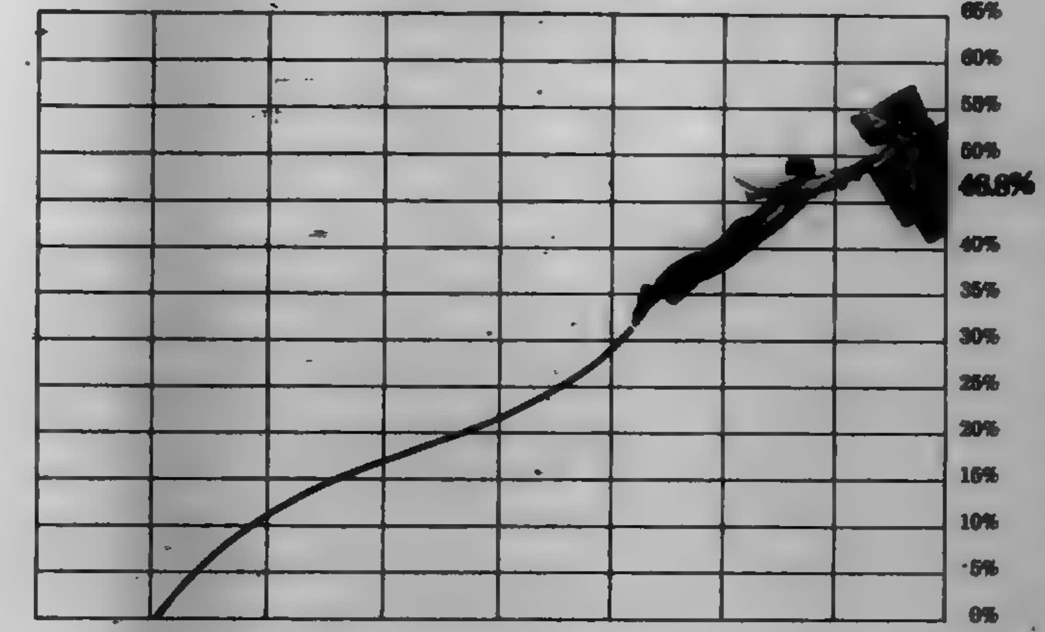
To support its improved methods of tax-code enforcement, the state has had to install additional terminals, double its central MIS site's disk capacity to 45G bytes and expand the 3081G's main memory from 16M bytes to 24M bytes. The increase in internal storage made necessary a changeover to IBM's Extended Architecture, Shoemaker said.

California's efforts to upgrade its tax-collection and enforcement methods are also forcing various state agencies to undergo data conversions to eliminate any inconsistencies in their taxpayer identification numbers.

"Until recently," Shoemaker recalled, "one of the main obstacles the state faced in collecting its back taxes was that various government agencies stored their files under different numbers and in different formats."

But once the relevant agencies complete their data conversions and assign their files common identification numbers, the barriers to automated cross-checking will quickly fall, Shoemaker said.

InterTest™ users report a 46.8% savings in CICS testing and debugging time.*



InterTest really does fly!

In previous On-Line Software International ads, we've been saying that InterTest can help you "fly" through CICS testing.

Now we've conducted a survey* among InterTest users. They report that InterTest reduces the time spent testing and debugging CICS applications by an average of 46.8%.

And that's not the only "test" we've passed. A "Datamation" study** gave InterTest one of the highest overall user satisfaction scores of any systems software product.

InterTest makes its 1,400 users dramatically more productive by automatically detecting and preventing all CICS application errors *before they occur.* With InterTest, programming errors are detected and corrected interactively without dumps, recompilations or printed listings. And our latest release makes InterTest easier than ever to install, learn and use. But don't take our word for it. Call 800-526-0272 or send in our coupon for more details. InterTest really does fly. That's not a promise, it's a fact.

Holding company micro sales recommended

By Bryan Wilkins
CW Washington Bureau

WASHINGTON, D.C. — The U.S. Department of Justice has recommended to a U.S. District Court that the divested Bell operating companies should be permitted to sell personal computers because they can be used as communications devices. The department had previously said that personal computers were outside their line of business.

The Justice Department's move would allow U.S. District Judge Harold Greene, who presided over the antitrust trial of AT&T, to approve requests by Nynex Corp.; U.S. West, Inc.; Pacific Telesis; and the other regional holding companies for permission to market micros as part of a total office automation package built around communications.

The Justice Department position follows on the heels of an earlier recommendation that the divested Bell operating companies should be able to combine the marketing of their regulated telephone service with the sale of customer premises equipment (CPE). Nynex, one of the divested Bell operating companies seeking to integrate the two functions, must obtain waiver permission since it has not been clear that micro sales can be considered part of its telecommunications business.

In the latest recommendation, sent to Greene Nov. 16, the Justice Department said micros using "widely available software and connection devices such as modems will allow personal computers and word processors to perform as data communications terminals."

The Justice Department wrote that "there is no practical way to administer a distinction between small computer systems, such as personal computers, which are today used largely as communications terminals, and larger systems that may also be used with individual workstations to perform the same function."

The recommendation that Nynex be permitted to integrate its CPE sales force with its regulated telecommunications service prompted North American Telecommunications Association (Nata) President Edwin Spievack to charge, "The Justice Department has caved in — plain and simple. The department has essentially given the [divested Bell operating companies] carte blanche to define virtually all [OA] equipment as CPE."

Nata, which represents independent equipment suppliers, has vigorously opposed the requests by the divested Bell operating companies to expand their unregulated business in conjunction with regulated service. "Ominously for the future, the department appears to have given the [divested Bell operating companies] a blank check to enter a host of new ventures without first obtaining the court's permission," Spievack said. Nata urged Greene to reject the divested companies' request to sell micros in conjunction with communications services.

Special Report now accepting net news items

Are you lost in a forest of local-area or long-haul networks? Let Computerworld's February Special Report on communications networks update you on network architectures, communications software, independent software and satellite communications.

The Special Report will focus on corporate networking choices, including the feasibility of satellite, bypass and private-line networks.

Contributions to the Special Report should take one of two forms: tutorial articles discussing issues or trends or applications stories outlining a particular user firm's experience.

Articles may range from four to six typed, double-spaced pages. Artwork, such as charts, graphs and photographs, is also welcome.

Authors should include a biography and a telephone number. The submission deadline for the February Special Report is Dec. 28.

If you have a story you would like to tell, or if you have any questions to ask, write to Janet Fiderio, Special Report Editor, Computerworld, Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

Koppel to direct Softcon '85 panel

CHESTNUT HILL, Mass. — Ted Koppel, anchor of ABC-TV's *Nightline*, will moderate the keynote panel discussion at Softcon '85, being held March 31-April 3 at the Georgia World Congress Center in Atlanta.

Panelists at the conference will include Mitch Kapor of Lotus Development Corp., Esther Dyson of Rosen Research and John Scully of Apple Computer, Inc.

Conference programs at "The International Conference and Trade Fair for Software Merchandisers, Publishers and Corporate Institutional Users" will be divided into three groups: distributors and merchandisers, corporate and institutional buyers and software publishers and developers.

Registration for the program is $30 for exhibits or $195 for conferences and exhibits.

Information about exhibits and attendance is available from Softcon, c/o Northeast Expositions, 822 Boylston St., Chestnut Hill, Mass. 02167.

WASHINGTON UPDATE
Mitch Betts
CW Washington Correspondent

Energy Department plans to create Arctic data base

WASHINGTON, D.C. — The U.S. Department of Energy recently disclosed plans for creating a computerized data base of scientific and engineering information about the Arctic that would help energy firms drill for oil and natural gas there.

The said information about Arctic ice and permafrost conditions and engineering methods to cope with them is now dispersed at many institutions.

The agency said it is seeking a contractor to consolidate the information in a user-friendly data base, which would be stored in the Digital Equipment Corp. VAX-11/780 computer at the Department of Energy's Morgantown, W.Va., Energy Technology Center.

"The ultimate purpose is to promote extensive private use of this technology base to accelerate development of domestic oil and gas resources and to assist in meeting our national energy goals," according to a statement from the Department of Energy.

"Engineers and researchers will use this information to design equipment and procedures for Arctic operations," it added.

AID seeks contract-writing software for Wang micros

WASHINGTON, D.C. — The U.S. Agency for International Development (AID) recently announced plans to automate the production of procurement, contract and grant documents and specified that the software must operate on the agency's existing set of Wang Laboratories, Inc. Professional Computers.

The system would help AID contracting officers to assemble documents from the standard procurement and contract clauses that the government uses, AID said. The agency's Office of Contract Management issues about 50 bid solicitation documents and more than 3,800 contract or grant award documents each year, it said.

The agency said it is searching the marketplace to determine if software for an automated contract-writing system is available for the Wang microcomputers.

Health agency seeking VDT study suggestions

WASHINGTON, D.C. — The National Institute for Occupational Safety and Health (Niosh) will hold a meeting Dec. 17 to gather public suggestions on how to conduct its study of the effects of VDTs on pregnant women, Niosh announced last week.

The meeting, to be held at Niosh offices in Cincinnati, will "discuss the protocol for an epidemiologic study of adverse reproductive outcomes among women using VDTs," Niosh said. Comments from industry, organized labor, academia, government agencies and the general public are invited.

Continuing concern about possible harmful radiation emissions from VDTs prompted Niosh in May to initiate a three-year study of 6,000 married, employed women of childbearing age. Half of the subjects will be VDT operators in nonmanagement positions, and the other half will be nonusers acting as the study's control group.

DOD planning research center for supercomputers

WASHINGTON, D.C. — The U.S. Department of Defense announced last week that it will establish a Supercomputer Research Center in Maryland to develop a fifth-generation supercomputer capable of parallel processing for military and scientific applications.

The center will be built by the Institute for Defense Analyses, a nonprofit organization here, under contract with the Defense Department's National Security Agency. The National Security Agency is a major user of supercomputers for intelligence purposes.

The $12 million facility will be located at the University of Maryland's Maryland Science and Technology Center near Bowie, Md.

RANDALL DAVIS

Artificial intelligence has only begun to penetrate the commercial market in the last year or two, but at MIT's Artificial Intelligence Laboratory, the technology is nothing new. For more than 20 years, the Cambridge, Mass.-based AI Laboratory has been providing the advanced research that has made AI viable. The lab is considered one of the finest AI research facilities in the world.

Dr. Randall Davis is an associate professor at MIT's Sloan School of Management and a member of the AI lab. Davis has been involved in AI research since he was a graduate student at Stanford University in 1971. He has written more than 20 articles on the subject and has spoken at dozens of conferences and forums. He specializes in expert systems, an area of AI that is receiving attention for its advances in building systems that mimic human reasoning. Davis was interviewed at the AI Laboratory by Computerworld's *Senior Editor/Software Paul Gillin.*

Q ***There has been so much talk of AI this year, but without a clear understanding of what AI is. What is your own explanation?***

My favorite explanation is contained in the book *Artificial Intelligence* by Pat Winston [director of the MIT Artificial Intelligence lab]: It is that attempt to create programs that solve problems such that if people were solving those problems, you'd call those people intelligent. It says that while we may not be able to define [intelligence], we know it when we see it.

An old example is playing chess. There are no hard and fast algorithms for playing chess, and there are far too many positions to explore them all. If you look at a computer playing a grand master, you see that the computer can explore many more positions than the human. And yet the chess experts are better at exploring possibilities wisely than the machines. The human experts are working with something other than raw speed, and that is the intelligence to know how to choose.

Q ***What do you think of the term 'artificial intelligence'?***

The whole field knows it is a terrible term. There have been several efforts to find a better one, but nobody has managed to come up with anything that everybody can agree on. I think over time its connotation will disappear because people will stop trying to read into the words and understand that it is a label for a body of research.

Q ***What kind of work is currently going on at the MIT AI Lab?***

All sorts of things. There is work in robotics, using visual manipulation to make machines see and manipulate things. There is research getting programs to learn from experience. There is research in natural language, getting machines to understand English rather than formal computer languages. There is advanced research going on in architectures. A machine is being built here that will have a million parallel processors. There is work in advanced AI languages; the lab has long worked on new ways to program, based on experience in building AI systems. There is work in expert systems.

There is also work in commonsense reasoning, that is, those things that seem so easy and yet are so elusive; for example, the kind of reasoning a child can do about simple

See DAVIS page 17

DAVIS

from page 16

stories. There is a standard example, a simple story about a birthday party where two kids are talking and one child says, "What did you get Jack for his birthday?" The other says "I got him a kite," and the first says, "He already has a kite; he'll make you take it back."

Any five-year-old child can understand what is meant by "He'll make you take it back," understanding what "it" is, why he'll make you take it back and so forth. And capturing all that knowledge, giving it to a machine and telling it how to use it is very difficult to do.

There is also another form of reasoning that allows you to understand the simple physics of the world without the formal understanding that physicists have developed. It is a natural understanding of how things spill and fly and fall and so forth, and that is very difficult to capture.

Q ***We talk about knowledge engineering a lot. What you're talking about is almost intuitive processes, things that can't be defined in a knowledge base.***

Let's not mix apples and oranges. Knowledge engineering is a term that is used in conjunction with expert systems, and those systems typically focus on fields that require a great deal of training. It is somewhat paradoxical that it is easier to mimic the reasoning processes of a highly trained adult expert than it is to mimic the reasoning of a five-year-old. Expert systems are aimed at the former category, and the work at understanding common sense reasoning is aimed at the latter category. Both are important, but they're very different kinds of research.

Q ***Which areas of AI are more advanced in terms of practical use?***

On purely pragmatic grounds, there are three areas: natural language, robotics and expert systems. Things like [Artificial Intelligence Corp.'s] Intellect is an example of a system that does a certain form of natural language understanding. Similarly, with robotics, there are some simple robots working on assembly lines; and with expert systems, there are a few applications that are out there being used. [General Electric Co.] has a system called Delta that helps them diagnose locomotive failures. AT&T has a system called ACE that helps them work on trouble with their phone systems. [Schlumberger Ltd.] has a program called Dipmeter Advisor that helps them analyze oil well logs to help determine subsurface geology.

Q ***What do you see as the main barriers today to the development of commercially viable AI systems?***

In the short term, it is the availability of skilled practitioners. There is a much larger demand for the skill in the industrial world than there are people who can supply it. And there is also the problem of industry draining off people from the academic world that, in the short term at least, makes that problem worse. If you take people out of the academic setting, who trains the next generation?

In the longer term, what stands in the way is continued progress on the basic research issues. There are certain ideas being used now. The question is what ideas are going to be used 10 years from now, and the answer is that we don't know. That is what basic research is about.

Q ***A lot of what is passed off as AI now is really a sophisticated data base, as opposed to a knowledge base. Can you differentiate between the two?***

Let me take [Lotus Development Corp.'s] 1-2-3 as an example. With 1-2-3, we know what the data base is. We know what kinds of operations we can carry out on that data base. In the hands of a skilled financial manager, one set of operations will be carried out using 1-2-3, and in the hands of a less skilled financial manager, a different set of questions may be asked. What does the expert financial manager know that the less expert one doesn't know? That is the knowledge base. It is the knowledge and judgment to know what to do with a collection of facts.

Q ***What kinds of skills do people who program computers today have to develop to think in that vein?***

In a certain sense, they are not new skills. I think a lot of the reasoning is what people have been doing for a while. A large part of the difference is understanding that you can get the machine to do the kind of reasoning you were doing to prepare the program. So instead of writing down exactly how to do something, one might write a program that figured out what to do.

Q ***Do you think there will be commercial breakthroughs like 1-2-3 in a field like expert systems?***

There are several companies trying to build tools that would let people build their own expert systems, but it'll take longer. It is a harder problem. I don't know if anything will make the splash that 1-2-3 did because the perception was that we had never had anything like that before. I think we'll see the expert system tools evolve more publicly and more slowly.

Q ***What are you personally working on right now?***

There is a fascinating style of reasoning that people do that I'd like to understand, and my research group is trying to build programs that understand it. Say I have a malfunctioning television set. I can bring it into a repair shop that has been there since televisions were invented. The re-

TOP SECRET

TOP SECRET stops computer criminals from getting into your company's data. Whether they're innocent-looking insiders from your own secretarial pool or teenage hackers just looking for kicks.

TOP SECRET's unique structure makes it easy to implement security on your own, saving time, cost and confusion. With TOP SECRET, you get maximum data protection for MVS and MVS/XA systems plus the added flexibility to match your growing security needs. Today, tomorrow and for the longterm, you can count on TOP SECRET.

And, you can count on more. A TOP SECRET Consulting Group is available to provide expert assistance in your planning or implementation of TOP SECRET security. These consultants represent years of security experience that can make a real difference to you when developing a security strategy.

Once TOP SECRET is in place, security administration is easy. So easy, in fact, that a first-time user can handle the job successfully from just one terminal. Everything that's needed is right there, on-line, with full screen menus for instant response and review.

Because TOP SECRET offers the only true phased implementation available, you get the total flexibility you need to define security at your own pace. With TOP SECRET, you can secure critical resources immediately, then implement security for the rest of your system in gradual stages without disrupting workflow or end-users.

With more than 700 systems installed, hundreds of users worldwide already know, firsthand, how easy TOP SECRET is to install. There are no hooks, no IPLS, and absolutely no modifications to the operating system required. In fact, most of our users have installed the product in less than half an hour.

So, before she makes her first move, make yours. Call [illegible] (in Florida, (813) [illegible]) for your free TOP SECRET 30-day trial today.

Printing firm relies on old-timers

Twenty-year-old printers still efficient and cost-effective

HOLLISTON, Mass. — When a 115-year-old firm here decided to add computer-controlled printing to its capabilities, it selected printers that also go back into history.

The W. A. Wilde Co. began as a book publisher in 1868 and expanded into direct marketing services in 1955. Wilde used addressed labels or envelopes supplied by customers or service bureaus and printed its mailing pieces by offset lithography until 1½ years ago.

At that time, the company investigated a number of high-speed impact printers, including models by Storage Technology Corp., and laser printers from IBM and Xerox Corp., and compared the new models with IBM's 20-year-old 1403 Model N1, said Charles Barr, vice-president of Wilde. The old IBM model was certainly slower — 600 line/min as opposed to 1,500 to 1,800 line/min for the new ones — but that did not matter to Wilde, which is not a high-volume print shop, Barr said. "The 1403 is the most cost-effective for our needs," he said. "The impact quality is still one of the best in the industry."

Wilde paid between $2,000 and $3,000 for each of its six printers and added Spur Products Corp.'s S1403/Prime controllers to enable the company's Prime Computer, Inc. 850 minicomputer to drive the printers simultaneously, Barr said.

The machines print out personalized letters, renewal forms and solicitations and process response letters for the lead management services that Wilde performs for high-tech clients in the Northeast, he said.

Repairs for the old machines are no problem either, Burr said. Parts are readily available, and Spur Products' New England office provides necessary maintenance, he added.

Peters to speak at Fose '85

WASHINGTON, D.C. — Thomas Peters, coauthor of *In Search of Excellence*, will provide the keynote address at the Federal Office Systems Exposition (Fose '85) to be held at the Washington Convention Center from March 4-7.

According to the sponsor, National Trade Productions, Inc., Fose '85 will have as its theme "Integrated Office Systems: Redefining the Bottom Line."

The conference is designed for corporate and government executives, administrative managers, information professionals, business owners and association executives.

The exposition is scheduled to feature approximately 250 companies exhibiting a variety of office systems products and services.

Many technologies on display

Among the technologies to be displayed will be data communications, telecommunications, word processing and data processing, reprographics, micrographics, electronic mail, electronic printing, networking, facsimile, dictation systems and voice messaging.

Early-bird registration, before Feb. 4, for Fose '85 is priced at $275. After that date, registration is priced at [illegible].

More information about the exposition is available from National Trade Productions, Suite 400, 2111 Eisenhower Ave., Alexandria, Va. 22314.

DAVIS

pairman stares at it, thinks for a minute, takes out a screwdriver, taps lightly on the side, and the television set is repaired.

Then I can imagine bringing it into the brand-new high-tech repair shop with the repairman who is just out of school. He pours through the schematics, thinks about how the symptoms he sees might cause the problem, says "Ah hah," pulls out a screwdriver, taps lightly on the side of the set, and it is repaired.

They have both diagnosed and repaired the television set, yet the style of reasoning is quite different. If we ask the first guy how he knew what to do, he would say, "I've seen that before, and when I tapped it on the side the last time, it worked." When you ask the second person, you get a long and detailed story about how the television set is supposed to work and how one can relate the surface symptoms to the television's underlying design.

That is the kind of reasoning we want to [study]. To some extent, I know how to build a program that mimics the former model. But we don't know how to build a program that mimics the latter. It turns out to be easier to make associations between situations and underlying causes than it is to build in the deeper understanding of why such a connection should exist. And that is what we're trying to do.

Let IBM help your end users...

so they can help you.

IBM has prepared a self-study workbook that teaches your end users how to better describe their information needs—so you can provide them with better solutions.

"Managing the Application Development Process: For Users" is a straightforward approach to the end users' role in the development process—written in language they can understand.

It takes about four hours to complete and, once completed, it can serve as a handy on-the-job reference.

Each copy costs $55.

"The computer is down."

It is ironic that when we become dependent on computers, we are at their mercy. As more and more companies go on line, the industry reliability standard of 98.5% becomes unacceptable because it means your computer is liable to go down once every two weeks, on a statistical average.

So, if you are a broker, banker, manufacturer, or businessman who relies on your computer more and more, take note: Stratus Computers are designed not to fail; not once every two weeks, or once every 200 weeks, or once every 2,000 weeks!

Debunking The Myth That All Fault Tolerant Computers Cost More.

It is a common and reasonable assumption that because there is redundancy (extra programming, or extra components) in fault tolerant computers, that makes them cost more. Where the redundancy is in expensive software, this is true. But Stratus has hardware-based fault tolerance that takes advantage of the extraordinary advances in chip technology. The result – price drops. The fact of the matter is, our hardware redundancy adds a mere fraction to our cost, and absolutely nothing to your purchase price. What's more, in overall price/performance comparisons against the top computer names, including IBM, DEC, and Hewlett Packard, Stratus was at the front of the pack, despite the fact that it included fault tolerance, while the others didn't.

	STRATUS XA400	IBM 4381	HP 3000 68	DEC VAX-11/782
RELATIVE PERFORMANCE*	125	100	64	155
PRICE	$446,350	$707,897	$437,754	[illegible]
PRICE PERFORMANCE	$ 3,571	$ 7,079	$ 6,840	$ 5,999

Relative Price Performance Index

Computerworld, August 20, 1984

All systems are comparably configured with identical amounts of memory, disk space, and communication lines. But, only the Stratus price includes fault tolerance.

Why Stratus May Be The Best Computer For The Times, For The Money

Considering its showing in overall price/performance comparisons against the most successful computers, Stratus must be considered. And when you take into account the added efficiency and security of fault tolerance, and the fact that it is the world's most powerful fault tolerant transaction processing computer, Stratus truly becomes impossible to ignore. In the 1980's Stratus simply is the right computer, at the right price. For information, contact your local Stratus sales office, or call Keith Johnson in Massachusetts at (617) 460-2188, or toll-free at 1-800-255-1515.

Stratus.

TRW learns by redoing huge on-line DBMS

By Bryan Wilkins
CW Washington Bureau

ORANGE, Calif. — Converting a data base management system (DBMS) that has evolved over 14 years to a completely new one can be a daunting challenge in anyone's career. If the data base contains 80G bytes of credit information on 120 million consumers and eight million businesses and is used daily for on-line queries, a slipup means more than lost business.

After four years of preparation, Paul Palermo, vice-president of TRW Corp.'s Information Processing Services, said there are a few lessons to be learned in making a large data base conversion, in this case from an assembly-based software language developed internally by TRW Information Processing Services, to a new Cobol-based data management system.

Until recently TRW was planning to use IMS, a DBMS from IBM, but a late series of data runs forced the company's top management to drop IMS at the last moment because of cost considerations. The decision will mean a delay in implementing the switch-over.

"These are two different systems from any angle you look at them, and we wanted to set up our new system so it would be transparent to the on-line user and produce a comparable product as the current system," Palermo recently commented.

Palermo said that IMS will be replaced with an undetermined software product, but he predicted that scrapping IMS will not have that great an impact on getting new data base management software up and running, since the company is taking a modular approach to the development of specific applications packages for its customers.

Too costly

The reasons for dropping IMS related solely to the cost projections that TRW's Information Processing Services personnel uncovered in the process of testing the IMS system.

"There were no problems with updating and accessing the files with IMS, but the models that IMS used were not as close as we wanted them to be. We found that we were going to need more storage, which means more CPU cycles, all of which means the use of more power," Palermo said.

The firm said it ultimately wants a DBMS that will permit it to develop modular higher level applications that will debut in the future.

Over the next few weeks, TRW plans to start operation of its own new system, called Rewrite, which will run parallel to the existing system. According to Palermo, whether to create a DBMS internally that would permit organized administration of a growing data base is one of the largest questions that Information Processing Services is still wrestling.

"In the past, we had to develop our own [DBMS] because our data base was so large and there were no computers big enough, and the software commercially available was not good enough. We expect the data base to grow from 80G bytes to 120G bytes over the next few years," Palermo said.

"Just handling that much data makes the storage management a very important part of our product. Make or buy is a difficult decision. We decided that we didn't want to be in the business of writing [DBMS] but would rather be dealing in applications of them," Palermo added.

The level of planning and design expertise required people familiar with writing software, and TRW repeatedly relied on outside help to tailor its implementation. "This help was instrumental. Our original design projected more CPU capacity, and the IBM model made us go back and redesign it so that we were able to save some resources."

But with a peak of 40 TRW personnel detailed to planning and implementing the switch-over, TRW found that existing documentation to aid installation of the IMS system was not enough to get the job done.

Palermo said that in hindsight, with a system approaching implementation, "Lesson No. 1 is: 'You have to make a very good assessment of your resources and capabilities before you start.'

"Seventy-five percent of most DP shops spend their time maintaining their current data base and 25% [of them spend it] on implementing new systems. There are not a lot of people around who have experience building a new data base from the ground up, and most of us tend to overestimate our capabilities," Palermo said.

"Lesson No. 2 is: 'It is a bigger job than you think because you don't know what you will find out as you proceed.' Our current system was begun in 1971. Since then we've made many modifications to the original software with the result that it is very difficult to work on. It is inefficient because of its so-called architectural contraints, to the point that it is designed not to do what it was built for.

"There are little parts and corners

Software safequards firm's credit records

ORANGE, Calif. — Keeping credit records on 120 million consumers and eight million businesses in the U.S. has prompted TRW Corp.'s Information Processing Services to implement safeguards to protect the privacy of that data.

Primarily because of the 1971 Fair Credit Reporting Act, consumers have the right to inspect and question the content of their credit history files in a data bank. At TRW, provision for this was made. For consumers, the procedure involves requesting in writing the particular record sought and paying $8 for a copy. The consumer must include his social security number and address.

According to Edward J. Brennan Jr., vice-president and general manager of TRW Information Processing Services, less than 0.5% of credit reports produced in a year are challenged for accuracy. Brennan said that if a fact in a credit file is challenged, TRW attempts to verify the item, and if that cannot be done, then the item is deleted.

If the item is verified, the customer has a right to add a statement to his file that becomes part of the credit report. According to Brennan, TRW receives approximately 750,000 requests to review credit files annually.

Another problem that has potentially serious consequences is the submission of inaccurate credit information by a TRW customer. When a credit history inquiry is received, the on-line software system automatically checks to see whether the request originated from an authorized customer. The request is then processed by a TRW software program called Accusearch, developed in the early 1970s to assure the fairness and reliability of the report.

According to TRW, Accusearch determines the statistically derived probability to resolve discrepancies that occur when different sets of data are matched on a particular individual. "When there are discrepancies in matching different sets of data in response to an inquiry, what is the probability that the person whose data is displayed is the one being inquired about? Accusearch was designed to offset as much as possible the fact that not all inquiries submitted to us are complete and error-free with consumer identification criteria," said TRW in a description of its safeguard system.

TRW said that it keeps negative credit information on consumers for only seven years, after which the information is deleted from the file. Bankruptcy information is kept on file for 10 years. TRW keeps information on 610 million transactions, of which it estimates that 10% can be considered negative information.

programming.

While doing research for their recent book,* James Martin and Carma McClure reviewed seventeen diagramming techniques and came to one overwhelming conclusion:

Action diagrams are the simplest and best method of representing structured programs.

Action diagrams combine graphic and narrative notations in a rigorous but easy-to-understand technique. The method is applicable to any size program, in almost any language.

When used to sketch out program logic, action diagrams encourage correct structured thinking. Logic errors become more apparent. Communication improves among programmers, analysts, and end users. And top-down design is enhanced, because action diagrams handle any level of logic, from systems overview to detailed program code.

Fast, full-screen editing with ACTION DIAGRAMMER™ and an IBM PC.

Working closely with James Martin, DDI has developed an action diagram editor for the IBM Personal Computer and 100% compatibles. The Action Diagrammer™ editor lets you create and update action diagrams right on the screen. You draw brackets with a single keystroke. Manipulate text with all the power of a visual editor. And expand or contract to focus on any level of detail you choose.

The net result: faster application development

With Action Diagrammer you can develop designs and programs faster, and with fewer errors. Maintenance is easier too, because Action Diagrammer enforces logic structure and provides excellent documentation.

Diagramming Techniques for Analysts and Programmers Prentice-Hall, 1984

The price is easy too — only $495

The Action Diagrammer software package sells for $495 and comes with a complete user guide, which includes a thorough overview of the action diagramming method. No serious programmer or analyst with access to an IBM PC or compatible should be without it.

Even more features

Represents logic hierarchy with nested brackets for all constructs such as sequence, selection, case, and repetition. Can also represent database actions and subprocedures

Automatically supplies control structure syntax in English, COBOL, PL/I, FORTRAN, C, Pascal, and many 4th generation languages including FOCUS, RAMIS, NOMAD, MANTIS, IDEAL, NATURAL, and ADS/O

Offers one-stroke commands and user programmable function keys

Shifts mainframe software development to PC's

Allows color coding of diagram sections through user control of text and bracket colors (for users who have a color monitor)

Includes ample help messages and other on-line documentation

Produces hard copy of action diagrams on any IBM PC-compatible printer. Graphic output on IBM graphics printer or HP7470A plotter

Computer show to target design professionals

NEWINGTON, Conn. — "A/E Systems Report," a newsletter on automation and reprographics in professional design firms, will sponsor A/E Systems '85, a computer and reprographics show for design professionals, June 3-7 at the Anaheim Convention Center in Anaheim, Calif.

The sponsor, based here, expects more than 15,000 architects, engineers, interior designers and facility managers to visit the estimated 1,000 booth exhibits and 150 educational sessions. The show theme will be "Building a Better Working Environment."

The basic price for eight seminars is $195. Other show-related prices will be set in the coming months.

Information is available from the Conference Director, A/E Systems '85, P.O. Box 11318, Newington, Conn. 06111.

TRW

from page 22

of the current system in existence that people have forgotten what they were for. Things were layered around the outside in order to avoid internal repercussions if major changes were made. This is safe but in the long run inefficient," Palermo commented.

In retrospect, Palermo maintained that "It is easier to develop a system from the ground up than replace one in existence" because conversion of an old system presents a problem for users.

TRW Information Processing Services will have its two systems, the old and the new, running side by side for at least six months. "This is the most expensive area of the entire exercise," Palermo noted. However, there is a small silver lining in that although the two DBMS require duplicate hardware expenses, the duplication will mean only one year's worth of expenses being moved up.

Palermo's final word of advice is: "Don't cut over to your new system until you are sure it is ready." In this case, TRW will test its new system against a benchmark — the old system it is phasing out.

NEWS

Volatile micro market frustrates DP trainers

By Maura McEnaney
CW Staff

PHILADELPHIA — With products and standards changing almost overnight, today's data processing trainers are in an uphill struggle to keep pace with microcomputer training needs.

During spot interviews at the recent Fifth Annual Data Training Conference and Exposition here, trainers told *Computerworld* about their efforts to deal with the changing microcomputer market, the volatility of available funds for training and company fragmentation of training responsibilities.

A feeling of frustration also came through at seminars held during the three-day conference, which drew more than 900 registrants, 300 exhibitors and 60 speakers.

"I don't know how to estimate what I need," said Cyndi Tucker, education coordinator for Conoco, Inc.'s Computer and Telecommunication Services department. "Should I be active or reactive?"

For now, a reactive approach works best at General Electric Co., according to Alan Schwartz, training specialist. Because personal computer needs are hard to determine, Schwartz said, GE's micro training is geared toward "what's popular. . . . Maybe that's a cop-out," he added, but for now, there are few solutions.

Training for variety of products

Most of the trainers agree that by the time a company can develop a training curriculum for their employees, a newer product is on the market and is being accepted just as quickly as the one for which they developed material. As a result, trainers are implementing training that will teach end users how to adapt to a variety of products.

Employees at Johnson & Johnson are taught a "generic awareness" of systems, according to Lois Carducci, a data trainer specializing in personal computers. Her company's micro training program for all levels of employees is only two months old. In that time, the company has used questionnaires to try to determine a user's needs, Carducci said. But because of the time involved in developing educational products and materials, employees have turned to other methods.

'My budget corresponds to corporate profits every time. Two years ago, my budget dropped 50%; today, I have megabucks.'
— Donald Frabutt, trainer, Ford Motor Co.

An intense variety of training needs and an improved economy have fueled corporate budgets for educational services over the past several years, according to Nancy Weingarten of Warren-Weingarten Publications, Inc., conference sponsors and publishers of *Data Training* magazine. As a result, many of this year's attendees brought with them a purchasing power that was absent years ago, she said. But the volatility of those budgets remains a concern for educational personnel.

"My budget corresponds to corporate profits every time," said Donald Frabutt, a trainer at Ford Motor Co. "Two years ago, my budget dropped 50%; today, I have megabucks." Management sometimes does not recognize that increased productivity through training is more often needed in periods of decline, he noted.

The increased emphasis on office automation and data processing has caused several companies to decentralize training functions, creating problems for the training manager, attendees said.

At the Federal Reserve Board in Washington, D.C., training administrator Walter Davis said data education is done in several different departments, including office automation, data processing training and human resource and development departments. He added that his organization needs someone to outline objectives for the entire training program.

Today's trainer is more sophisticated about technology, and their departments are more organized, Weingarten said. "Training is a recognized profession now."

CAD expo to discuss technology

NEW YORK — Computer automation in electronic design, testing and manufacturing will be topics discussed at the Cadcon West '85 Conference and Exposition at the Anaheim Convention Center Jan. 14-17 in Anaheim, Calif.

The four-day conference will include tutorials, technical sessions and workshops on computer automation technology. Topics to be discussed include computer automation selection, evaluation, start-up and expansion; microcomputer-based computer-aided design (CAD); managing the growing CAD facility; and exchanging data among computer-aided design and manufacturing systems.

Registration for the program is $365 before Dec. 28 and $395 thereafter.

More information on the conference is available from Morgan-Grampian Expositions Group, 2 Park Ave., New York, N.Y. 10016.

Interpersonal skills urged

By Maura McEnaney
CW Staff

PHILADELPHIA — Information managers must shed their departments' technical image and concentrate on perfecting interpersonal skills if they expect to survive in the changing MIS environment.

According to Richard DeFiore, president of Systems Management Associates in New York, "The microcomputer explosion is changing the entire complexion of the roles and responsibilities of the MIS function." Managers must learn to develop better listening and communications skills in order to work effectively with end users, he told attendees of the Fifth Annual Data Training Conference and Exposition here recently.

DP managers were once looked upon as "technical gurus," but micros have slowly changed that image, DeFiore said. It is up to company training departments to help MIS departments treat their clients as partners, not adversaries, he said.

Attempt to manage DP functions

"Too many people in the MIS organization are looking to hold on to control [of all DP functions]," he said. "With the [personal computer] explosion, there's no way to control it. However, you may be able to manage it . . . ."

To keep up with these changes, data trainers must educate DP professionals in several critical areas, DeFiore said. Helping the MIS professional get a better perspective of the business is one key area, he noted. Trainers must also help the MIS practitioner turn his loyalty to the profession into loyalty to the company.

"Three years down the road we are going to have to have team players, not individual achievers," he said. "It is the trainer who must help develop a team spirit [among technicians and users]."

When people are involved in change, conflicts are inevitable, DeFiore said. However, the method of handling conflict can be the difference between success and failure, he said. "Too many of you spend too much time seeking hardware and software solutions and not enough time dealing with [people problems]."

The consultant suggested that companies work toward establishing an MIS culture, where open communication, innovation and productivity play an important role.

"Switching personnel between MIS and end-user departments will give DP professionals empathy" for other department concerns, he said. You are in the innovation business," DeFiore told the group, "tax people's brains, allow them to participate" in problem solving.

OA systems strategy '85 conference topic

ATLANTA — Howard Anderson, managing director of the Yankee Group, will be the keynote speaker at the 1985 Office Automation Conference to be held from Feb. 4-6 here at the George World Congress Center.

Anderson's address is titled "Integrating Office Automation Systems Strategy and Tying-In With Corporate Strategy." The Yankee Group is involved in market analysis of the computer, communications and OA industries. Anderson overees four groups for Yankee: communications/information systems, critical path, home of the future and factory systems.

The conference is aimed at professionals and managers who need to evaluate current technology, new products and industry trends. Forty-eight technical sessions have been organized into six tracks on the conference theme of "Today's Partnership: People & Technology."

Exhibitors will include representatives from telecommunications, software, OA, computer systems, personal computers, data base management and information service, peripherals, computer graphics, consulting and publishing concerns.

OAC '85 is sponsored by the American Federation of Information Processing Societies, Inc. (Afips).

Advance registration for the conference is $125, and registration on-site is $150. More information on the conference is available from Afips, 1899 Preston White Drive, Reston, Va. 22091.

Publishing meeting set

CHICAGO — The Corporate Electronic Publishing Systems: a Conference/Showcase will be held Jan. 8-10 at the Hyatt Regency Chicago at Illinois Center.

Sponsored by the Cahners Exposition Group of Stamford, Conn., the conference is designed to inform executives of the latest developments in electronic publishing.

The keynote speaker on Jan. 8 will be Robert Adams, president of the Xerox Systems Group in El Segundo, Calif. The exposition will be open all three days of the conference.

Conference registration costs $695 for three days and $295 for one day. Admission to the exposition is $15 at the door or $5 for preregistrants.

For information contact Corporate Electronic Publishing Systems, 999 Summer St., P.O. Box 3833, Stamford, Conn. 06905.

Join The Leader

...and be a Leader!

MicroAge is the computer solution leader. Throughout the United States and Canada, businesspeople rely on MicroAge for advice, leading products, and service when computerizing their companies.

But remaining the leader takes talented professionals who are willing to invest in their own community. People who are willing to assume a leadership position. That's why MicroAge is meeting with individuals who want to own and operate a MicroAge store.

Owning a MicroAge franchise is more than running a store. We sell multi-user systems, local area networks and telephone systems... along with personal computers. We provide service, installation and training for our customers.

If you would like to develop a long-term relationship serving the business in your area, let's talk business! Call or write:

"The Leader in Multi-User Technology"

BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341/II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited.* For early enrollment or more information call Dave Shapiro (212)564-8147

SYS-ED™

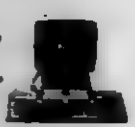
Compared to Data General's desktop, the IBM PC-AT seems a little empty.



If you need a networked multi-user micro system today, there's no comparison.

Data General's DESKTOP GENERATION™ has delivered for over a year the multi-user applications that the IBM PC-AT only promises.

What can Data General deliver today? Distributed data processing. Connectability to other vendors' equipment, including IBM mainframes. Fully integrated office automation, using our CEO® systems.

Can you get all this from the IBM PC-AT?

It's anyone's guess when the IBM PC-AT will have all the capabilities Data General's DESKTOP GENERATION gives you now. So in today's business battle, don't get caught using yesterday's technology.

Choose Data General. And choose productivity over promises. For more information, call 1-800-DATAGEN.

Vendor Supplied Features	Data General Model 30	IBM PC-AT Model 99

Link developing in Canada

Telecom Canada hoping to tie retail POS systems into nationwide electronic funds transfer network

By James Connolly
CW Staff

OTTAWA — Telecom Canada, an association of Canada's nine largest telephone companies, is developing an architecture to tie retail point-of-sale (POS) systems into a nationwide electronic funds transfer (EFT) network.

The plans by Telecom Canada, outlined in a recent address by Senior Vice-President Mike Corlett, include development of standards for POS systems and, eventually, an EFT switching system run by Telecom Canada.

> *'We're proposing that Telecom Canada provide data transmission, network switching and network management. . . .'*
>
> — Mike Corlett, senior vice-president, Telecom Canada

"We're proposing that Telecom Canada provide data transmission, network switching and network management, working in a cooperative effort with the retail and financial communities. A nationwide network that allows separation of individual systems is the answer," said Corlett in a speech to the Payment Alternatives Communication Exchange, a coalition of retail, financial and vendor organizations.

Later, expanding upon Corlett's remarks, Telecom Canada industry manager-retail, Pierre Taillefer, noted that Telecom Canada is in a position to establish nationwide POS standards because it has nationwide involvement in telecommunications. Taillefer contrasted the Canadian approach with that of the U.S., where, he said, regional POS systems have developed largely by being "piggybacked" with other services.

Taillefer, stressing that his company is not currently installing an EFT switch, said Telecom Canada expects to outline POS standards in early 1985, addressing how to best use existing technologies.

He said a natural approach would be to have Telecom Canada's existing Dataroute digital transmission network and Datapac packet-switched network play key roles in a nationwide POS network.

Canada is unique in that it is a large country with a small population spread across a 3,000-mile band and with only five major banks serving most of the nation, according to Taillefer. He estimated that 220,000 Canadian retail outlets offer credit card service and that a nationwide network could service that group. He said the nationwide network would connect, not compete with, the POS systems that many of those retailers are developing.

Aussies line up distributorships at Comdex

By Susan Mahoney
CW Staff

LAS VEGAS — Anton Mayer measures the success of a trade show by how many sales and distributorships he can line up. Mayer was happy with the way things were going at Comdex/Fall '84 held here recently, noting that "attendance is down, but the [high] quality of visitors is still very much here."

Trade Commissioner and Consul Mayer led the Australian Department of Trade's contingent of eight venders to Comdex. The government-paid booth at the show was intended to showcase Australian wares and to entice dealers in the U.S. to represent Australian products.

"This is my third Comdex, and I've noticed a lot of empty spaces here," Mayer observed. "Several companies have gone out of business since the time they bought their exhibit space. You could still buy main hall exhibit space last week because it wasn't being used.

"I think the U.S. computer industry is going through a period of rationalization right now," Mayer theorized. "It seems to be thinking more about where it spends its R&D dollars. Development in software, for example, is so expensive that it's only the big companies that can do it," he said.

When asked if this period of rationalization was mirrored in Australia, Mayer said it was not. "In Australia, the growth curve of the industry is still going up. In the U.S., it's flat because of the shakeout."

Mayer said the Australians were making their mark in the IBM-compatible software and peripheral arenas, and both industries were making healthy strides. "IBM is the de facto standard in Australia, so we tend to concentrate on serving this market."

Mayer said that while Australia is feeling the Japanese presence, "Japan is 10 years behind the U.S." He added that Japan was making a "hard push" in Australia; it was not, however, importing Australian products nearly as much as Mayer would like.

"With the U.S., the information flow and the flow of technology is a two-way street. We sell about $3 billion worth of products every year to the U.S. and buy about $6 billion."

Lamenting that very large computer contracts were still going to U.S. vendors, Mayer said, "You can't buy a product if it is not as good and more expensive than another one — no matter how nationalistic you might be. It's too bad, but that's the way it goes."

NBS issues standards directory

WASHINGTON, D.C. — The National Bureau of Standards has issued a directory of standards developed by trade associations, technical and professional societies, federal agencies and state governments.

"Standards Activities of Organizations in the United States (SP-681)" summarizes the activities of more than 750 organizations in the U.S. as well as 420 private sector groups. The directory also contains a list of 632 nongovernment groups that develop standards, contribute to the standardization process or are sources of documents and information.

The standards directory, stock number [illegible], is available for $13 prepaid from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

PC World Expo set for Houston Jan. 16-18

HOUSTON — The PC World Exposition will be held at the Astrohall here on Jan. 16-18. This year's show, sponsored by CW Communications, Inc.'s *PC World*, will emphasize personal computer implementations and software applications products for business users in vertical markets, the sponsor said.

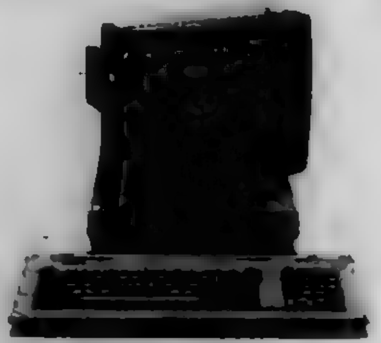
Conferences will be presented on networking, software for various industries or offices and the packaging, marketing and distribution of personal computer products. Four hands-on centers will provide experience with personal computer products.

The admission for conferences and the exposition is $35, and admission to exhibits only is $15. More information is available from PC World Exposition, Mitch Hall Associates, P.O. Box [illegible], Westwood, Mass. [illegible]

18 Reasons We're Uniquely

1 There's our position on the bottom line. Simply put: No one can match our emulations, editing and ergonomics for $549.
Can anyone better this price?

2 Only at the expense of features. Often it's obvious where they've cut corners:
With a pug-ugly box.
But as you can see, the Ampex 210 is sleekly ergonomic.



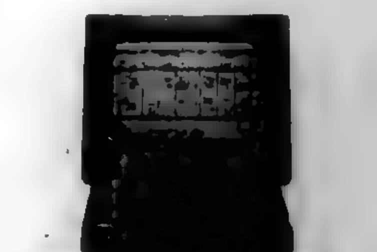
3 We human-engineered the Ampex 210 with a full 14" screen that tilts and swivels to just the angle you need. So it's comfortable to use, no matter how you're positioned.

7 As well as the local editing and block mode transfer capacities you need to speed work flow.

8 Plus 16 resident emulations you can switch at the touch of a key. Including the TeleVideo 910, 910+, 912, 920 or 925*..

9 The Lear Siegler ADM 3, ADM 3A, 3A+ or ADM 5*..

13 What's more, we'll add more. In OEM quantities, we'll customize our 210's appearance, personality and programming so it's perfectly suited to your needs.



14 And if you need a more powerful terminal with even more features, consider the next step up in our family of terminals: the Ampex 230.

15 We back every Ampex terminal with a six month warranty and a worldwide service network.

Singapore unplugs electronic bulletin board

By Abdul Rahman
Special to CW

SINGAPORE — This country's first computerized bulletin board service has been shut down because it was said to violate regulations governing the use of the national telephone system.

The bulletin board functioned like a public notice board, allowing people connected to it to send and receive electronic messages and exchange public domain software. To access it, users simply connected their terminals to the service via a modem.

Stephen Saftler, the man who introduced the service, said that since the bulletin board started in June, it had attracted about 300 users here — 100 of whom are regulars.

"This is a free, no-strings-attached, not-for-profit computer system intended to increase people's knowledge of computers," he said. Throughout its operation, interest in the bulletin board had steadily increased, according to Saftler, and there had been very few abuses of the facility.

The bulletin board service is micro-based, and messages are stored on two Control Data Corp. 8-in. disk drives and two half-height drives for a combined storage capacity of 5M bytes. To access the bulletin board, users need Bell Laboratories 103, 212 and CCITT V.22-compatible 1,200 bit/sec modems.

Telecoms inspection

Saftler explained that three officers from Singapore's Telecommunication Authority (Telecoms) visited him recently to inspect his installation.

"They found it to be quite to their liking and properly licensed," he said. "However, we were in disagreement about three of the items outlined in Telecoms Datel Service Agreement."

Saftler said the terms covered the provision of telecommunications services by the subscriber to others, using the modem to communicate with others and using non-Telecoms equipment to provide switching services without prior written consent from Telecoms.

He has admitted that he violated some of the terms and said he would write in for formal approval to operate the service.

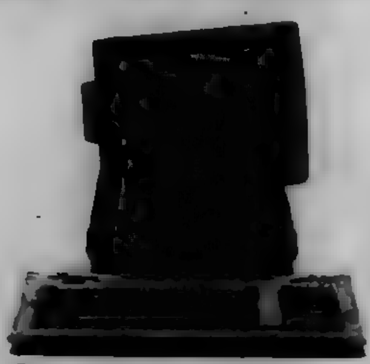
Saftler, who came from Boston in February, is technical support manager of LTX Corp., a producer of semiconductor test equipment. He said he had no problems when he had previously operated a similar service in Boston that had around 3,000 callers from 39 states.

Rahman is an associate editor at The Asian Computerworld, *a sister publication of* Computerworld *with offices in Hong Kong and Singapore.*

Positioned to Meet Your Needs.

4 We also equipped it with a low-profile, Selectric-style, adjustable-slope keyboard for easy typing.

5 And with a soothing, flicker-free amber screen for easy reading. (If you prefer, you can have the option of green at no extra cost.)



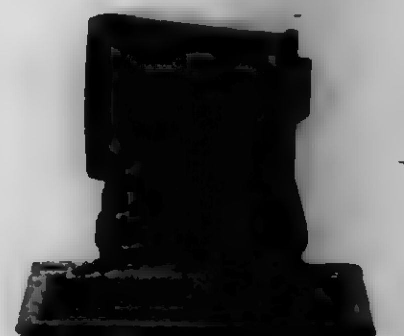
6 But ergonomics are just the beginning. The Ampex 210 is as beautifully engineered inside as outside. With line graphics and a bidirectional printer port as standard features.

10 The Esprit (Hazeltine) 1400, 1410 or 1500*..

11 ADDS Regent 20, 25 and Viewpoint.†..

12 And Qume's QVT 102*

16 How can we pack all that into the Ampex 210 for just $549? We're in a position to be competitive. We can take advantage of over 25 years of video, computer peripheral and offshore manufacturing experience.



17 So if you need a well-designed, full-featured terminal, call us at 800 621-0292. Or 800 821-9473 in California. We'll show you how you can be very comfortably situated for just $549.

AMPEX

18 The Ampex 210 is from the Computer Products Division of Ampex Corporation. One of The Signal Companies

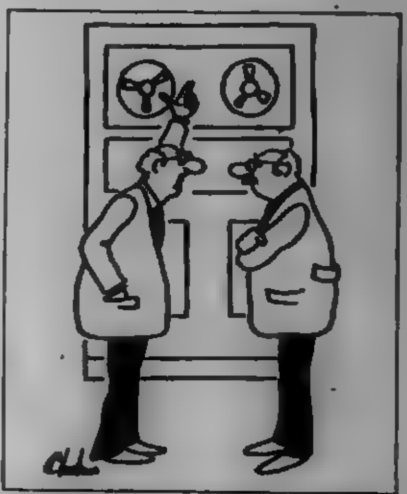
Japanese fair set to welcome U.S. vendors

NAGOYA CITY, Japan — As many as 200 American firms, many in high-technology fields, are expected to register for the Made in USA Fair to be held here March 11-14, according to the fair's sponsors, the U.S. Department of Commerce and the Japan External Trade Organization (Jetro).

Among those already planning exhibitions are Amlab International; Hershey International; and Xport, the trading company of the Port Authority of New York & New Jersey, Jetro said. The fair is intended to stimulate U.S. exports to Japan, the trade agency added, by allowing U.S. firms to exhibit before a large Japanese audience.

Over 10,000 Japanese buyers are expected to attend the show, according to a Jetro official. The show will take place in the 80,000-sq-ft International Exhibition Hall here, where facilities will be provided free. However, vendors must bear the travel and shipping charges.

Jetro is located at 1221 Ave. of the Americas, New York, N.Y. 10020.



'We were going to call our computer system the Titanic — but the Titanic only went down once!'

UK software specialist supports IBM's System/38

Company considers advantages of DBMS capabilities when developing software

By Jane Lawrence
Special to CW

LONDON — Mike Newman does not just like his IBM System/38 mid-range machine — he loves it. He can praise its data base management capabilities for hours. Recent announcements from IBM, indicating continuing support for the machine, made him very happy.

Insight Database Systems' (IDS) managing director is, in fact, more attached to his System/38 than most. Before starting up IDS, Newman spent 10 years with IBM — most of which were spent working on the development of the machine, which is now approaching its sixth birthday.

He left IBM in 1979 and set up IDS to be a System/38 software specialist company. The firm now has 260 users of its Insight financial software in the UK alone and 550 worldwide.

The company opened its doors five years ago with four people, private financing and revenues that amounted to practically nothing. By 1981, the staff numbered 15, and sales swelled to $1,008,000. Currently, Newman employs almost 50 people, and 1983 sales were $1,764,000. IDS established an office in New York, and development work is being carried out in Ireland.

The Insight software products have grown from financial modeling to include financial management, banking and insurance systems. Each of these systems takes advantage of the System/38's data base facilities — the only IBM machine with an embedded data base management system.

Insight encompasses modeling, general ledger, accounts paid and received and, as of recently, a facility called Databridge that links data from an existing user's software to the Insight range.

But Newman is admittedly not through developing Insight, and he listens carefully to any user criticism of the product. "We realize users need to be able to work with their data," he said. "It's a general malaise with software — data needs to be able to be consolidated and often can't be.

"Everyone is trying to solve such problems, but we feel we're at the leading edge and can do something about [them]," he said.

Another upcoming development at IDS is a product for the IBM Personal Computer. Soon users will be able to work in the System/38 mode while connected to the central machine or in the Personal Computer mode when the micro is not connected, according to Newman.

"This means the System/38 is freed for data handling — the thing it's good at," Newman explained. "Power-draining tasks like financial modeling can then be done on the [Personal Computer] using its local processing abilities."

> *'A software house that is not selling hardware could be left out in the cold; . . . its new market will be subcontracting to the agents.'*
>
> — Mike Newman, Insight Database Systems

In terms of hardware, Newman said he believes "you're nowhere if you're not an IBM agent." And his relationship with the giant American vendor is highly important to him. "We have, after all, an exclusive emphasis on IBM systems," Newman pointed out and said that he wants to establish his company as a major agent for IBM in 1985.

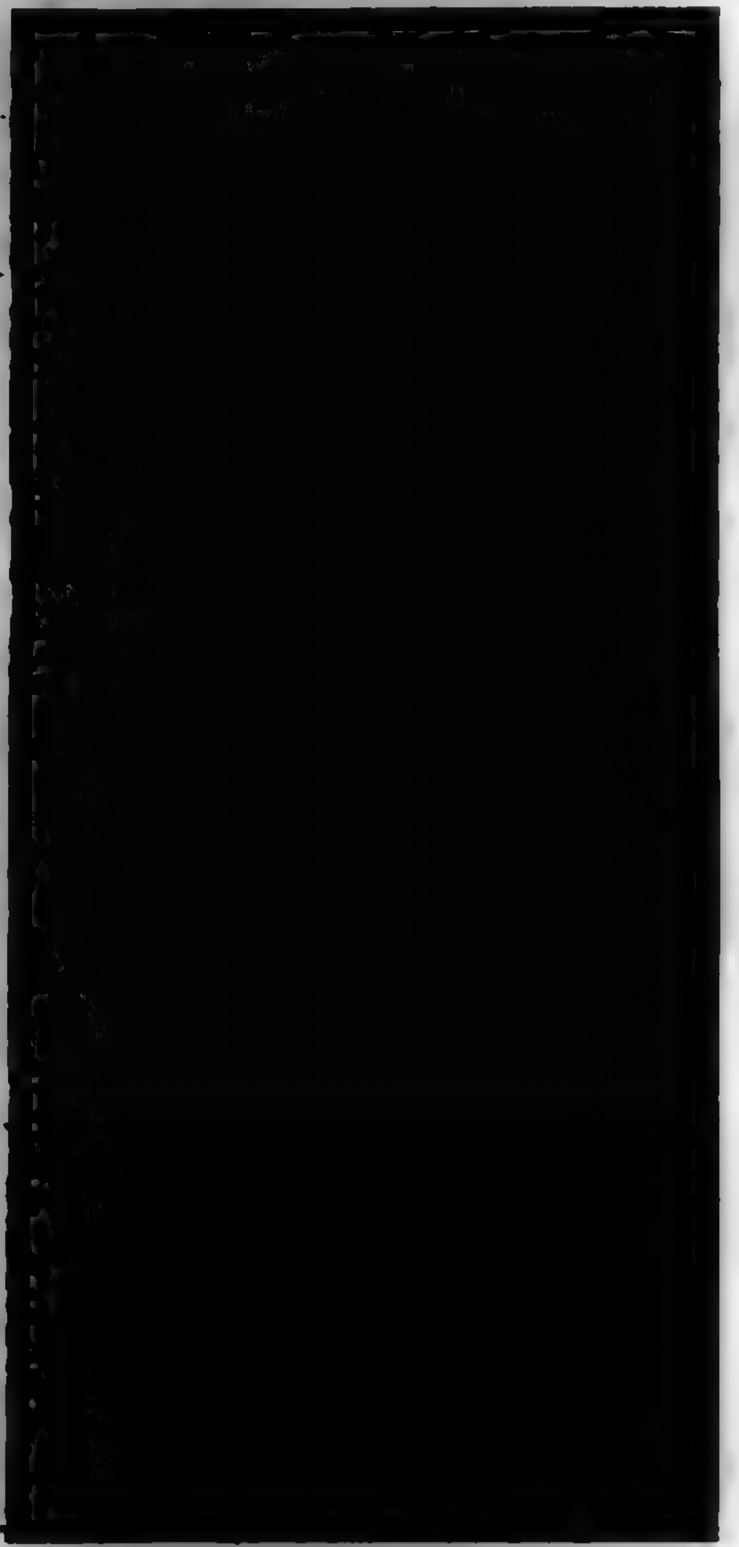
"It's likely by then that everyone will be thinking of becoming an agent to sell IBM hardware, and a shakeout is sure to follow. We plan to position ourselves early, so that we are one that stays around," he said.

IBM has already made it clear to leasing companies that it will continue to sell its own equipment at the 4381 level and above. But below that line, the vendor will be happy to allow third parties to move the boxes, Newman predicted.

"This is going to make a tremendous difference to the old-style software houses," Newman said. "As an agent, clients will be dealing directly with us for both their hardware and software. We, in turn, will be dealing with IBM.

"A software house that is not selling hardware could be left out in the cold; . . . its new market will be subcontracting to the agents," he said.

Lawrence is the news editor of Computer News, *the British sister publication of* Computerworld.



SECURITY, NATURE'S WAY.

Our Security System Does Something Nature Doesn't Do. It Protects The Data In MVS, VS1 And VM Environments.

Only one security software is the accepted standard for OS/VS environments: *ACF2, Access Control Facility.*

Over 1200 organizations, including many Fortune 500 companies, trust ACF2 for access control because it gives peace-of-mind against unauthorized disclosure, modification, or destruction of data.

With ACF2, all data is protected automatically — by default. Authorization access is granted based on a need to know. This avoids confusion, assignment mistakes, and oversights.

Installation is fast. Implementation is painless. Critical data sets can be protected first, while less critical data can be secured in stages to avoid disruption of daily work routines.

All system resource accesses are monitored and controlled as they occur. A complete audit trail provides total accountability.

Surprisingly, all this control uses a minimum of administrative and machine overhead.

See how naturally ACF2 can blend into your environment. Call or write to arrange a personal presentation.

The Cambridge Systems Group

24275 Elise, Los Altos Hills, CA 94022, U.S.A.,
(415) 941-4558 • Telex 357437

ACF2...the only software security system rated Class C-2– the highest rating awarded by DoDCSC.

INTERNATIONAL REPORT
CW International News Network

AUSTRALIA

SYDNEY — Torrential rains caused severe flooding in three of four exhibition halls used for the recent Australian Computer Conference '84 here, and power was lost in the main hall, it was learned. The electrical switchboard in the Royal Hall of Industries was reportedly submerged under almost 3 meters of water and will have to be replaced at a cost of approximately $100,000. Carpeting and computer equipment throughout the hall were also damaged by the flood, and the hall remained open without power on Friday, the last day of the show. Vendors were unable to demonstrate systems or software to the sparce crowds, and show sponsors Riddell Exhibition Promotions waived the entry fee because of the inclement conditions.

■

BOX HILL — In a dramatic turnaround from previous years, Data General Australia Pty. Ltd. posted a 73% jump in revenues and a "substantial" but undisclosed profit, according to sources. The result mirrors DG's worldwide results, which showed a 40% increase in revenue in its fiscal year ended Sept. 30.

■

ADELAIDE — An order for 224 NEC Corp. APC 111 computers was recently placed by the South Australian Department of Technical and Further Education (SA Tafe). According to SA Tafe official Jeff Porter, "IBM was not in the running in terms of price." Apple Computer, Inc.'s Macintosh was likewise ruled out because of high costs, Porter said.

■

PERTH — The Australian Wool Testing Authority has ordered almost $2 million worth of computer equipment from Burroughs Corp. The authority previously used six Burroughs' B1800s, which reportedly offered no suitable upgrade path and needed to be replaced. The order calls for three Burroughs A9 mainframes, 30 of the vendor's B25 workstations and Linc 4GL software. The authority will use the equipment to tabulate its 500 annual tests conducted each spring for wool buyers.

■

MELBOURNE — Australian computer maker Labtam Pty. Ltd. has signed a contract valued at over $1 million with the Chinese government to supply 50 of its Model 3003 Z80A-based systems, along with the components needed for the Chinese to manufacture an additional 250 systems. The computers reportedly will be used to automate government factories.

■

TASMANIA — A point-of-sale system based on the IBM Personal Computer is newly under production here. Sources said IBM Germany backed the undertaking, and the state government here has provided a $500,000 grant for the project. IBM reportedly will demonstrate the newly developed PC Cashier at the 1985 Hannover Fair in West Germany this spring.

FRANCE

PARIS — European manufacturers CII-Honeywell Bull, Siemens AG, Nixdorf Computer AG, ICL Co. and Olivetti Corp. will form an association to promote a common version of the Unix operating system in Europe. This announcement came in the wake of the formation of a joint R&D center by ICL, Bull and Siemens and follows a written agreement by 12 European computer makers to utilize the same Open Systems Interconnect standard. It is thought that the European manufacturers' move is intended to counter IBM's and AT&T's strong presence in the European market. They have projected that the number of corporate Unix users here will jump from 2,000 this year to 8,000 next year and wish to secure themselves a place in this market, sources said.

Olivetti's close affiliation with AT&T did not hamper its desire to belong to the the European pact. Insiders find it curious, however, that the Italian manufacturer, which sells the AT&T 3B series here, has joined with European high-tech companies. It is thought that Olivetti has an acute conflict of interest: Its financial and technical allegiance to AT&T seems in direct opposition to its cultural and geographic kinship with other European computer companies.

JAPAN

TOKYO — Hitachi Ltd. has developed the HT-5683 Kanji-character line printer. The $540/mo machine is said to be capable of speeds of 200 line/min, and can reproduce graphics, figures and pictures, as well as data. The impact printer can be used with the vendor's L-450/470 midrange mainframe and also with the Hitachi T-560/20 data system and M-220 processor family. The printer will be available in March.

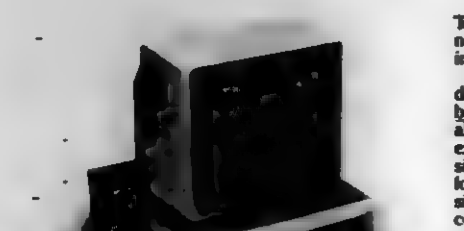
WEST GERMANY

BERLIN — The IBM Personal Computer, Personal Computer XT and Personal Computer AT will act as multifunction end-user products capable of videotex, it was learned at the IBM-Videotex Congress, held here recently. This capability reportedly was made possible by an IBM adapter card that supports the Postal Telephone and Telegraph Administration decoder.

When a big story breaks, you'll hear about it faster thanks to the new UPI Computer System, which utilizes the Zenith Z-150 PC as its central hardware component. UPI chose the Zenith Z-150 only after testing and even "roughing up" dozens of leading microcomputers, because it delivers the total performance that helps radio and TV stations report the news as quickly and accurately as possible.

ZENITH COMPUTERS MAKE NEWS WITH UPI!

WHEN TOTAL PERFORMANCE IS THE ONLY OPTION.
The IBM PC-Compatible Zenith Z-100 PC's.



Desktop Z-150 PC

Total performance. It's a must for United Press International, in reporting news that changes the face of the world. And for you, in handling information that changes the face of your business.

Whatever the challenge, the IBM PC-compatible Zenith Z-100 PC's deliver total performance, with enhanced features that take you beyond IBM compatibility. Including internal expandability that allows you to add peripherals without adding size. Storage that can expand up to 11 megabytes with a hard disk—all within the same single desktop unit. The ability to run virtually all software designed for the IBM PC with speed, power and precision. A detached keyboard similar to an IBM PC, but with a "smarter" key layout for greater convenience. And much more.

Each Z-100 PC comes with "total performance" extras no other desktop computer gives you! Like the Zenith 65-year reputation for quality and rock-solid reliability. And the Zenith support system that provides on-site service within 24 hours of your call.

When total performance is the only option for you, call 1-800-842-9000, ext. 1, for your free Z-100 PC information kit and the name of your nearest Zenith Data Systems dealer.

Zenith data systems
THE QUALITY GOES IN BEFORE THE NAME GOES ON.

Q: How Many People Are Afraid Of Your 4-GL/DBMS?

A: None, If You Have EZNOMAD.

That's right. EZNOMAD is a major extension of NOMAD2 that pulls novice and infrequent end-users into the mainstream of mainframe computing. EZNOMAD's screen-driven environment requires no key words, system commands, or knowledge of syntax for operation.

With EZNOMAD, your end-users can sit back and follow a series of English-language instructions, menus, and pick-and-point screens. Now, those busy "management types" who "never have the time" to learn mainframe computing don't need to take the time. Infrequent users no longer need to "relearn" the system every couple of months.

EZNOMAD's micro-like capabilities access essentially all of the functions and power of NOMAD2. Imagine a senior manager in your company developing databases, creating applications, maintaining databases, and writing ad hoc reports — without your help.

Your senior management will not only be pleased with the capabilities of EZNOMAD, they will also be delighted with the cost of EZNOMAD—its's free to all NOMAD2 licensees.

In other words, you get the ease-of-use of a micro and the tremendous power and flexibility only a mainframe can deliver. And the price is right.

It's nice to know that when you pick NOMAD2 as the 4-GL/DBMS for your company, EVERYBODY will know first-hand that you've made the right choice.

EZNOMAD is the latest innovation in end-user computing from Dun & Bradstreet. NOMAD, now NOMAD2, has evolved over the years to keep pace with the demands for providing business professionals with maximum computing power. EZNOMAD is a major stride in that direction.

NOMAD2:

An Innovation In End-User Computing From Dun & Bradstreet

DunsPlus: The Micro Solution That Reflects The Way You Do Business

You've heard the buzzwords: user friendly, integrated, smarter, faster, cheaper. But when you push the rhetoric aside you're still asking the same question, "Why can't I get a system that solves more problems than it creates?"

You can. It's called DunsPlus and it's built to respond to your information-related business demands without creating demands of its own.

DunsPlus gives the IBM PC XT a built-in business environment. This lets you mold DunsPlus to fit the way you do business.

Within the DunsPlus environment is a software base of the best. Lotus, MultiMate, Western Union electronic mail (to name but a few), are all ready for immediate use. But additional programs to solve your unique problems can also be added with ease.

Instant, yet controlled, access to your choice of mainframes and subscription databases is also a part of the DunsPlus environment. And transferring data throughout the system is as easy as moving a piece of paper from the In Box to the Out Box.

Immediate end-user productivity is not an issue: DunsPlus is a menu-driven system requiring minimal keystrokes for maximum results.

Installation is not an issue: DunsPlus is installed by IBM.

End-user training is not an issue: Training and support are part and parcel of DunsPlus.

Flexibility is not an issue: Any part of the DunsPlus solution--hardware, software, or service--can be tailored to meet your precise business needs.

In fact, there are no issues. DunsPlus does what you want, the way you want it--now.

Designing systems that reflect the way you do business is business as usual for us. NOMAD2, the premier 4th-Generation-Language/DBMS from D&B Computing Services, has made us a leader in the field of information management services. And as your needs evolve, so do we. DunsPlus is just the latest step in translating technological advances into usable business tools --tools that reflect the way you do business.

Network to save institute $100,000 annually

BEAUMONT, Texas — A state organization expects to save $100,000 a year with the help of an office automation system, although only 24 employees use the system's 16 personal computers and minicomputers.

The John Gray Institute, chartered in 1981 and located on the Lamar University campus here, is a privately funded, state-operated organization whose primary responsibilities are to improve relations between labor and management, study ways to increase productivity and provide educational programs and training. Its aim is to improve economic opportunities in the Gulf Coast area.

The institute last year spent $250,000 to install Xerox Corp. office automation equipment, linked on an Ethernet local-area network, to create, manipulate and transfer text, graphics and statistics. The institute expects the network to pay for itself within two more years.

"What this technology has done is give us more time to perform the tasks the institute is chartered to perform," said Steven Lawrence, assistant director for administration at the institute. "Without these information processing tools to help us, our present staff couldn't do all of the work. We'd have to hire at least three more secretaries, our research staff would have to be expanded, we'd need another bookkeeper and we'd have to pay commercial rates for a lot of the work our equipment enables us to do right here."

'We learned that most computer companies train their people to sell to management, not to users.'

— Steven Lawrence, assistant director for administration

The Xerox 8000 network system at the institute includes two Xerox 8010 Star information processing systems. Tied to those systems through Ethernet are six Xerox 820-II personal computers and three Xerox 16/8 small-business computers used for document creation, a Xerox 8037 80M-byte file server and five Xerox 860 information-processing systems used for document revisions.

The communications capabilities that let the varied computers transfer work among themselves were the key factor in choosing the Xerox system, according to Lawrence.

But ergonomics was another important element in the process.

"We made a conscious effort to think first of the people who would work here. We knew that their environment would affect their productivity. We determined not only to give them the right to work, but with the right setting," Lawrence said.

During the selection process, the institute sent three secretaries with a needs list to three vendors.

"We told those companies we wanted our secretaries to turn on the machines, load the software, learn whatever they needed to perform the tasks they defined, then report their findings," Lawrence said. "It was a frustrating experience, both for our secretaries and for each company's sales representatives. They just weren't geared to sell their products this way. One company even chided us for allowing our secretaries to have a say in what it considered to be strictly a management decision.

"We learned that most computer companies train their people to sell to management, not to actual users. Aside from being able to show a few standard demonstrations designed to dazzle executives, many sales people don't really know how to use the machines they sell."

He added that Xerox best met the institute's needs. The system replaced stand-alone CPT Corp. word processors that the institute used on a temporary basis for just over a year.

Lawrence said the greatest cost savings came in the initial keyboarding and revision of research papers, newsletters and brochures. "We do a lot of original manuscript typing in the course of our research here, and since it's virtually impossible to dictate this kind of material, the equipment helps the authors simply by being so easy to use," he said.

Researchers do the initial manuscript typing on the 820-IIs and 16/8s and transmit to the 860s for secretarial revision. The smaller computers also are used for data analysis and data base management. The 8010 workstations produce graphics and incorporate graphics into text for final output.

Printing is handled by a 12 page/min Xerox 8046 laser printer.

Lawrence noted that as a new organization, the institute had an advantage in automating the office. He said of the two-year-old project, "Some people struggle with the idea of when and how to automate their offices, but we had automation in mind right from the beginning."

YOUR SOFTWARE IDEAS ARE WORTH MILLIONS

Most of today's outstanding software is the inspired idea of one individual

YOU can be one of these **individuals!** Your software ideas can bring you recognition, fame, independence, wealth and **ROYALTIES FOR LIFE.**

"We see our own rejected ideas in the works of geniuses." EMERSON

Before writing this book, I traveled this country for fifteen years, selling over $11,000,000 worth of computer software. I have talked to thousands of people in the data processing industry. Most of these people had ideas just as good, **if not better,** than the ideas behind the products I was selling.

COMPUTER SOFTWARE IS THE GREAT FINANCIAL FRONTIER OF THE NEW

Software is a cottage industry that offers the opportunity to develop your idea at home, at work after hours, in a log cabin, beach house or teepee. Even if you can't write a line of computer code, all you need is an idea, self-confidence, and this book. With **SOFTWARE: ROYALTIES FOR LIFE,** we will move your idea to a program, to a product, and finally, to the market place, where you can make millions for yourself, instead of making millions for other people.

If you are one of the following:

APPLICATIONS PROGRAMMER
SYSTEMS PROGRAMMER
SYSTEMS ANALYST
SOFTWARE DEVELOPER
OPERATIONS PERSONNEL
SOFTWARE SALESPERSON
INVESTOR AND ENTREPRENEUR
D.P. CONSULTANT
SOFTWARE COMPANY
SOFTWARE EVALUATOR
EDP AUDITOR
OR
ANYONE WHO HAS EVER SAID,

"Somebody ought to write a program that . . ."

You will find valuable information in **SOFTWARE: ROYALTIES FOR LIFE.**

Within this book, you will learn:

☐ How to generate and develop your ideas
☐ How to test your ideas
☐ How to write a program from your idea
☐ The ten characteristics of a successful program
☐ What is the difference between a program and a software product
☐ How to package your program
☐ How to name your product
☐ How to price your product
☐ How to develop sound Documentation, Cost Justifications, and Competitive Comparisons
☐ How to sell your package to a software vendor company
☐ Successful author-vendor agreements
☐ How to make appointments with the President or "Top Man" of a corporation
☐ How to make a successful sales presentation
☐ How to start your own software marketing company
☐ How to develop sound customer support
☐ How to develop prospecting procedures, product education, maintenance and enhancements
☐ How to protect your product
☐ How to hire successful sales personnel
☐ AND MUCH MORE

BUT MOST IMPORTANT, you will learn how to gain your recognition, independence, wealth and **ROYALTIES FOR LIFE.**

Having spent 25 years in data processing, working for well managed and poorly managed corporations, I have been involved in operations, been a systems analyst, ranked in the top 3 salesmen of software in the U.S. for 13 years, been a director of marketing and purchased software from authors for resale. This gives me the confidence to fully guarantee that you will find **SOFTWARE: ROYALTIES FOR LIFE** of great value, or I will gladly refund your money. **In fact, I guarantee you can't afford NOT to buy this book.**

It's your choice, of course, to either reject your ideas and see them appear in someone else's product, or to allow the company you work for to make millions from **YOUR IDEA,** while you are "too busy earning a living to make any money." **OR** you can purchase this book that will encourage and educate you, resulting in your receiving recognition and financial security for the rest of your life.

CLIP AND MAIL COUPON BELOW

INTRODUCTORY OFFER

MAIL COUPON TODAY!

Integration halves fireplace maker's DP costs

MOUNT PLEASANT, Iowa — A manufacturing company here slashed its data processing budget almost in half by converting to a new system.

Heatilator, Inc. — a division of Hon Industries that makes steel fabricated fireplaces for home installation — spent a half million dollars a year in data processing for equipment rental, maintenance, a 10-person DP staff and software development costs, said David Mayes, MIS manager at the time of the conversion. The company wanted to add a fully integrated manufacturing package to its IBM 4300 batch processing system, he said.

Heatilator hired Mayes to evaluate the current installation and make recommendations for either upgrading or changing it, he said. "I surveyed the costs of bringing in a fully integrated manufacturing system for the 4300, and it would have been $300,000 to $500,000 for the software alone," Mayes said. The company had set aside a budget of $150,000, he added.

New system cost less than an upgrade

Mayes investigated minicomputers and found that a Prime Computer, Inc. Prime Information System with a fully integrated manufacturing package met the company's needs and stayed within the budget. After waging what he called "quite a battle with corporate directors who did not believe you could put in a good, new installation for less than the cost of an update to the old one," Mayes ordered the system.

Nine months later, the system was fully implemented. The company bought a used Prime 11000 with a 160M-byte disk to start. "We went from batch to totally on-line processing, cut our spending on data processing companywide by 40% to 45%, decreased the DP staff from 10 to two people, and we're doing a lot more processing," Mayes said.

After the installation of a labor reporting system a few months down the road, response time became a problem, and Mayes upgraded to a Prime 750, he said. Since the installation, the facility has gone from 15 to 24 Applied Digital Data Systems, Inc. Viewpoint terminals and includes a Printronix, Inc. T300 system printer and six slave printers by Datasouth Computer and Mannesmann Tally Corp., totaling $260,000, he said. In the same period of time, the company's business has increased 50% in dollars and unit volume with the same number of employees, and nobody works overtime, Mayes said.

Little technical knowledge required

The software includes a full accounting system — general ledger, accounts payable, accounts receivable, order processing and payroll written by Compufact of Santa Ana, Calif., Mayes said. The old system had no manufacturing software, he said. The new one, Mayes continued, provided 90% of the capabilities that the manufacturing facility needed with Compufact's Man-Fact II manufacturing system, which includes financial, marketing, MRP II, payroll and personnel modules. All modules are fully integrated and designed so that user interfaces are the same, he added. Because the Prime system is a relational data base environment, Mayes said, it requires little technical knowledge to learn and operate. In fact, the company now has no operators on staff. "We put responsibility on the users to understand the system, train their people, provide their own documentation and initiate jobs from their terminals," he added. The DP staff now consists of a system administrator and a programmer.

The company's users led implementation plans with DP playing a support role, Mayes said. A project team, led by Plant Manager Phil Hecht, consisted of representatives of each major functional area, augmented by other users when needed. The DP staff would show how a particular module worked, the team raised questions or requested modifications, and together they would work out a solution, Mayes said. Often, they could add elements without any programming at all and, in the nine-month period, the staff made 80 hours worth of programming modifications to the system.

Part of the success of the conversion is that the environment of participation led to enthusiasm among users, Hecht said. Key users in each area of operation now make up the Business Systems team, which can request changes for DP to fulfill, and they can develop their own reports with the systems report writer, he said.

The company is waiting for installation of a procurement module for its Compufact software, Hecht said, and then the system will be complete.

MEMOREX
MRX°V
The Multi-Purpose
Computer Tape.

100% Tested • 25 Year Warranty • Least Abrasive

	Price per reel
600' w/seals	$ 8.65
1200' w/seals	$10.95

Association elects 1985 candidates

SAN FRANCISCO — The Information Industry Association, a Washington, D.C.-based national trade association, elected candidates for its 1985 directorships at the group's recent annual meeting here.

Appointed to four-year terms were: Jack Simpson, president, Mead Data Central; Marsha Carow, vice-president, Harcourt Brace Jovanovich, Inc.; James McGinty, vice-president of group government relations, The Dun & Bradstreet Corp.; and Daniel Sullivan, president, Frost & Sullivan, Inc.

Appointed to one-year terms were L. John Rankine, director of standards and data security for IBM; and Brad Henderson, director of product development, American Banker.

Robert November, managing consultant at Link Resources Corp., was elected the association's chairman, effective in January.

Come See For Yourself DunsPlus: The Micro Solution That Reflects The Way You Do Business

Don't just take our word for it. Attend one of our nationwide seminars, "Innovations in End-User Computing," and judge for yourself. We'll show you how DunsPlus responds to your business demands without creating demands of its own.

What will you see at this seminar? We'll show you how DunsPlus has given the IBM PC/XT a built-in business environment—an adaptable business environment.

You'll see how easy it is to work with this menu-driven system. How single-button fast it is to access widely accepted software, like 1-2-3 from Lotus, MultiMate and Western Union electronic mail, already incorporated into DunsPlus. How easy? No DOS, no typing skills, no frustrating documentation.

And you'll see how DunsPlus gives you full flexibility to tailor its environment to your precise business needs. Add any variety of software and customized applications. Link DunsPlus to virtually any mainframe. You will see how DunsPlus can slip smoothly into the way you and your organization do business.

If your business demands answers, not claims, look at DunsPlus.

Innovations in End-User Computing Seminars are being held each month in these locations:

**Chicago, Cincinnati,
Dallas, Houston, Hartford,
Los Angeles, New Jersey,
New York City,
San Francisco, San Jose,
Stamford, St. Louis**

For dates or more information, including locations of additional seminars, call today: **800 DNB-PLUS.**

Mainframe conversion speeds mill orders

TRENTWOOD, Wash. — Orders in an aluminum mill here that once took three days to turn around now take one day with a mainframe-based information system, according to the manager of the mill's production control and planning.

Kaiser Aluminum and Chemical Corp.'s Trentwood Works, which makes aluminum sheets, plates and coils, has an IBM 3083 tied to the company's Northwest Regional Data Center, which runs an IBM 3083 Model E mainframe. Installed in July 1983, the 3083 has three times the capacity of its predecessor, an IBM 4341, Model Group 2, said Michael Stemm, production control and planning manager. Communications between the regional center in Spokane and Trentwood are over 56K bit/sec telephone lines. Average response time to users is two seconds, with from 82% to 85% of responses between 1 and 1.5 seconds, Stemm said.

> *'We're building a framework which will make future on-line systems productive and give accurate information on a timely basis.'*
>
> — Dick Goodnight, Kaiser Aluminum and Chemical Corp.

The Spokane center was built in the summer of 1981 for data processing and plant support in the Northwest region. Kaiser management has approved funds for a second center in Columbus, Ohio, which will support up to 13 plants in the Midwest, according to Dick Goodnight, group manager for the Northwest region.

"We're building a framework which will make future on-line systems productive and give accurate information on a timely basis," Goodnight said. "In order to build a foundation, we had to set up a network of computers that would provide sufficient capacity and get us out of the DOS world and into the world of MVS."

Kaiser Aluminum went through some rough spots to implement the system. The company had to upgrade equipment, build a center, complete the 4341-to-3083 conversion and develop new applications all at once. "We hired the best people we could find," said Glen Norton, Operations Manager. "We placed people on projects who knew plant operations and we had them actively involved in establishing requirements for the system."

A number of on-line plant applications have been implemented, including order entry, shipping, inspection, maintenance, sales on-line and practice planning. A major application under development is intended to tie all plant manufacturing centers to the main plant data base via IBM Series/1s and process control computers. The system, called the Trentwood On-Line Production System, will aid the plant in keeping better control of in-process inventories, provide more timely information for customers and track an order through production stages.

The Corporate Maintenance System schedules maintenance workers, keeps track of spare parts and prints preventive maintenance schedules. The system ties directly to the Corporate Accounting System and records all dollars spent on maintaining plant equipment. The Sales On-Line System provides on-line status of customer orders. The Packaging and Shipping System oversees release dates of products, the maintenance of reliable finished goods inventory as well as the optimization of freight car and truck loading.

In addition to shipping and inspection, all orders are scheduled via the on-line Practice Planning System. Mass changes that previously took days, can now be made in minutes, the company said.

Manufacturing plants can also access data bases to determine order information at other Kaiser facilities. For instance, the status of an order booked at Trentwood but processed in West Virginia can be checked instantly from a Trentwood terminal. Previously, telephone calls were made or information mailed, sometimes resulting in delays of several days in getting an order to a plant with the capacity to run it.

"Helping plants become more productive required the network and installation of compatible equipment — from the large IBM 3083 computer down to IBM Personal Computers and Displaywriters," Goodnight said. He said the 3083 has a 99.8% uptime and is currently processing 45,000 transactions monthly.

Programmer productivity on the system is said to be enhanced by TSO and a Screen Definition Facility (SDF), a CICS programming tool. "SDF has made a major difference, probably increasing programmer productivity 30% to 40%," Goodnight said.

Finally, personal software
for big computers.
Prime INFORMATION.

No, it's not a PC. It's one of many terminals connected to a single, powerful Prime® system. What makes it personal? The revolutionary Prime INFORMATION™ software.

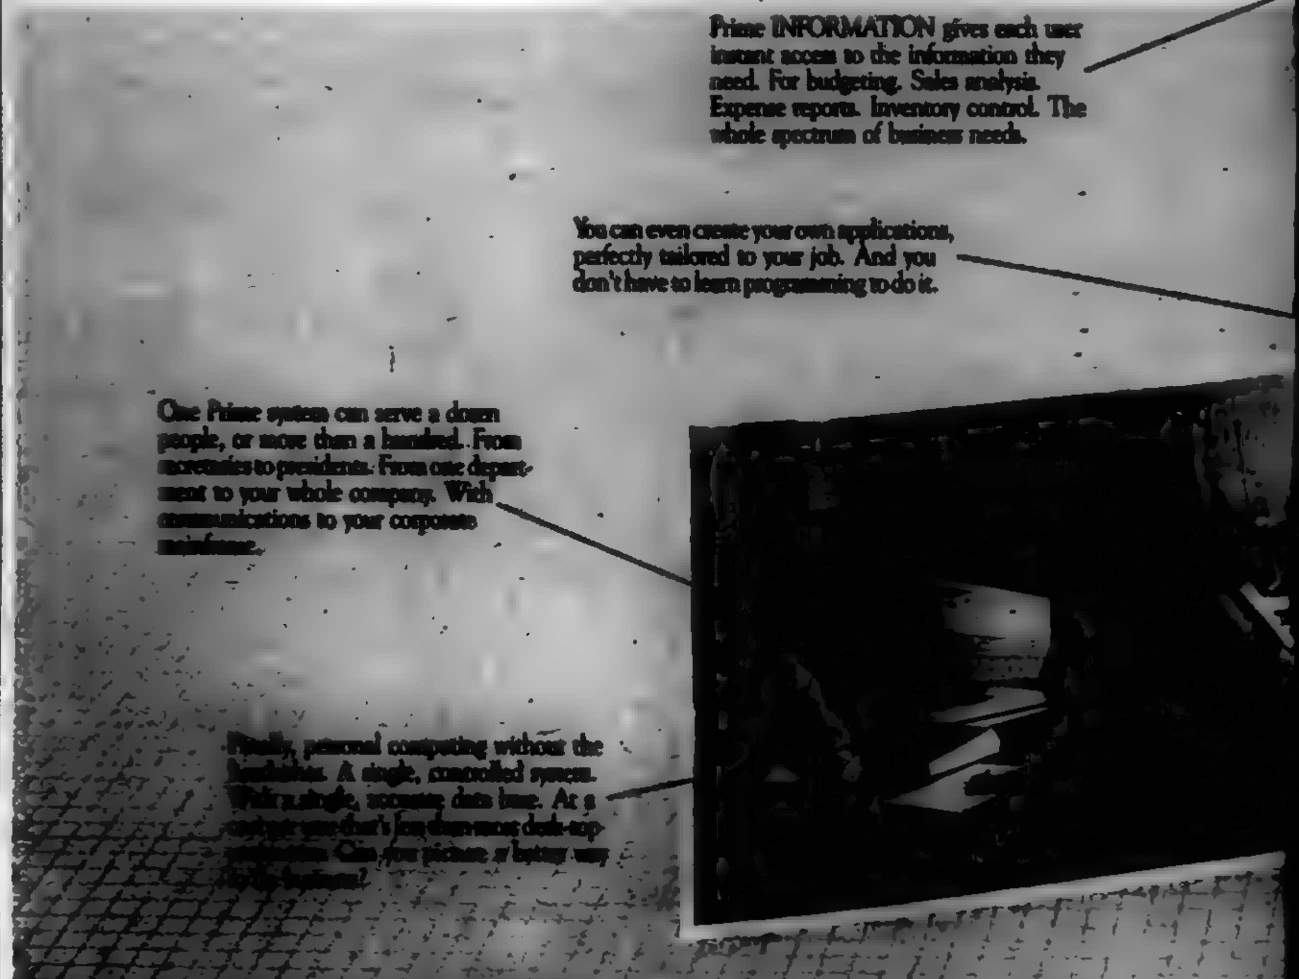
Prime INFORMATION gives each user instant access to the information they need. For budgeting. Sales analysis. Expense reports. Inventory control. The whole spectrum of business needs.

You can even create your own applications, perfectly tailored to your job. And you don't have to learn programming to do it.

One Prime system can serve a dozen people, or more than a hundred. From secretaries to presidents. From one department to your whole company. With communications to your corporate mainframe.

Finally, personal computing without the headaches. A single, controlled system. With a single, accurate data base. At a cost per user that's less than most desk-top computers. Can you picture a better way to do business?

[illegible]



Dasd system restores business' lost storage

MADISON, Wis. — Converting to an IBM MVS operating system created a disk storage space problem for the DP division of a large telephone company here. But when TDS Computing Services, Inc. (TDSCS) implemented a direct access storage device (Dasd) management product, storage was reorganized, creating more than 1,600 cylinders of Dasd space.

As a subsidiary of Telephone and Data Systems, Inc. — the ninth largest telephone company in the nation — TDSCS provides data processing services for its parent company, independent telephone companies and other businesses. Recent rapid growth of the parent company led to the decision to convert from IBM VM/DOS to MVS.

DMS/OS Dasd Management System, manufactured by Software Laboratories, Inc. of San Bernadino, Calif. and marketed by Sterling Software Marketing, Inc. of Sacramento, Calif., was installed on TDSCS' IBM 4341 Model 12 mainframe. Within two weeks, TDSCS gained back more than 1,600 cylinders of Dasd space. Today, DMS/OS is being used on the company's Amdahl Corp. 470V/8 mainframe.

Dasd needed control

"We got MVS fired up, and all of a sudden we realized we had to do something to control our Dasd," said Gary Annen, systems programmer for TDSCS. "We were bringing 3,350 volumes out of the DOS world into the MVS environment, and in one week's time that Dasd space was used. There were just no controls whatsoever. DMS/OS put that all back in perspective," he said.

"We initially ran the Idle Space Release facility and gained back roughly 200 cylinders," Annen said. "Since we were being hard pressed to find five cylinders of continuous space, we thought that was great." TDSCS then ran several other DMS/OS facilities, including Explicit Archive and PDS Compression, and gained back more than 1,400 additional cylinders.

Annen used another facility, the Volume Configurator, to move data sets from 3350s to 3380s. "It was excellent," he said. "Everything worked as documented."

Still another facility, the ISPF interface, is used regularly by several of TDSCS' applications interactive users. "We've now got DMS/OS available to all of our interactive users. They can queue requests to archive, backup and restore." Annen was also able to provide the interactive users with access to PDS reports through the ISPF interface.

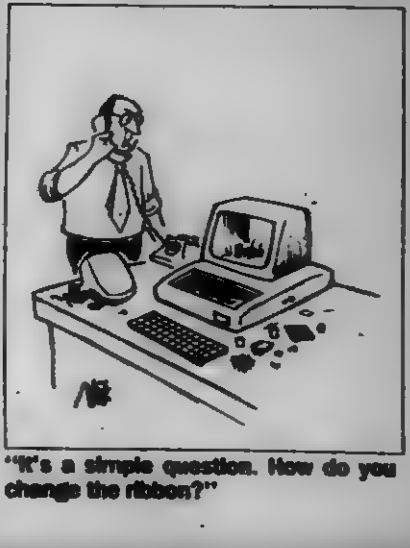
TDSCS recently used DMS/OS to perform disaster recovery, Annen said. "We lost a 3350 in a head crash, so we had to do a full volume recovery. DMS/OS was great. You come in at one o'clock in the morning, and you expect the worst. But it was relatively smooth. DMS/OS did its job just the way it was documented."

Computer law to be discussed at conference

PHOENIX — The Third Annual Advanced Computer Law Invitational conference and workshop will be held at the Pointe Resort at Squaw Peak here on Jan. 14-16, 1985. Called Computer and Communications Law, the event is sponsored by the Arizona Law and Technology Insitute and the Arizona State University College of Law.

The keynote address will be delivered by U.S. District Court Judge Harold H. Greene. The conference will concentrate on emerging legal and business issues in a post AT&T divestiture enviroment. Workshops will focus on electronic funds transfer, cellular radios and legal and business planning in cooperative ventures among computer and communications companies.

The price of the conference and workshop is $545 until Dec. 25, at which time it becomes $595. More information can be obtained from Dr. Edward A. Johnson, Center for the Study of Law, Science and Technology, Arizona State University College of Law, Tempe, Ariz. 85287.



"It's a simple question. How do you change the ribbon?"

Retrieval system codifies NBC video footage

Computer-aided system assists Network Archives department file news segments

NEW YORK — When NBC network documentary viewers see historical videotape, perhaps from the Vietnam War, a previous space shuttle voyage or a previous presidential inauguration, chances are good that a minicomputer from Ultimate Corp., in the News Archives department here, helped locate the tape.

The News Archives department uses a computer-aided retrieval system for filing every news segment shown on NBC. Beginning with the early morning *Today* show, operators review news programs, segment by segment, and then enter a technical and visual description and ID number into the system. The News Archives serves as a resource for documentary, news and other show producers.

Although the actual videotape archives and the research department are located in the NBC News headquarters in Rockefeller Center, data is input at Fort Lee Films in Fort Lee, N.J. Nine operators view each day's news programs, feature by feature, and then input certain key pieces of information using eight searchable fields — ID number, reporter, cameraman, affiliate station, place, data, personality and subject.

First automated in 1976

According to Alan Bernstein, NBC News achives data base administrator, the news archives were first automated in 1976, when the department purchased a Microdata Corp. 4000 retrieval system. Prior to 1976, all record-keeping and retrieval functions were accomplished either by storing information on microfilm or in extensive manual card files.

By 1982, the archives needed to expand beyond the 4000's limit of 16 users, so NBC acquired a system from Ultimate based on a Honeywell, Inc. DPS 6 Model 4303D minicomputer, with 256K bytes of main memory and 24 ports. The Ultimate system was chosen primarily because it ran the Pick operating system from Pick & Associates, Inc., allowing an easy conversion from the Microdata system, which also ran Pick, Bernstein said.

Since 1982, the archive has been updated to an Ultimate system with 32 ports and 512K bytes of main memory, Bernstein said.

Now has 16 terminals

The department now has 16 terminals in the New York office, nine in Fort Lee and four terminals in Washington, D.C. News bureaus in California, London and Boston can dial into the system. Other domestic bureaus such as Miami, Atlanta, Houston and Chicago are expected to have access within the next year.

Approximately 125 records per day are entered in the system, and more than 126,000 records are now on file.

Employees at the News Archives department can access data by using any of the eight search fields or by using Recall, Ultimate's inquiry and retrieval language. Recall is said to access data on an as-needed basis by using dictionary-driven commands in plain English.

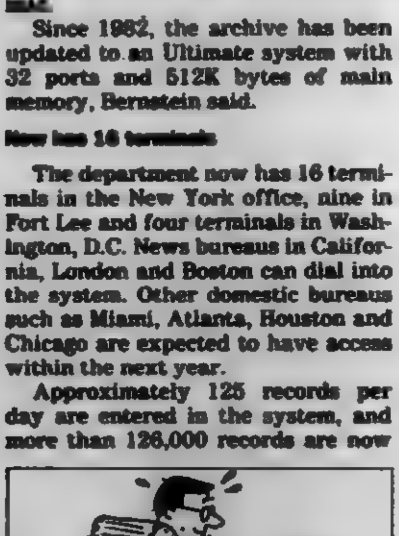
For example, if a user wishes to locate videotape coverage of the space shuttle, the user types a one-line command. The screen displays how many videotape records pertain to the space shuttle program. By asking increasingly specific questions, the user can pinpoint the exact video clip or clips desired and then display the tape's description on the screen before actually ordering the tape.

"Since we have installed the Ultimate system, we have greatly improved response time," Bernstein said. He estimated productivity has increased at least 50% since the system's installation.

One program allows the historical filing of events — which involves chronicling many NBC News film clips. The civil rights movement and political campaigns for the last 30 years have been completed, and the staff is currently logging in the Vietnam War with a total of 7,600 records, a project expected to take two years to complete.

Bernstein said he has had few problems with the system: "Downtime is negligible, and Ultimate's technical support is excellent," he said.

To improve performance further, Bernstein is acquiring an optional processor board intended to speed throughput. The time to do a videotape search should be cut from 30 seconds to 10 seconds with the option, he estimated.



Introducing connections for

With the new IBM Personal Computer AT/370, you can work with hundreds of VM programs and with mainframe data right at your desk. And only IBM offers a personal computer with VM capabilities.

Now that's a Smart Desk with very powerful connections.

The PC AT/370 lets you interact with your host computer, or operate stand-alone with the power of 64-bit System/370 architecture. It also gives you the ability to address up to eight megabytes of virtual memory.

There is faster response time because you don't have to wait for the host. And there is greater data privacy because programmers only have access to the host data they need.

You also get 20 or 40 megabytes of storage plus the capability of running thousands of existing IBM PC programs. This makes the PC AT/370 not only a powerful connection but also a very versatile one.

One further point: If you already have a PC AT or XT, it can easily be upgraded to a PC AT/370 or XT/370 respectively. Ask your IBM marketing representative for the details.

And if you want to receive literature on how the PC AT/370 can turn your desk into a Smart Desk, call 1 800 IBM-2468, Ext. 90, or send in this coupon.

IBM 12-3
DRM, Dept. 3R/90

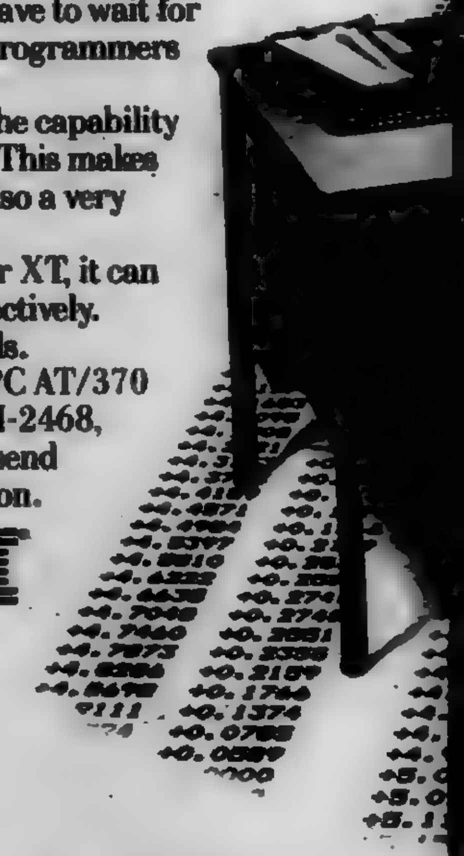
The Smart Desk from IBM



Temple project to connect five campuses

PHILADELPHIA — A seven-year, $45 million communications installation project here will eventually allow Temple University students to access university library data bases from within their dormitory rooms and ease employee work loads with automated student registration and record keeping.

According to John Patterson, Temple's director of communications, the first phase of the $45 million project began in August, with the $12 million installation of a microwave system link throughout the university's five area campuses, the installation of two Intecom, Inc. Integrated Business Exchange (IBX) S/80 switches and new wiring between the school's 105 buildings spread over five campuses.

"This creates the backbone for subsequent development," Patterson said, particularly the school's eventual goal of creating a universal workstation, whereby microcomputers and minicomputers throughout the university can communicate with remote data bases.

Reduce phone costs

Saving money on telephone costs was the driving factor behind the communications project, Patterson said. A university feasibility study suggested that the school could save about $6 million over a 10-year period if it switched from a Centrex system to a private line.

Telephone costs now exceed $3 million a year, including equipment costs, utilities and line charges for 10,000 academic and administrative telephone lines, he said. "After we received the bids, we believed we could save $9 million over 10 years," Patterson said.

"We wanted to created a framework of transport architecture, with a digital switching matrix that would support a wide-range of video and audio products," Patterson noted.

With a plan in place, it took 10 months for the university to write the funding proposal, get it passed and evaluate vendors, Patterson said. The school received seven proposals.

In its selection process, Patterson and school officials examined each system's price; its transport architecture; the quality and technical characteristics of the switch vehicles; data switching architecture, including switches and price performance; and the ability of the vendor to sell, install and maintain the system. According to Patterson, two finalists were Bell Atlanticom Systems, Inc. and Northern Telecom, Inc.

"We spent three months negotiating a price with each vendor," Patterson said. The final decision was based on the price/performance evaluation." Temple selected Bell Alanticom's voice, data and video system based on Intecom's IBX S/80 voice/data switching equipment.

According to the vendor, each IBX is a nonblocking packet-switched system based on a star topology and contains 8192 voice and data ports. Asynchronous transmissions, at speeds ranging from 50 bit/sec to 19.2K bit/sec, are said to be accomplished by connecting the RS-232C port on a personal computer, for example, to an Integrated Terminal Equipment (ITE)-type telephone. The ITE can be connected to an IBX voice/data port over standard two-pair telephone wire. In synchronous transmissions, a concentrator is linked to a voice/data port and transmission speeds run from 1,200 bit/sec to 57.6K bit/sec, the vendor said. Local-area network functions are handled at up to 10M bit/sec in burst-mode packet switching.

When installed, the system will connect telephones and computers in virtually every room at the main urban campus, the nearby Health Sciences and Medical School, the Temple University Center City campus and two other campuses in the Philadelphia suburbs.

Students link via phone jacks

The Temple system is connected by about nine miles of fiber optics and eight microwave transceiver stations that will link the 104 buildings of the school's five campuses. In the library, the communications system will have the capacity to link about 1,000 faculty microcomputers, up to 750 microcomputers for students (located in 25 microcomputer laboratories), 195 minicomputers, 110 standalone word processors, as well as three mainframe computers with up to 625 terminals. Students with personal computers can now link into the system via the phone jack in their dormitory rooms. Systems currently being used in the university include IBM 3081, 4341 and 4331 mainframes, a Control Data Corp. Cyber 750 and about six Digital Equipment Corp. VAX-11s.

Cable installation throughout the university is on schedule and just about complete, Patterson said. By December of next year, all campus dormitory rooms will be furnished with voice and data capabilities.

Patterson is pleased with the progress to date, particularly with how quickly the university was able to get the project under way. "All the planets just lined up at the right moment," he said.

THE ITT 9236.
IT HAS THE FUNCTIONS YOU WANT TODAY, THE FLEXIBILITY YOU'LL NEED TOMORROW.

When it comes to extended functions, our new 9236 display has everything.

For instance, it gives you dual logical units that let you change applications with a single keystroke.

It has selectable screen formats so you can use one display to handle more than one application.

It can use a light pen or operate a display-attached printer so you can make local copies at your workstation.

It offers the ergonomic benefits of a non-glare matte finish. A compact, low-profile keyboard. And a flicker-free, high-resolution, 14-inch screen that tilts and swivels.

On top of all this, our 9236 gives you extended data stream and programmed symbols for color graphics. Plus a long list of exclusive ITT productivity features, like automated keystrokes, built-in notepad, dynamic color assignment, and auto log off/power off.

But perhaps the most important thing we've built into our 9236 is a flexible, open architecture. The kind of architecture that'll take you into networking, the electronic office, or wherever else you want to grow.

Of course it wasn't easy designing in all this and keeping the 9236's price competitive, too.

But, then again, giving you more display for your money has always been what ITT Courier is all about.

For more information, contact your nearest ITT Courier Representative. Or call the ITT Courier Sales Support Dept. at 1-800-528-1400, toll-free.

Texas-based inns accurately lodge more guests

SAN ANTONIO — As a timesaver and marketing tool, a string of minicomputers is helping a Texas-based motor inn chain grow by 25% a year.

With $125 million in sales in 1983, La Quinta Motor Inns, Inc. is one of the fastest-growing lodging chains in the U.S. Inns have been opening at a rate of more than 15 each year.

La Quinta, with more than 150 locations from Florida to California, caters to value-conscious travelers and focuses on providing rooms and amenities at a price 20% to 40% lower than competing motor inns and motels. Managers use Texas Instruments, Inc. minis at each La Quinta inn to track the dozens of details that accompany each reservation.

Jerry Wiggins, La Quinta vice-president of operations for systems and planning, said La Quinta started to consider computerizing individual inns in the late 1970s. Applications would encompass all front desk functions such as reservations, check in, checkout and guest billing.

La Quinto reviewed existing software packages and found none to be satisfactory. "All the packages on the market had been written for large resort properties, and extensive reprogramming would have been required to fit our operation. So we then looked at hardware vendors, with the aim of writing the programs ourselves or with the help of a vendor," Wiggins said.

Hardware requirements, according to Wiggins, included a proven operating system, flexibility in configuring the system and expandability. "We also needed a manufacturer that could provide maintenance at all our locations as we continued to open inns in new cities," he said. La Quinta decided upon TI's DS 990 minicomputers. TI also provided programming services, coding the software to fit La Quinta's specifications.

Test system set up

La Quinta set up a test system, consisting of a TI 990 Model 4 with two TI 911 terminals, at a San Antonio inn in December 1978 and eventually expanded it to all the company's inns.

Although the hardware changed as La Quinta computerized its inns, the company has continued to run the same software without any changes other than application enhancements. La Quinta now uses TI 990 Model 5s in 28 inns and, in the remainder of its nonfranchise inns, TI's Business System 671A with 512K bytes of random-access memory and 18M bytes of hard disk storage. Each system has three TI Model 931 terminals and three Model 850 dot matrix printers.

La Quinta-Highland Mall Manager Jean Klingel said the TI system was installed at the Austin, Texas, inn several years ago and added, "We went to a much more livable situation. I now have more time to spend with our guests. The computer changed my life."

More than 90% occupancy

Klingel said her 122-room inn maintains an occupancy rate of more than 90% and recently recorded 97% occupancy for one month. "Maintaining reservations on our old manual system was very difficult for a property that moves this fast," she said.

With the TI system, she noted, she always knows what type of rooms are clean and available; if someone calls for a reservation, the desk clerk can give an immediate answer. If reservations are made through a travel agent, the system automatically figures the agent's commission. When a reservation is made, the clerk enters the name, address and method of payment. "Then when the guest checks in, that reservation information becomes a preprinted registration slip for the guest to review," Klingel said. The system tracks miscellaneous guest expenses, such as long-distance telephone calls, and adjusts the bill.

Night audit, or the complete accounting for each day's business, is easier with the system, she added, noting, "What used to be an eight-hour job now takes only two to three hours. For example, it previously took an hour and a half to post room and tax on the manual system. Now it takes less than two minutes. The night auditor has time for additional job responsibilities."

Each inn's information is transmitted daily to a Sperry Corp. 1100/70 mainframe at La Quinta's headquarters here via a dial-up polling network. The company analyzes the data for financial and marketing information, such as where guests live and what type of rooms were reserved.

Wiggins said the TI systems have fulfilled their main objective — relieving the managers' paperwork burden so the managers can devote more time to taking care of guests.

"Our accuracy in knowing room availability is much better," Wiggins said. "Previously, a manager might not realize he had rooms available when someone called for a reservation, simply because manual tracking methods were inaccurate. Those days are gone. The potential to sell more rooms is greater because of accurate information."

BLUELYNX™ PACKS A MAINFRAME IN YOUR PC

Need access to an IBM mainframe?*
BLUELYNX puts that power at your PC!

3 reasons you'll want BLUELYNX to solve **every** IBM PC/Mainframe communications problem:

1. **Technical Leader.** BLUELYNX leads the field with products for PCs and ATs in IBM terminal environments.
2. **Ease of Use.** For example, our 3270 line of products includes the BLUELYNX 3270 Keyboard (see illustration) so terminal users are at peak productivity from day one. No retraining required.
3. **Superior Support.** A BLUELYNX tradition!

IMPORTANT:
BLUELYNX is the **only** complete family of products offering COOPERATIVE PROCESSING to get the most from your DP resources. One BLUELYNX 3270 Gateway, for example, lets 32 PC's talk to your mainframe.

Call Techland for solutions to your PC/Mainframe problems.

Orchestra tuned to computer convenience

SAN FRANCISCO — The instrument that Dave Murdoch performs on at the symphony," Murdoch said, "where they do the most good."

Murdoch is the San Francisco Symphony Orchestra's computer systems manager. "We're using computers in the business and artistic administration side of the symphony," Murdoch said, "where they do the most good."

Other symphonies utilize computers, but probably none to the extent of San Francisco's, Murdoch said. "Ours has the capability to process the season ticket system, box office system, donor system, financial/accounting systems, artistic administration systems and the word processing system — and all the parts are integrated with each other," Murdoch added. The symphony uses a Hewlett-Packard Co. HP 3000 Model 58 running under HP's MPE/5 operating system.

The symphony — a nonprofit venture that relies heavily on individual and corporate donations — generates only 60% to 65% of its revenue through ticket sales, Murdoch said. A 125,000-name mailing list is kept on the data base, and HP's Word III word processing package is used to develop and send solicitation letters and other correspondence. The data base also holds historical information on donor activity, which is vital to fund-raising efforts, he said.

Season ticket sales — with a complex web of telephone orders, renewals, seating upgrades, paperwork, seating charts, ticket distribution and credit card authorization — has evolved from nightmare to dream status at the symphony, Murdoch said.

"We now maintain sales history information going back several years, which can be accessed instantly with one keystroke," Murdoch said. In the past, such information was kept on paper in file cabinets. Even the tickets — whether season or single — are printed out on command.

A graphics feature — part of Micro Consulting, Inc.'s Pact/3000 ticket services system — illustrates seating charts on a terminal so ticket sellers can see immediately what is available for each performance, Murdoch said.

Paperwork reduced

In May of this year, the symphony's computer was linked directly to the Wells Fargo Bank's computer, Murdoch said. This permits automatic credit card authorization and same-day deposit capture of funds, while virtually eliminating paperwork associated with credit card processing, he added. Because the bank's paperwork has also been reduced, it has reduced service charges to the symphony, he said.

The first major computer applications at the Symphony began in 1982 with donor mailing lists and with the marketing and financial departments, Murdoch said. A customized budget system — in conjunction with Lotus Development Corp.'s 1-2-3 package on an IBM Personal Computer — was linked to the HP3000. Data was fed into the budget system, which produced spreadsheets and reports to compare actual expenses with budget figures, he said.

HP's GA3000 general accounting system, including a general ledger and accounts payable subsystem, also was brought on line, Murdoch said. The budget system was integrated with the general ledger system, giving the symphony fast and accurate budget control, he said.

The symphony is in the process of converting to HP's FA3000 accounting system, which includes modules for general ledger, accounts payable, accounts receivable and fixed assets, Murdoch said.

The Pact/3000 ticket service program began in late 1983, after Murdoch was hired to make recommendations to the board of directors, he said. "We are heavily committed to computerization now and plan to have the most sophisticated automated system in the arts when we're finished," he added.

On the artistic administration side, performance repertories — scores and arrangements making up a concert — are also filed in the system, along with program notes and public relations releases, Murdoch said. He is planning to bring the symphony's operational aspects on-line next year, with modules to track orchestra personnel data, including guest artists and conductors, musician audition history and a six module music library package, he said.

A visiting artist or conductor will, for example, be able to call up the music used in a previous appearance, add music from the library file, determine how staging would be affected by the changes and find an audio tape of the earlier performance — all in a matter of seconds, Murdoch claimed.

The HP computer's word processing system — Word III — has been expanded in the marketing, publications and public relations areas. Murdoch is slashing project processing time in half in the marketing area, he said, where season brochures — all quite similar — go through about 12 revisions a year. Press releases and media mailing lists can also be easily edited and updated.

Personnel measuring guide out

WOBURN, Mass. — Information on measuring and reporting on the performance of DP personnel can be found in a recently released report published by The Winchester Group, a consulting firm located here.

According to the publisher, the report, titled "Human Resource Performance Management — A Guide to Productivity Improvement," was written by Kenneth Rau, author of "A Guide to EDP Performance Management." The report outlines a plan for viewing personnel performance, productivity techniques practiced at eight organizations and forms for use in measuring and improving MIS performance.

"Human Resource Performance Management — A Guide to Productivity Improvement" is priced at $39.95. The Winchester Group can be reached at Suite 300, 12 Alfred St., Woburn, Mass. 01801.

Firm's program language cuts time on reports

MINNEAPOLIS — Since choosing a fourth-generation language for its corporate information center and for the information center's end users to use in writing their own applications, Graco, Inc. here has found its users producing applications that, in one department, saved five hours per week in report preparation and, in another department, improved filing accuracy of plant orders by nearly 30%.

The fourth-generation language used by Graco's information center, Nomad2 from D&B Computing Services Co., is provided for applications development work to about 130 of the firm's total of 1,500 employees via 75 terminals linked to the firm's information center. John Green, information center senior analyst, said the users are "a very large cross section of the company" — mostly junior managers and administrators. Green said the users liked Nomad2's ease-of-use and the fact that "you don't have to specify things, you specify the result that you want."

Graco is a $120 million company specializing in fluid-handling technology. Its product line of more than 700 items and custom-designed systems includes pumps and dispensing systems, robotic painting devices, fluid-handling systems for paint production lines, painting devices for architectural structures, chemical bonding devices and lubricating equipment for motor vehicles.

Inaugural training

An IBM 3083 handles the information center's needs and is used for the company's traditional on-line CICS, applications development, batch processing of production data and other uses. The information center came on-line in early January 1983 and, in that month, the first group of 11 Nomad2 end users began their three days of training. By the end of the period, which included classroom discussion, hands-on terminal practice and on-line tutoring, the students were preparing simple applications for use in their individual jobs, according to Green.

Three end users from marketing showed other department members how to access and use the applications they had built soon after the training session. In a matter of days, members of marketing were utilizing the information center service. Today, marketing still has the highest concentration of end users and requires three terminals to meet the demand.

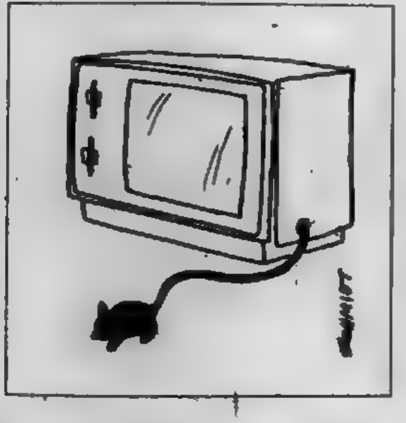
"It didn't really surprise me that the marketing people took so well to the information center. From the beginning, they were very active in the steering committee. They also have a rather large data base to work with," said Steve Kuhlmey, an information center analyst.

"If the reaction of the marketing people is any indication," Kuhlmey added, "we won't have to worry about selling others on the capability until 1985. As it stands now, we can train 10 to 12 users a month. And right now, we're all booked up until 1985. The information center really is selling itself."

The selection process for a fourth-generation language for the information center began with a choice from several contenders. Kuhlmey recommended to a steering committee of executives from such areas as accounting, manufacturing, distribution, plant and information systems that Nomad2 be purchased. The software was evaluated on the basis of its ease of access to corporate data files, flexibility in data base design and data structure, the quality of the training programs the vendors supplied for both the end user and DP professional, security features and other criteria.

Nomad2 was approved. Since its acceptance, many applications have been written with assistance from Kuhlmey and Green. Graco's traditional product pricing program has been converted to the Nomad2 information center. The procedure is now reportedly completed in half the time previously required. A more detailed customer call program has also been prepared. This data base provides marketing with extensive information on customers, their locations, key contacts and the types of Graco products each purchases.

Projects currently under way include a data dictionary to support the DP staff's systems analysis efforts and to reduce analyst and clerical time spent in updating previously developed documentation. They are also working on a sales forecast simulation for end-user applications.



Seeing is believing.

Introducing VU-TEK.
No other glare screen does more to increase productivity.

A glaring problem VDT operators face.

More than 90% of all employees who regularly use VDT's may suffer from eyestrain.* And that can make your business suffer, too.

The cause of eyestrain? Glare. Reflection from office lights. And hard to read characters.

The result. Impaired vision. Headaches. Fatigue. More work breaks and absenteeism.

And reduced office productivity.

VU-TEK™ reduces glare up to 99%.

VU-TEK contrast enhancement filters help increase operator productivity by eliminating up to 99% of reflected VDT glare while also improving character clarity. VDT operators can now work more efficiently and comfortably.

VU-TEK's dramatic effectiveness is due to an advanced circular polarizer that traps glare preventing it from reaching the VDT operator's eyes.

No other glare screen is more effective than VU-TEK.

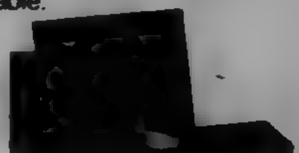
VU-TEK increases character legibility.

VU-TEK uses a special distortion-free anti-reflective coating on the front glass surface to improve character contrast and clarity.

The result... bright, clear, easy to read VDT's.

Fits leading VDT's. Easy to install.

VU-TEK fits more than 800 different VDT types. Custom sizes are also available.



VU-TEK is lightweight, durable and attaches in seconds.

"See for yourself" free trial.

End the glaring problem with computer automation — with VU-TEK.

To order your VU-TEK or arrange a 30 day free trial, call collect 1-805-987-5026. Or mail the attached coupon for more information.

VU-TEK is the result of research by American Hoechst, a member of the Hoechst Group of companies, with worldwide sales of $14.5 billion, and annual research expenditures of over $630 million.

*National Institute For Occupational Safety and Health Study, August 1981.

Manual system no longer hampers company

LAWRENCE, Mass. — A 120-year-old manufacturer of specialty pumps here decided to switch to an information management software program after concluding that its manual record-keeping system was bogging down its operations and impeding growth.

Lawrence Pumps, Inc., a privately held company with a worldwide business and 150 employees, found that its manual method of record keeping was failing to get data to the appropriate people quickly and consistently.

"Our manual systems resulted in a number of duplicate bookkeeping entries in various departments within the company," said Waldemar Arndt, general manager. "Of course, while it was necessary to have multiple bookings of information, the more times any piece of data is handled, the greater the risk of inaccuracies creeping into the information. The information we were getting was also not very timely," Arndt continued. Much of the data the company eventually did collect, Arndt added, was not standardized, and in intradepartmental meetings, a combination of data entry discrepancies and nonstandardized formats made it difficult to handle existing problems. The company decided to explore how a computer could provide solutions to some of these problems.

Lawrence Pumps conducted an extensive research and evaluation process to locate the best hardware and software solution for the firm, Arndt said.

"We really felt the software should adjust to meet our particular requirements and way of working — within reason," Arndt said. "What we were really looking for was a way to reduce the immense clerical participation in our manual systems and to give our managers more decision-making time with better data."

The company identified four potential vendors and, after evaluating their offerings, decided on a software program from Interactive Management Systems, Inc. named MRP II (material requirements planning), a financial and manufacturing information management package. Interactive's name was later changed to White Hat Systems, Inc., headquartered in Woburn, Mass., following a January 1984 merger with Manufacturing Resources, Inc.

According to Arndt, White Hat Systems fit the company's requirements from a product perspective and met its expectations for a company that would be large enough and stable enough to meet the need while also being attentive to Lawrence Pump during the transition.

"We also wanted a fully integrated, divisionally and departmentally compatible system." Arndt said. At the same time, the company was in the process of evaluating and installing an Auto-trol Technology Corp. computer-aided design and manufacturing workstation running under a Digital Equipment Corp. VAX-11/750.

Arndt said the company liked the fact that White Hat's software would run on the DEC equipment, and "we felt they offered one of the more complete software packages."

Lawrence Pumps said it has experienced operational efficiencies and cost savings with the software. Inventory levels have been reduced by about 20%. Current information on payables and receivables dramatically improves cash flow, Arndt said.

"We all speak the same language now in terms of data received from department to department," he said. "And all our managers, from the factory floor where the system performs shop-floor control to production costing to the warehouse where our inventory is being better monitored, understand how and why the system works."

You have to think
ahead a few moves to win
the network game.

Minis gear direct-mail firm for election cycle

ALEXANDRIA, Va. — Four years ago, the president of a direct-mail company here was looking for an outside firm to handle the growing needs of his clients. When he could not find a company to meet his standards, he decided to form his own.

Bud Esper is the president of Clesa Systems Development Corp. Today his clients include various charitable organizations, schools and churches that provide business for Clesa throughout the year. But the company also has many politicians as clients. And the weeks before the November general election were the busiest time of the year for the firm.

During its first few years in business, the company leased data entry terminals. But when the 1984 election cycle began to gear up a year ago — and mail volume began to grow — Esper decided to replace his existing equipment.

"I was looking for a system with bus architecture [and] distributed processing. I also wanted equipment that was flexible and could handle various application programs and peripheral devices," Esper said.

Esper decided that tape conversion would be easiest in a minicomputer or superminicomputer environment. He looked at various systems and decided on Recognition Equipment, Inc.'s (REI) Tartan Terminal System.

"The REI system offered the features I was looking for and has the strongest data entry software available," he said. He said that tape conversions with the REI system are averaging 45 minutes to one hour.

"We've been able to lower our costs in both key entry and production, and we've been able to give our clients better service through faster turnaround and by being able to reduce our prices [for] our clients," Esper said. "We've seen a 30% reduction in prices for production."

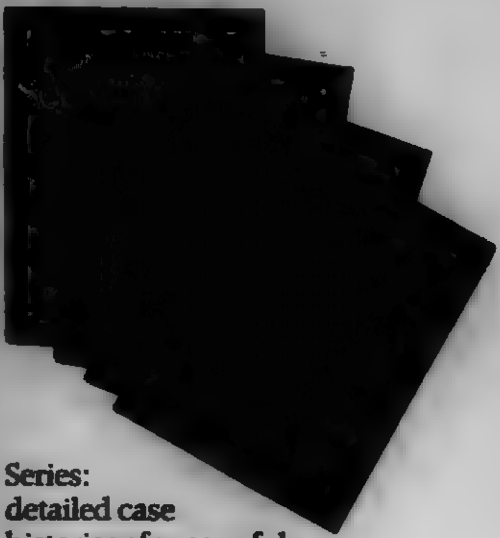
Targeted mailings

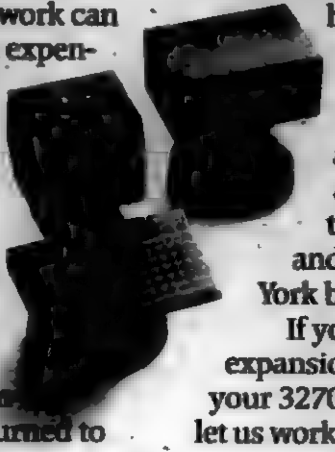
To provide its service, Clesa maintains a detailed mailing list and data base for each client, which allows the client to direct each letter specifically to a target audience. Such targeting by Clesa's clients is typical, and it puts more demands on a data entry system than a more routine use.

Esper uses 12 Tartan terminals and eight letter-quality printers from REI. During the months before the November election, the company was running three shifts daily.

Each Tartan terminal and each peripheral has its own independent processor connected through high-speed buses. As additional terminals or peripherals are required, they can be added. When the system is completely filled, an additional cabinet, bus, interbus connector and terminal can be added. For software, Esper uses a key entry program from REI.

After more than a year of using the equipment, Esper said routine downtime is rare and keystrokes per terminal are high.





ATEGIES

Datastream can help you develop and implement a strategy that will lead to the 3270 network your company needs. We can show you how to utilize existing equipment (even hardware that is not mainframe compatible) to give more people in your company access to your network, without compromising security. And, we can show you how your network can grow without expensive cable or leased lines.

In Good Company

As the 3270 network concept has grown, more and more companies have turned to Datastream for planning and for precision products that provide a system solution. We are pleased to have played a major role in new networks for RCA Service Company, GTE Sprint, Manufacturers Hanover Trust, and even Xerox.

We can also show you how Datastream system strategy helped a Texas data processing network expand its services to 214 new school districts while saving $500,000. Similar success stories have occurred at a semiconductor manufacturer, an insurance agent automation company, and a large New York bank.

If you have expansion plans for your 3270 network, let us work with you. And if network expansion is still on the "back burner," now is a good time to find out more about Datastream. Return the coupon, and we'll send you our new Application Series: detailed case histories of successful network strategies. We're ready to help you.

Send me your Application Series.

on your VAX like never before.

You need to know exactly how your VAX computer is being used. Who uses it. On what projects. For how long. And especially, at what cost.

PACS PLUS tells you everything. With sterling ease. Precision. Simplicity.

It's the only VAX/VMS cost control software that lets system managers select, examine and edit resource data via on-screen forms and simple keypad commands.

It has an incredible report writer that allows multi-level reporting on up to 30 system variables, including node, account, project, user, session, image, etc. These reports can be used to assess system performance and simplify capacity planning.

Our original PACS™ system accounting software is found in more than 500 locations throughout the world. It's won an ICP Million Dollar Award and is even sold by DEC itself. In fact, we're the leading independent developer of VAX/VMS software.

Find out what PACS PLUS can do for you. Call our toll-free number for a free information kit. Learn how, for only $3900, you can get control of your VAX. Call today. It could be later than you think.

"We need upgraded VAX System capabilities"
"We need lower VAX System costs"

THEY BOTH CAN GET WHAT THEY NEED WITH
HAMILTON VAX SYSTEM RENTALS!

No Capital Expenditure Your capital is not tied up in depreciating equipment that is not directly earning revenue. Low rental costs can be approved immediately from departmental operating budgets.

Accounting Benefits Rental payments can be deducted for tax purposes while preserving credit lines. (Does not require balance sheet notation.)

Simplified Budgeting Paying for today's expensive equipment with tomorrow's devalued dollars at constant rates not subject to interest fluctuations.

Avoid Obsolescence Upgrade equipment at any time during the rental period. (Rental-with-purchase option plan is also available.)

Applications Software Full range of Office Automation, DBMS, CADD, Process Control and Utility Software can be included in the rental.

Hardware Configuring Hardware configuring of Floating Point Systems array processors, Tektronix, Hewlett Packard, Calcomp, Nicolet, Data Products and Printronix peripherals all integrated with the VAX rental.

Turnkey Solution All shipping, installation and manufacturer's maintenance are provided by Hamilton, who has installed thousands of systems worldwide.

Quick Delivery....from stock. Rental plan for as short as three months or as long as three years.

VAX is a trademark of Digital Equipment Corporation

The New Cincom: 10
the only software ve

Finally, there's one software vendor offering a single family of integrated products capable of meeting all of your corporate, departmental and personal information software needs—The New Cincom Systems. Our TIS™ family of integrated products is improving performance and productivity in major organizations around the world. Here are just 10 of the many reasons why your organization should be considering TIS:

#1 Relational Data Management Technology

Powerful relational data management technology forms the "nucleus" of our integrated software family. Using a unique "Logical View" concept, all applications operate directly with "derived relational tables." As a result, we can provide complete data structure independence, as well as the high performance needed for today's production environments. This relational technology is the nucleus of both our TIS family of information products for IBM users and our ULTRA INTERACTIVE DATA BASE SYSTEM™ for DEC™ VAX™ users.

#2 Fourth Generation Application Development

The perfect complement to our relational data management technology is our industry acclaimed 4th Generation application development system, MANTIS™. In more than 1,500 complex production environments, MANTIS is dramatically reducing the application backlog through its powerful ability to "prototype", refine and commit the application to production in one interactive sitting.

#3 Manufacturing Control Software

CONTROL™: MRPS is our sophisticated manufacturing control system that is fully integrated

You should know how our integrated family of software technologies meets all your information processing needs.

reasons why we're
ndor you'll ever need.

with our relational data management technology. A complete closed-loop system, MRPS is improving the productivity and profitability of over 125 IBM and DEC VAX manufacturing environments around the world.

#4 Financial Control Software

CONTROL: Financial is our sophisticated financial accounting and control system which molds to the way you do business. Integrated directly with MRPS, CONTROL: Financial includes Accounts Receivable and Credit Management systems with Accounts Payable soon to follow.

#5 Advanced Network Management

NET/MASTER™ is one of the most recent additions to the TIS family of integrated products. Very simply, NET/MASTER is an advanced network management system that takes the complexity out of managing a sophisticated IBM computer network and lays the groundwork for distributed data base processing.

#6 The Interactive Mainframe—Micro Link

Further expanding the capabilities of our software information network is PC CONTACT™, our mainframe-micro link which enables users to interactively upload/download data between the mainframe and IBM PC's. PC CONTACT gives the PC user the ability to access multiple file types stored in the corporate data base for Decision Support manipulation.

#7 Micro Decision Support Software

For comprehensive micro-level Decision Support we offer SeriesOnePlus™*. SeriesOnePlus includes file management, spreadsheet, graphics, reporting and word processing components that are all integrated through a unique "BUS" architecture. Because the system is designed exclusively for business situations, SeriesOnePlus complements any mainframe-micro network strategy.

#8 Mainframe Decision Support Software

The recently introduced MANAGE USER SERIES™ provides powerful Decision Support capabilities for the mainframe user. The MANAGE USER SERIES combines graphics, text processing and application development tools to enhance the use and display of corporate data.

#9 Client Support

The one thing that isn't new about Cincom is our unrivaled commitment to service, support and user education. When you choose Cincom you can be assured of the highest caliber of support.

#10 Software Excellence

Why the New Cincom? Well, we like to think of ourselves as the New Cincom because every product in our TIS family of integrated technologies has been released since 1981. And, quite frankly, we believe TIS provides the highest degree of reliability, integration, performance and value in the industry.

But don't take our word for it. We invite you to personally compare TIS with what our competitors are offering. Then you'll understand why the words "Excellence In Software Technology." fit so well under our name.

To Learn Even More About the TIS Family of Integrated Products, Call Or Write For Our Brochure: "THE NEW CINCOM: WHAT EVERY INFORMED SOFTWARE BUYER SHOULD KNOW."

EDITORIAL

Will the U.S. call Big Blue too big?

It was no surprise that the U.S. Department of Justice, in reviewing IBM's proposed merger with Rolm Corp., was more concerned about the prospect of reduced competition in the area of military appropriations than in the area of private enterprise.

The consent agreement — by which Rolm and IBM agreed to spin off Rolm's Mil-Spec Computer Division — and the clean bill of health given the remaining parts of the merger are defensible when the agreement is studied microcosmically.

With Rolm already accounting for approximately half of the market for computers made for military specifications but using commercially available design and software, and with IBM's admission to the Justice Department that it intends to enter that market, the potential for IBM domination was a legitimate concern.

In the telecommunications area, however, Rolm is just one of many players — albeit one of the largest and most promising — and IBM has had little success in this area.

The consent agreement falls in line with the antitrust philosophy of the Justice Department under the administration of President Reagan. That philosophy, of course, was delineated with the Jan. 8, 1982, decision to drop outright a decade-long antitrust action against IBM, with the declaration that there was no basis for the action.

Macrocosmically, the Rolm-IBM merger could prove to be a major factor in the ongoing concentration of the U.S. computer industry.

Since the antitrust action dropped in 1982, IBM has shown that in certain key areas it can dampen competition simply by pursuing its business goals.

In the area of large mainframe computers, IBM's established base and its ability to develop and move new equipment rapidly has effectively shut off from competition some 70% of the large-scale CPU market. In the area of storage for those large-scale systems, IBM's newfound efficiency has effectively narrowed domestic competition down to one company. In the microcomputer area, the fear of IBM's ability to tie up small companies in court has effectively quashed the hopes of several relatively small companies that had planned to grow on a commodity operating system that IBM sanctified as a standard but had limited through use of a proprietary basic I/O system.

IBM has not yet been able to constrain the mini/superminicomputer market, but it has clearly turned its withering gaze on that area. It also has uncharacteristically declared its intent to be in the forefront of factory automation and networking.

IBM has made evident its intent to be a major factor in the relatively infant arena of deregulated telecommunications. With its majority stake in a long-haul carrier, its unfolding local-area network, its computer products hitting every category from top to bottom and now the acquisition of a major private branch exchange vendor, IBM clearly is positioning itself to be the *total* systems provider.

Competitors must fear IBM's potential to do with telecommunications what it did with mainframe computers and what it appears to be doing with microcomputers. Such events might assuage the Reagan administration's fear of the Japanese vendors, but they certainly won't do much for a competitive domestic environment. And at some point, the power of Big Blue is going to attract the scrutiny of a Congress that thrives on protecting individual commercial interests.

'Stop, thief!'

LETTER

A clear case for documentation

The real story is sorely lacking in "Multiusers micro a tough DP sell" [CW, Oct. 29]. IBM chose not to offer a high-performance micro because the machine would compete with a lucrative System/34 and System/36 marketplace.

Therefore, MIS types — largely uninformed about new technology and alternative processing methods and led by the nose by IBM marketing — will continue to fear that [other] departments will find out they do not really need MIS.

I, for one, am sick of hearing the typical small systems scare stories created by this largely unprofessional group. The new breed of supermicros runs up to 2.5 million instructions per second and [has] 8M bytes of real memory, serves 16 or [more] users and [can handle] more than 1G byte of disk [memory]. They run numerous truly relational data bases, all vastly superior to those IBM offers.

I also fail to see user-friendliness in IBM's multiuser operating systems. As for developing software, supermicros and superminis offer excellent environments for the development cycle.

Hardware in the $20,000 to $150,000 price range should be serving departments and other functional pods of processing within large departments, but MIS will generally not allow [this because it might diminish] its centralized empire.

In short, supermicros are not acceptable to large corporations because they are not made by IBM, and they promote decentralization. The headline could have just as well referred to conventional minis or superminis.

VIEWPOINT

Draggin' out the dragon

LECHT ON SCIENCE
Charles P. Lecht

"Tokyo University Succeeds in Non-Neuman-Type Computer — In Quest of Fifth-Generation Machine" read the headline in the *Asahi Evening News* on Nov. 7. It was exceeded in print size only by the pronouncement of President Reagan's victory and shared the top of the daily's front page. Someone's draggin' out the Japanese dragon again, I thought. For the past five years, it has been the most effective government fundraiser for computer research we could find, exceeding even the Soviet hair-raising threat of a nuclear Armageddon.

If the Japanese fifth-generation project can produce such sensational results to be worthy of such notice, we may want to consider joining the Japanese government to present it to the Russians as a reason to get on with serious disarmament negotiations. Or we may want to think about subcontracting all our computer systems research to Tokyo University.

The scare-producing fifth-generation dragon's nourishment over the past five years has been roughly $450 million; IBM and AT&T alone can be expected to spend in excess of $6 billion in R&D during 1984. Our Department of Defense is spending $600 million on the same type of work as is the Japanese government in its fifth-generation computer project. Draggin' out the dragon in the Asahi newspaper should help get this hiked. As a minimum, it should increase the flow of cash into our universities that sorely need it, so its effect cannot be judged as all bad.

I'm sitting here in Tokyo trying to figure out who or what has been and continues to be behind the idea that the Japanese computer and communications industries are anywhere close to ours in their ability to create computer systems — not to speak of competing with these in the world marketplace. Not that we can complacently ignore Japan's achievements as meaningless in the scheme of things commercially competitive. But we do have to keep our perspective on the issue. As 1984 draws to a close, the Japanese are still so far behind us in the development and volume manufacture of medium- and large-scale computer systems that it is doubtful that they could ever catch up to us in this century. And their use of personal computers is so far behind ours that one gets the impression that there is a law in Japan requiring that all personal computer technology be exported. Even if Japanese citizens have home computers, they are still unable to use them as easily as we do in America: All communications in Japan are still hard wired.

As 1984 draws to a close, the Japanese are still so far behind us in the development and volume manufacture of medium- and large-scale computer systems that it is doubtful that they could ever catch up to us in this century.

With IBM and other data processing companies now joined by AT&T and other communications companies, the new DP communications industry in the U.S. — which, for lack of a better name, we can call the information services industry — can account for about $150 billion.

Include in this our new DP communications companies, our software companies and Merrill Lynch & Co. and IBM or just plain banking with data processing like New York's Citicorp — and the growing community of others of similar genre — and I think it would be conservative to estimate the value of the entire lot at over $200 billion.

Today's Japanese computer industry cannot account for more than a small percentage of the world marketplace commanded by our information services industry. Even when Nippon Telegraph and Telephone Co. (NTT), soon to be deregulated, and other companies like the Japanese National Railway join Japan's computer industry, its combined volume will be less than 20% of ours, the overwhelming majority of which will be in Japan.

A paltry few percent

By installed base, the Japanese share of the world marketplace, once again, is reduced to a paltry few percent. To put this in perspective, remember that Japan has a population that is roughly half the size of ours.

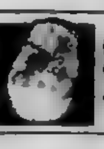
Of course, measuring the information services industry is no easy task — in America or Japan (after NTT's deregulation). Its constituent parts frequently have foggy boundaries where the bucks are biggest. No longer can we simply count chips or small, medium and large computer systems, multiply these by known values and come anywhere close to estimating the size of a country's part of the world marketplace. The emergence of massive time-sharing systems that dispense the powers that computer systems provide — like telephone service — and which serve to extend the powers identified with a particular computing device on an ad hoc basis, provide us with example enough to bring home the point.

As if this were not confusing enough, consider the fact that many industries previously not thought even remotely connected to electron-

See DRAGON page 52

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

Cutting the fat out of user training budgets



HUMAN CONNECTION
Jack Stone

Configuring an optimum computing system for user training in personal computers is an interesting challenge for large organizations seeking ways of cutting the fat out of their internal educational budgets while maintaining, or improving, effectiveness. The time is ripe for reconfiguration studies because of the vast numbers of compatibles currently flooding the marketplace and the accompanying price cutting.

Let's take a look at some ideas that may have merit for your company. First, the classroom situation with the live instructor. Many firms organize their hands-on personal computer training rooms around single-user machines with essentially the same configurations as in operational departments. All well and good. However, a number of companies have not yet chosen to standardize on a single system (plus clones) and currently operate several incompatible systems, for example, Digital Research, Inc.'s CP/M, Microsoft Corp.'s MS-DOS and AT&T's Unix.

Clearly, a classroom for each vintage is nonsense. On the other hand, a powerful, multitasking personal computer, outfitted with a single processing unit plus terminals at the student stations that can run all major operating systems — concurrently and as fast as lightning — makes very good sense. Such is the capability of, for example, Dallas-based Microcraft Corp.'s Dimension 68000 Personal Computer.

Cost-saving prospect

Dimension incorporates the Motorola, Inc. 68000 L8 processor chip, which provides the speed required to support up to 16 student terminals. In addition, special-purpose emulation hardware, when coupled with optional coprocessors — one for each type of operating system — supports virtually any 8-, 16- or 32-bit-oriented software. Clearly, using Dimension or some similar system offers prospects of substantial cost savings over multiple single-user machines.

For those organizations committed to the IBM Personal Computer and compatibles, recent price slashing has produced some interesting machine alternatives for the classroom setting. For one, the IBM PCjr starts to look very attractive as a low-cost alternative to IBM's Personal Computer since discounters are selling the basic setup — 128K bytes of random-access memory (RAM) and a single 360K-byte disk complete with color monitor (of less than exemplary quality) — for under $900, even less in quantity. Most important, one can avoid the expensive upgrades of RAM and disk (to 256K bytes and twin drives) usually associated with business programs in common use (Lotus Development Corp.'s 1-2-3, Multimate Software Systems, Inc.'s Multimate and others) because the PCjr programs are supplied in read-only memory (ROM) cartridges and will run on the basic PCjr configuration.

Although the new keyboard arrangement of the PCjr and other of its features are still less than desirable, a savings of about $1,200 per station by using a sale-priced PCjr instead of a full-blown Personal Computer (discounted to about $2,100), tends to justify it for the training function.

Alternative to PCjr

An alternative to the PCjr for this environment is the Tandy Corp. Tandy 1000, the newest Personal Computer clone. Discounters are now offering this machine with monochrome monitor and the same base configuration as above for about $1,150. In addition, they toss in a kindergarten version of an integrated program, replete with word processing, spreadsheet, filer, telecommunications, office utilities and so on, which, by the way, may be just the ticket for some elementary computer literacy training.

And on the subject of literacy and Tandy, the TRS-80 Model 100 4-lb laptop is worth some investigation. The 32K-byte RAM — plus 32K-byte ROM — version is now available from discounters for about $500 (as opposed to $900 original list price). Add to this machine some new, low-cost, simple software from Tandy and the independents to offset the deficiencies in the current built-in programs, and you have an economic self-training machine that can familiarize some members of the user population with computers and bring them into a semiliterate state. Furthermore, when and if the Model 100 fulfills its elementary training mission, it can be used operationally as a terminal for data entry or as a remote operator console for an IBM Personal Computer. ⌧

SHE'S TEMPORARY. THE DAMAGE IS PERMANENT.

One wrong key.

The slightest slip.

And your accounts receivable are accounts irretrievable.

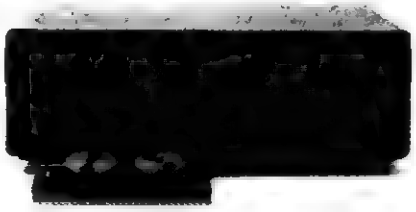
It can happen to you—because a leading cause of data loss is human error. If you employ people and computers, you're vulnerable.

Unless you backup your data.

Every day.

No matter what.

The smartest way to do that is with a Tallgrass HardFile™ Mass Storage System.



Shown above, the 20 megabyte HardFile with 20 megabyte tape for $2,995.

TALLGRASS SELLS MORE HARD DISK STORAGE WITH CARTRIDGE TAPE BACKUP THAN ANYONE IN THE WORLD.

Tallgrass took the industry's most reliable medium—magnetic tape—and perfected a format that's become the standard for personal computers.

We used a removable tape cartridge to store data out of

harm's way. And made two versions. Our 3000 Series HardFiles combine tape's accuracy with the enormous capacities of hard disk, providing 12, 20, 35 or 70 megabytes storage with a removable cartridge tape for backup. Our 4060 tape storage system, for personal computers with hard disks built in, supplies 60 megabytes of backup capacity.

Result: the world's best selling mass storage systems with the most reliable data protection.

The only kind to have when facing a permanent problem.

For a free brochure, your nearest dealer, and more good reasons to backup, call 1-800-228-DISK. And solve your problems permanently.

VIEWPOINT

DRAGON

from page 53

ic data processing or communications are now solidly in its midst, (for example conferencing and entertainment) and the mind begs to ask where it will end.

No job for bean counters

Thus, sizing the industry is no job for the bean-counting economist of the past. And I suspect that whatever model we may create will fail to provide us with the kind of certainty we would like in the future; a new framework is needed, one that is as yet undiscovered.

The English language newspapers in Japan during the week of Nov. 5 betray the confusion that consumes the world computer and communications industries in figuring out who is ahead of who. Consider the following article in the *Asahi Evening News* by Philip M. Boffey, New York Times News Service.

> *'The Japanese marketplace is more open than we care to admit; [the U.S. marketplace] is more closed than we believe. Our relationship to Japan is the most important bilateral relationship we have — bar none.'*
>
> — Mike Mansfield, America's Ambassador to Japan

The headline read: "The Race for Computer Supremacy — Military, Political and Economic Stakes are High." A second line read: "U.S. and Japan Slug It Out Chip For Chip." After pointing out that American opinions of the Japanese computer industry may have been a bit exaggerated, the article went on to confirm it.

"As the great computer race intensified, so too did the confusion generated by a blizzard of claims and counterclaims, scare stories and reassurances, media exaggerations and self-serving pronouncements from individuals who stood to gain or lose from whatever government actions might be taken to counter the Japanese."

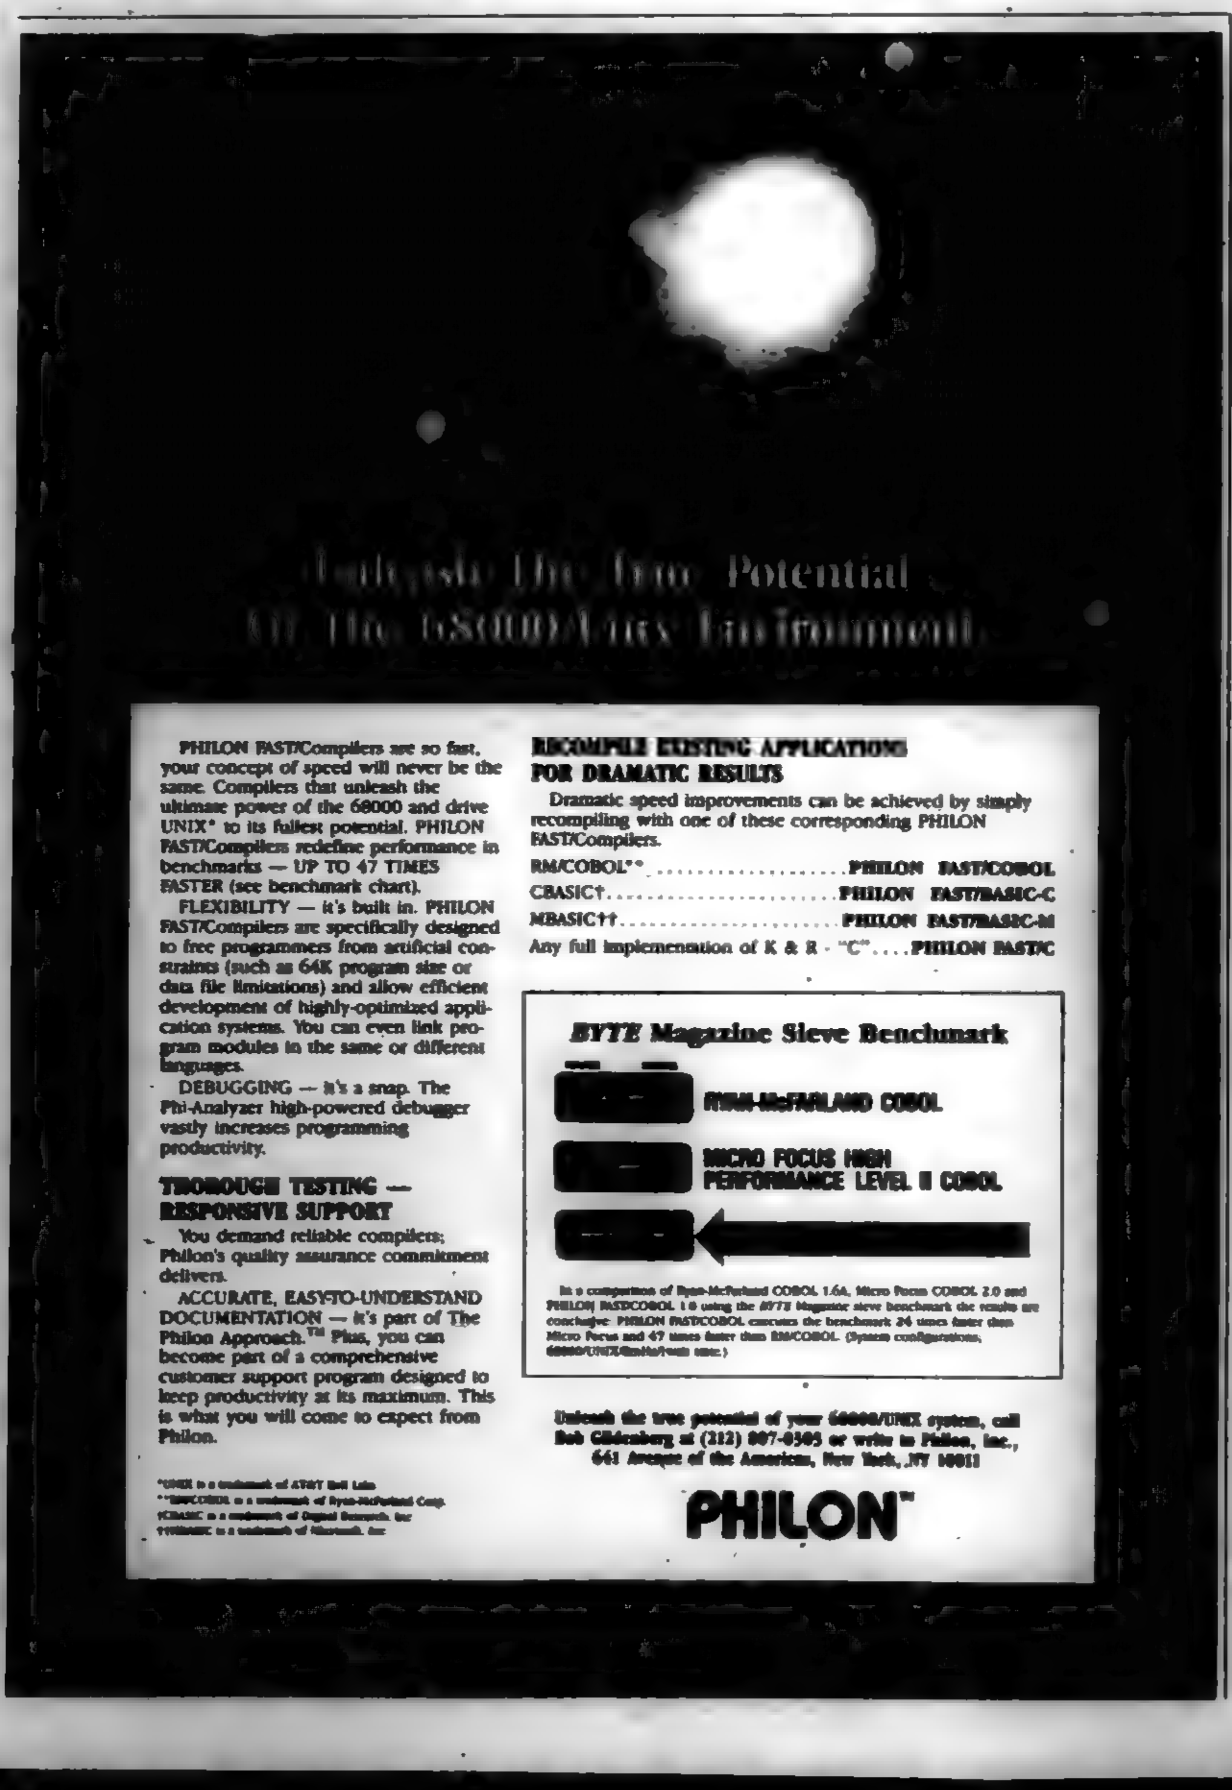
The article went on to say, "The computer race excites conflicting emotions in the technical community." George A. Keyworth 2nd, the White House science advisor, has been quoted as saying in reference to the so-called Japanese threat, "It's important, but I think it's been blown out of proportion."

Notwithstanding the sensationalist headline the article sports, the backpedaling on the Japanese threat to our computer supremacy by members of the American scientific community represents a shift in the attitude of some American scientists. This shift is heartening, and one hopes it catches the attention of the others who seem too happy to drag out the Japanese high-tech threat every time they get to fund-raise.

Maybe we can get things back on track again so that we can better focus upon our real adversaries in this increasingly technological world. Americans forget that the Japanese may be our only ally in this world who finance our forces abroad on their own territory, thus contributing to our safety at home.

This includes housing, utilities, labor and free rent, according to America's Ambassador to Japan, Mike Mansfield. "The Japanese marketplace is more open than we care to admit; ours is more closed than we believe," he said. Summing up his remarks on my visit to his office, he said, "Our relationship to Japan is the most important bilateral relationship we have — bar none."

I cannot help but agree with the ambassador. In fact, I believe that Japan may be one of the only friends we have who is not on the dole. And, in a world increasingly technological, we can use all the friends we can get. I suggest that Americans put away the dragon; we've got enough cause to support increased spending on high technology without it.



Unleash The True Potential Of The 68000/Unix Environment

PHILON FAST/Compilers are so fast, your concept of speed will never be the same. Compilers that unleash the ultimate power of the 68000 and drive UNIX* to its fullest potential. PHILON FAST/Compilers redefine performance in benchmarks — UP TO 47 TIMES FASTER (see benchmark chart).

FLEXIBILITY — it's built in. PHILON FAST/Compilers are specifically designed to free programmers from artificial constraints (such as 64K program size or data file limitations) and allow efficient development of highly-optimized application systems. You can even link program modules in the same or different languages.

DEBUGGING — it's a snap. The Phi-Analyzer high-powered debugger vastly increases programming productivity.

THOROUGH TESTING — RESPONSIVE SUPPORT

You demand reliable compilers; Philon's quality assurance commitment delivers.

ACCURATE, EASY-TO-UNDERSTAND DOCUMENTATION — it's part of The Philon Approach.™ Plus, you can become part of a comprehensive customer support program designed to keep productivity at its maximum. This is what you will come to expect from Philon.

RECOMPILE EXISTING APPLICATIONS FOR DRAMATIC RESULTS

Dramatic speed improvements can be achieved by simply recompiling with one of these corresponding PHILON FAST/Compilers.

Resting on GOP's laurels

We want to rest on the GOP's laurels.

"Data base gives Republican campaign resource edge" [CW, Nov. 5] mentioned the Republican National Committee's data base. However, you omitted the name of the data base management system (DBMS) the committee uses.

Since 1979, the Republican National Committee has used Software House, Inc.'s System 1022 DBMS for almost all its applications. Whether it's tracking financial contributions for a direct mail campaign or researching quotes for a rebuttal, System 1022 is the Republican National Committee's supporting software.

ACF2 snatches top spot

IBM's RACF lands near bottom of security stack, according to Xephon Technology Transfer poll

By Maura McEnaney
CW Staff

Users of IBM's Resource Access Control Facility (RACF) were among the least satisfied security systems users surveyed recently by Xephon Technology Transfer Ltd. of Berkshire, England.

RACF placed sixth out of seven packages examined in the survey. In the category of overall satisfaction, RACF came out just in front of Boole & Babbage, Inc.'s Secure.

Topping the list in overall satisfaction was Cambridge Systems Group, Inc.'s Access Control Facility 2 (ACF2), followed by On-Line Software International, Inc.'s Guardian; Top Secret by CGA Software Products Group, Inc.; Electronic Data System Corp.'s Security Access Controller (SAC); and Boole & Babbage's Secure/CICS.

Using a 100-point scale, respondents were asked to rate their access control packages in the categories of ease of installation, ease of administration, facilities offered, security, degree of disruption, reliability, performance overhead, vendor support, documentation, training and monetary value. RACF's rating was below average in each of the categories except reliability and vendor support, the survey said.

Despite these low ratings, however, the survey indicated that the majority of RACF users rate it satisfactory or better, and none said he would not recommend the package to other users.

In the ease-of-installation category, RACF had the highest percentage of users (18%) who found installation more difficult than expected, the survey noted. ACF2, which had the most users phasing in the package, had the highest percentage of users who found installation easier than expected.

The average time users spent installing the packages exceeded the time suggested by the vendor. ACF2's recommended time of installation is a half day, but 45 man-hours in 21 days elapsed before the average installation was completed, the survey

Independents gaining ground in IBM-dominated DBMS mart

By Charles Babcock
CW New York Bureau

While IBM still dominates the market for data base management system (DBMS) software, independent suppliers are gaining market share, according to a recent survey by International Data Corp. (IDC), a Framingham, Mass.-based market research firm.

By 1988, the market for DBMS is expected to reach $1.6 billion, with independents expected to capture just under half of those sales. That represents a gain for the independents; figures from the end of 1983 showed that IBM accounted for 62.8% of the market, IDC said.

In particular, the independents "have really made headway in cracking open [the IBM 4341] marketplace," wrote Ann L. Morley, IDC senior software consultant and author of the report.

"The independents have obviously been effective in targeting the idea of the information center data base and dual data base strategy," she observed, noting that 4300 series users often buy an independent's DBMS to supplement IBM's 14-year-old IMS.

According to a questionnaire IDC mailed earlier this year to 1,003 IBM mainframe sites, the two biggest gainers in the DBMS marketplace appear to be Cullinet Software, Inc. and Applied Data Research, Inc. (ADR). A total of 96 users said they would buy a DBMS product by the end of 1984, and their purchases would be broken down among the following vendors:

- IBM's IMS — 10.4% of the purchases. If the sample is accurate, the figure represents a potential decline in IMS market share. IMS accounted for 20.8% of the in-

Version 4 of Method/1 out

CHICAGO — Arthur Andersen & Co. has introduced Version 4 of its Method/1 systems development methodology.

Enhancements to the latest version are said to include on-line, menu-driven software tools for system design, as well as a user guide.

Method/1 is primarily intended to support personnel involved in the planning, development and implementation of information systems for medium- to large-size companies, the vendor said.

Software packages

The product includes four system development software packages — Estimate/1, Track/1, Design/1 and Change/1; "how-to" manuals describing the system development process; 25 days of consulting assistance; and 40 hours of self-study materials.

All software packages operate on an IBM Personal Computer, Personal Computer XT or Personal Computer AT. Each package is said to support different but interrelated portions of the Method/1 process. For example, Estimate/1 is an on-line software tool that automates the estimating process for the systems design and systems installation phases of Method/1.

The software is priced at $50,000.

For more information, Arthur Andersen is located at 69 W. Washington St., Chicago, Ill. 60602.

AI techniques considered for DBMS use

By Bryan Wilkins
CW Washington Bureau

KIAWAH ISLAND, S.C. — An increasing amount of academic research is being directed toward applying the artificial intelligence techniques of expert systems to data base management systems (DBMS).

At the First International Workshop on Expert Data Base Systems held here recently, university and business researchers traded views on the desirability of using new AI query and inference techniques to manage complex DBMS.

Sponsored by the University of South Carolina's Institute for Information Management, Technology and Policy, the workshop produced a consensus that in the future, large data bases will require built-in logic aids to help programmers thread their way through the data.

According to Dr. Larry Kerschberg, workshop director, the worlds of AI and DBMS are meeting on a common ground of identical needs. "Data base management techniques are in a position to support AI where large data bases are required and where there need to be some strong rules of data management, such as [those contained in] dictionaries," he said.

"Data bases, while they are good at storing facts, have not generally been able to apply rules that are based on reasoning and inferences," he said. "We are trying to extend the concept of expert systems to handle large data bases."

Kerschberg said expert systems can update their knowledge base with data base processing information based on experience. They can also explain the sequence they use to arrive at a conclusion. Ideally, they could upgrade data bases with new data by deleting redundancies and inaccuracies, he said.

In the keynote address, John Miles Smith, vice-president of research at Cambridge, Mass.-based Computer Corp. of America, concluded, "In cases where expert systems and DBMS systems represent the same knowledge, both can support similar querying and explanation functions. However, DBMS can answer queries much more efficiently than expert systems."

Smith said expert systems still use a lot of computer power while DBMS have evolved to the point that they are more economical in computing and searching. The merging of an expert system with a DBMS should only be done where the power of inferential searches is really needed.

A strong difference of opinion arose over which of the two common AI programming languages, Lisp or Prolog, is more appropriate for the merger.

Lisp already has a strong presence in the AI market, yet there are inherent problems with Lisp programming, according to Kerschberg. Lisp has no reasoning capability, he said, while Prolog is capable of reaching inferential conclusions based on data rules already contained in memory.

However, another participant noted that Prolog is the language of choice for the Japanese Fifth-Generation Computer Project. Dr. Donald Marchand, director of the University of Southern California's Institute for Information Management, said a computer with Prolog could manage large, shared data bases with reasoning and explanation capabilities.

See how simple financing can be.

Now financing IBM equipment doesn't have to be a whole lot more complicated than signing on our dotted line.

To begin with, our master agreement is a mere four pages long. And you only need to sign it once.

Your signature will get you flexible financing. We offer a wide range of lease or installment purchase options to help you tailor a plan that suits your company's needs.

Your signature also gets you low rates. We're competitive.

And if you want to add or upgrade equipment down the road, a simple supplement to your original contract is all it takes.

So how do you go about getting IBM Credit Corporation financing?

Just call the same person who helps you choose the IBM computer or office equipment you need.

Your IBM marketing representative.

It's that simple.

IBM
Credit Corporation

Program writing routines out for HP's Vplus/3000

WARWICK, R.I. — A set of program writing routines and a subroutine library to be used in conjunction with Hewlett-Packard Co.'s Vplus/3000 data entry and forms management package were announced recently by Datasolutions International, Inc.

According to the company, Command/3000 V/Access is said to reduce VIEW SCREEN access to four program calls, allowing a programmer to write programs that provide users with an on-line access to their computer-based files.

The procedure reportedly can be used in conjunction with any Cobol application program for data entry, data base inquiry, data base update or any application that displays data through a terminal form.

V/Access routines are said to include an on-line stream facility, display control, print file access, automatic message file access, automatic two-stage refresh, function key control and an alphanumeric string edit and conversion. Command/3000 V/Access costs $2,500.

Datasolutions also announced the Command/3000 Subroutine Library, said to increase the range of I/O data handled by any program.

The product reportedly includes a series of string-access and manipulation routines, bit-access routines and a string-to-numeric conversion routine. Command/3000 Subroutine Library costs $695.

Datasolutions International is located at 88-89 Jefferson Blvd., Warwick, R.I. 02888.

Amdahl offers two tools for large DP environments

SUNNYVALE, Calif. — Amdahl Corp. has announced two software products for the improved management of large and complex data processing environments.

An interactive programming tool, the Modeling and Analysis Package (MAP), enables users to construct models of their computer systems in order to predict future capacity and performance requirements. MAP produces models to answer "what-if" questions in IBM 370 architecture environments, including IBM's MVS, MVS/XA and VM.

The MAP program replaces previously required manual compilation of variables, such as work load growth, system upgrades and configuration changes, thereby allowing users to forecast future needs more accurately, the vendor said.

Amdahl's System Utilization Reporting Facility/IMS (Surf/IMS) allows users to generate synthetic IBM IMS/VS applications in order to predict the effects of both software and hardware changes on current and planned IBM systems, according to the vendor.

Surf/IMS enables users to manage their software environments as they grow, the vendor said.

The annual license fee for MAP is $10,000, and the annual license fee for Surf/IMS is $6,600, with discounts available for multiple procurements.

More information can be obtained from Amdahl through P.O. Box 3470, 1250 E. Arques Ave., Sunnyvale, Calif. 94088.

SYSTEMS SOFTWARE

APOLLO COMPUTER, INC.
RJE Access Gateway

Apollo Computer, Inc. has introduced the Domain Networking Remote Job Entry (RJE) Access Gateway, which reportedly offers Apollo users bidirectional text file-transfer capabilities with a variety of remote host mainframes.

According to the company, the RJE Access Gateway software is said to emulate IBM's Hasp and 2780 and 3780 communications environments. With enhanced queue management facilities, the RJE Access Gateway gives all users on an Apollo Domain network access to remote environments using KMW, Inc.'s protocol converter, the company said. Through this method, users can transmit and receive text files in a batch mode to and from remote computer systems.

Apollo RJE Access Gateway is priced at $1,800.

Apollo Computer, 330 Billerica Road, Chelmsford, Mass. 01824.

KOLINAR CORP.
Kprobe enhancements

Kolinar Corp. has announced enhancements to its Kprobe dump analysis tool, which now supports any machine under IBM's VM/XA migration aid and IBM's VM/HPO Release 3.4. The package runs in conjunction with Kolinar's Xmenu/E display system.

The enhanced interactive, on-line system and dump viewing facility also supports preferred machine-assist guests and IBM's Assembler H labels and allows users to write transient command extensions. In addition, it offers a command for interrogating logical device blocks and

"I CAN MUX YOU NOW OR I CAN MUX YOU LATER"

Harry Losey
Product Manager

PROBLEM:
Your company is expanding. You must add terminals to your growing data distribution network. Present conduit space is exhausted. You are faced with the ever-spiraling costs of pulling more cable and the unnecessary downtime to effect network changes. You are running out of time.

THE NOW SOLUTION:
Discover the immediately available Fibronics Cable Bandit solution. A single installed fiberoptic or coaxial cable can now connect 32 of your terminals and printers. If you have 10 installed cables, you can connect 320 high data rate signals to remote peripherals up to a mile or more away. And your Cable Bandit system will interface with most major controllers.

The CABLE BANDIT SERIES is a range of fiberoptic or coaxial data distribution systems for use with 3270 type controllers from IBM, ITT Courier, Memorex and Raytheon. Bulky cables between controllers and terminals are reduced to a single cable without requiring additional interfacing devices over standard distances.
Find out how you can eliminate costly cabling, gain flexible networking alternatives, operate with local and remote control units, and expand your system with maximum cost-effectiveness.

INQUIRE®/Information Center:

The long-term software solution.

Information Center software always promises to help you, not hurt you.

But the reality is that this kindness is killing a lot of users.

In some cases, the software seems gentle as a lamb at the beginning, but murders you with inefficiency as soon as you add users or share data.

In others, the language alone is so complicated that it scares off end users before they start.

But with INQUIRE/Information Center, you can have the best of both worlds: a fast, smooth start. And steady, easy growth.

INQUIRE/Information Center offers a powerful, integrated set of tools for both beginning end users and MIS professionals. Beginning users create their own reports through simple fill-in-the-blanks screens—without having to learn a language. MIS professionals use more advanced facilities for specialized application development.

And beyond meeting immediate needs, INQUIRE/Information Center can expand into a comprehensive system encompassing text management and multi-user relational DBMS for both mainframes and PCs—the kind of system that makes an Information Center a true corporate resource.

INQUIRE/Information Center, from Infodata. It's the one system that really helps. And doesn't hurt.

For more information call or write Infodata Systems Inc., 5205 Leesburg Pike, Falls Church, Virginia 22041. (800) 336-4939. In Virginia call (703) 578-3430.

provides user-definable storage for analyzing non-Ebcdic dumps.

Kprobe and its source code are available for an initial license charge of $1,200 and annual fee of $2,400. Xmenu/E has an initial charge of $1,000 and an annual fee of $2,000.

Kolinar, 3064 Scott Blvd., Santa Clara, Calif. 95054.

INTERACTIVE SOLUTIONS, INC.
Help

Interactive Solutions, Inc. has announced an on-line Help documentation package for IBM CICS applications under IBM's OS or DOS operating systems.

No program or system modifications are required to install the Help package, the vendor said. Updating is available on-line.

Reportedly, when a question arises about the use of a field or when an entry is rejected, the user places the cursor under the field in question and depresses a predefined Help key. The application screen is then replaced by a display describing that field. The Enter key restores the original screen.

A permanent license for an OS or DOS environment is $9,995 for a single CPU.

Interactive Solutions, 140 Rt. 17 N., Paramus, N.J. 07652.

WANG LABORATORIES, INC.
Burroughs Terminal Emulation

Wang Laboratories, Inc. has announced its Burroughs Terminal Emulation package, which allows the Wang Professional Computer to emulate Burroughs Corp. TD832, TD834 and MT983 display terminals.

Functions supported in the software include a 1,920-char. screen, a 25th line for document status, local printer support and asynchronous and synchronous communications.

With the package, a Wang personal computer can communicate simultaneously with up to three Burroughs hosts and run up to 16 concurrent communications sessions. Background printing can be sent to a host-addressable personal computer printer concurrent with Burroughs terminal emulation.

Price of the Burroughs Terminal Emulation software license is $500.

Wang, One Industrial Ave., Lowell, Mass. 01851.

PRODUCTIVITY AIDS

CORTEX CORP.
Cortex Action Diagrammer

Cortex Corp. has released an action diagrammer, a visual programming aid that automatically displays the logical flow of a program. The package is a module of Cortex's other development tools for the Digital Equipment Corp. VAX-11 computer running under DEC's VMS. It can be targeted to run on other DEC minicomputers and small business machines, the vendor said.

The Cortex Action Diagrammer is a graphics language editor that provides a visual representation of very high-level program code that facilitates the addition of program logic to generated code, the vendor said. The editor also checks the syntax and consistency of code while it is being entered online.

The Cortex Action Diagrammer will be available in January and will be priced at $15,000, according to the vendor.

Cortex, 55 William St., Wellesley, Mass. 02181.

INFORMATION BUILDERS, INC.
Documentor

Information Builders, Inc. has released a relational methodology tool said to provide a framework for the design and documentation of an information system.

Documentor reportedly uses a menu-driven, screen-oriented approach that is said to enable systems designers and end users to automate definitions of system data and components and then track the components and their interrelationships as the design evolves.

According to the company, Documentor is built in the company's Focus language. The system reportedly includes a one-time data entry system, as well as built-in data entry forms and complete systems reporting. The software is available for Focus users running IBM's VM/CMS or MVS/TSO operating systems. Permanent license

for the product is $12,000. It can be leased for $400/mo with a one-year lease.

Information Builders, 1250 Broadway, New York, N.Y. 10001.

APPLICATION PACKAGES

MAGNATRON, INC.
Distributron

Magnatron, Inc. has introduced an integrated business software package for the IBM System/38 under IBM's CPF operating system.

Distributron reportedly allows multiuser processes and decreases auxiliary storage requirements, the company said. The series modules consist of accounts payable, accounts receivable, general ledger, inventory control, order processing/sales analysis and purchasing.

Each module reportedly contains on-line menu construction with screen and field-level Help, externally defined data and display files and multicompany processing.

All maintenance and entry-type programs are interactively edited, according to the vendor. IBM System/38 [illegible] source code is included.

Distributron sells for [illegible]

Magnatron, P.O. Box 90393, Knoxville, Tenn. [illegible]

DIGITAL EQUIPMENT CORP.
VAX Decalc Version 2.1

An updated electronic spreadsheet program that is said to integrate data base, graphics and communications functions was introduced recently by Digital Equipment Corp.

VAX Decalc Version 2.1 reportedly features financial, statistical, logical and trigonometric functions for VAX/VMS and Microvax systems. Supporting VT100 and VT200 series terminals, it reportedly integrates with the company's Datatrieve data base management program, Decgraph for presentations and with electronic mail and network support for information acquisition and distribution.

According to the company, VAX Decalc Version 2.1. includes financial functions such as Interrupt Return Register and discounted payback. The program is said to perform linear regression and calendar arithmetic and is said to allow multiple users to share data and graphics.

Base price of the VAX Decalc is $680 and increases with configuration.

Digital Equipment, 2 Iron Way, Marlboro, Mass. 01752.

UNICALC CORP.
Unicalc/DB Release 1.5

Unicalc Corp. has announced a release of its mainframe spreadsheet package for systems running under IBM's MVS and DOS.

Unicalc/DB Release 1.5 is said to offer multisheet or multidimensional processing. It also features a user command to provide access to data from any file structure on IBM mainframe computers.

Other features of the latest release are said to include a user-definable formula capability in which mathematical or business functions may be defined by a user one time, saved under an appropriate name and reinvoked at will in other spreadsheet operations. This feature enables users to expand the library of functions in Unicalc/DB without programming, the vendor said.

Another feature is an optional data management facility said to allow users to optimize the disk space assigned to them through archiving, space compression or deletion of their worksheets.

Unicalc/DB is supported under IBM's MVS/TSO, DOS/CICS and MVS/CICS, as well as Cullinet Software, Inc.'s Integrated Database Management System-DC in IBM MVS and DOS environments.

A site license is available at $16,500 for the MVS version and at $13,200 for the DOS version.

Unicalc, 2 Academy Lane, Wayne, Pa. 19087.

DATACOPY CORP.
Character Image Recognition

Datacopy Corp. has introduced an optional Character Image Recognition (CIR) system for its Word Image Processing System (Wips) software. Wips software runs with all Datacopy electronic imaging systems on IBM Personal Computers, Personal Computer XTs and Personal

The tree of communication symbolizes BULL's total commitment to information systems.

As one of the leading international manufacturers of data processing and office automation systems, BULL offers competitive and innovative solutions to all your information management problems, whether special or general, always designed to meet the specific needs of your business.

Moreover, BULL has developed an unmatched know-how in designing communication systems in order to improve interaction at all levels and in any situation. The result: an enhanced competitive edge and a better return on your information and communication investment.

In terms of hardware, BULL offers a wide range, from micro-computers to large scale data processing systems, including distributed data processing and office automation. For BULL, high quality data processing necessarily includes the availability of a full range of constantly updated services, which are under continuous development. To this end, BULL cooperates closely at international levels with software houses, universities, research centers and other manufacturers.

Whether your organisation is large or small, simple or complex BULL Distributed Systems Architecture (DSA) adapts to you and to your needs. It conforms to international standards (ISO) and has the inherent property of accommodating change. DSA is adaptable, flexible, and easy to use.

Strongly present in 74 countries, BULL is whatever you are. So why not let us plant your tree of communication... or help it grow?

Bull

Computer ATs, running under IBM's PC-DOS 2.0 or 3.0.

CIR reportedly processes image files of documents that have been scanned by Datacopy scanners. The software converts the text of these documents to standard Ascii code, which then can be processed using any standard WP software.

CIR comes in two versions: CIR-1 is preprogrammed for 10-point Courier and 12-point Prestige Elite fonts; CIR-2 is preprogrammed for the same fonts but adds an interactive learning capability, allowing the user to train the software to recognize fonts, letter patterns and handwriting.

The systems will be available in January. CIR-1 is priced at $695, and CIR-2 is priced at $1,995.

Datacopy, 1215 Terra Bella Ave., Mountain View, Calif. 94043.

COFFMAN SYSTEMS, INC.
Edge

Coffman Systems, Inc. has announced Edge, an on-line telemarketing package that runs under Pick & Associates, Inc.'s Pick operating system.

Edge monitors inbound and outbound calls and can handle from one to 250 users, according to the vendor. Edge reportedly allows a user to record and track a telephone call at an incremental cost of 50 cents per call.

The product is also said to store product descriptions, pricing and competitive comparisons. When an order is taken, the program generates invoices and shipping labels. Other features include data analysis and telephone utilization tracking capabilities and callback reminders.

Edge is priced between $5,000 and $60,000.

Coffman Systems, 13140 Midway Place, Cerritos, Calif. 90701

PARAGON TECHNOLOGY CORP.
Artwork Input Module

Paragon Technology Corp. has introduced its Artwork Input Module (AIM) software module for all computer-aided design and manufacturing (CAD/CAM) systems that generate industry-standard photoplotter output.

AIM reportedly allows the conversion, merging and manipulation of printed-circuit board and hybrid artwork from one file to another, regardless of the CAD system on which it was created. It is said to be able to read artwork data from tape and convert it into a Paragon-compatible data base.

AIM can update a data base of wiring and parts lists and conduct design rule checking of the data base.

AIM is priced at $5,000 and requires a 7-in. or 10-in. magnetic tape drive. It can be paired with any Paragon workstation.

Paragon Technology, 2199 Norse Drive, Pleasant Hill, Calif. 94523.

IBM
A Manufacturing Language/Entry Version 4

IBM has introduced a version of its programming language for high-function robotic systems.

A Manufacturing Language/Entry (AML/E) Version 4 was reportedly designed to program the IBM 7545 and IBM 7547 manufacturing systems, provide enhanced function in

SURVEY

from page 57

said. A one- to two-day installation time was recommended to Guardian users, however; the average site spent 25 man-hours in 18 days to complete the installation. IBM suggested RACF would take three to four days to install, but users found the process took an average of 40 hours in 26 days, survey results showed.

Top Secret's reputation for ease of installation apparently held true for users. According to the survey, CGA recommended half an hour to install the package, and users spent an average of 2.5 days and nine man-hours implementing the system.

Of all the products represented in about 25 sites, Guardian gave users the most intallation problems, the survey said. According to the survey, six Guardian sites had problems when moving to the latest version of IBM's CICS.

Documentation was said to be the most common problem of access control packages. "Although many users recommend others to read the manuals carefully before implementation, the documentation provided with all the packages (with the exception of ACF2) is rated poorly," the survey said.

Rating security features

Users rated security features of their packages in six major areas:

- The range or resources protected.
- The range of actions that can be monitored.
- The range of users that can be monitored.
- The ease of specifying security rules.
- The ease of modifying security rules.
- The reporting of violations.

According to the survey, ACF2 came out on top in the security category, followed by Top Secret, Guardian, RACF, Secure/CICS, SAC and Secure.

RACF placed sixth in the categories of ease of modification and specifying rules. "This might be explained by some of the inherent limitations of RACF," the survey said. "For example, it is not possible to specify protection to individual jobs or programs."

"Access Control Packages: Comparative Analysis" is available for $130 from Xephon's U.S. distributor, Publishers Business Services, P.O. Box 643, Cambridge, Mass. 02139.

* The 1983 sample planning to acquire DBMS software.

IDC CHART

DBMS

from page 57

stalled data base systems at the end of 1983 among the sites surveyed.

IBM's DL/1 — 18.7%. This represents a similar potential decline for a DBMS product that was in use at 42% of the sites surveyed at the end of 1983.

IBM's new DB 2 — 15.6%. Added together, IMS, DL/1 and DB 2 amount to 44.7% of the likely DBMS purchases, compared with IBM's 62.8% data base market share at the end of 1983.

■ Cullinet's IDMS and IDMS/R — 18.7%. Cullinet's IDMS was in use at 10.3% of the sites surveyed at the end of 1983.

> *'The independents have obviously been effective in targeting the idea of the information center data base and dual data base strategy.'*
>
> — Ann L. Morley, senior software consultant, International Data Corp.

■ ADR's Datacom/DB — 18.7%. At the end of 1983, Datacom/DB was in use at 4.9% of the sites surveyed, according to IDC.

■ Software AG of North America, Inc.'s Adabas — 7.3%. At the end of 1983, Adabas accounted for 7.5% of the packages in use at the sites surveyed, the study said.

■ Cincom Systems, Inc.'s Total and TIS — 6.3%. Cincom data base products were in use at 7.7% of the sites surveyed at the end of 1983.

■ Computer Corp. of America's (CCA) Model 204 did not appear in the survey results because the sites sampled were predominantly commercial users. CCA has succeeded in penetrating the government market, which is underrepresented in the survey, Morley explained. CCA accounted for 0.4% of the data base systems in use at the sites surveyed at the end of 1983.

■ Intel Corp.'s System 2000 was not mentioned in responses from sites that planned to purchase a data base system by the end of 1984. System 2000 accounted for 1.3% of the products in use at the end of 1983, according to the survey.

Uptime

Provide 24 hour CICS access

CICS Dynamic File Allocation is a must for effective CICS scheduling. It is the gateway to non-stop, round-the-clock CICS systems. It eliminates batch update constraints. It guarantees bullet proof restarts. It allows you and your batch jobs to add and remove CICS files at will, without disrupting your user community. Site license $3,000.

Browse CICS dumps on-line

The CICS Dump Display Facility provides immediate access to CICS dumps. CDDF is a no overhead "monitor" for production failures and test system abends. Selective dumps are completely formatted for CRTs and, the dumps can be printed immediately. Site license $3,000.

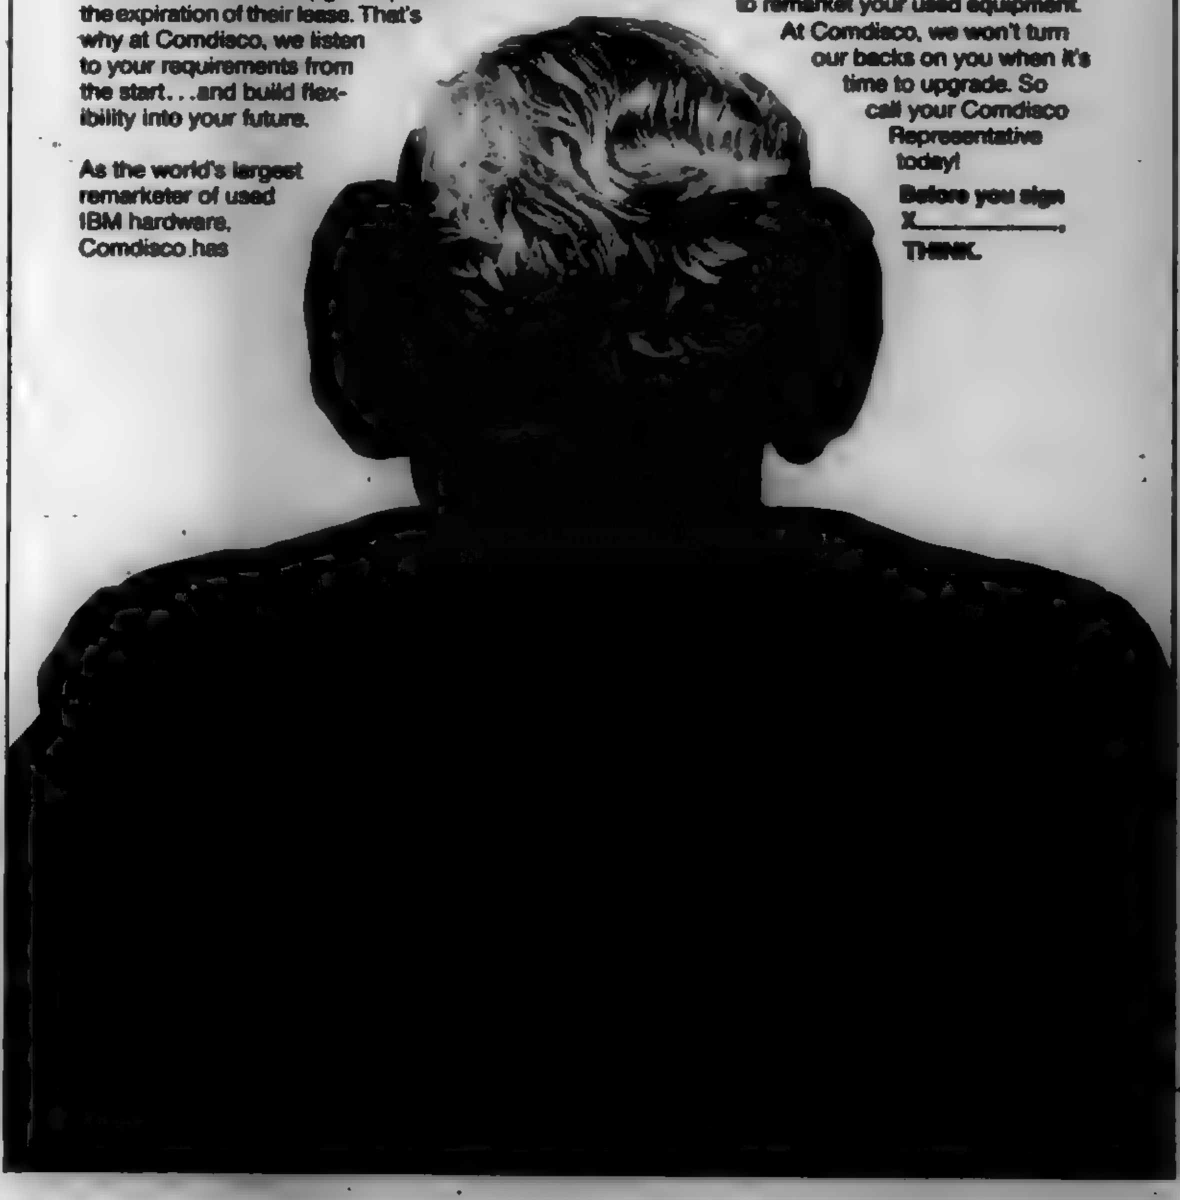
"Simple" Financing Isn't Always Upfront.



Financing isn't always as "Simple" as it's made out to be. And what's simple for a manufacturer doesn't always turn out to be simple for the Lessee. At Comdisco, we know how unanticipated capacity overload can cause certain lessors to back-down on the subject of upgrades. History has shown that 70% of our Lessees need to upgrade prior to the expiration of their lease. That's why at Comdisco, we listen to your requirements from the start. . .and build flexibility into your future.

As the world's largest remarketer of used IBM hardware, Comdisco has helped thousands of customers at upgrade time. Last year alone we remarketed over 650 CPUs and 10,000 peripherals which original Lessees decided to upgrade.

So when you're looking at your next leasing opportunity, look past the low numbers to full-service. . .and to the time when you'll need to remarket your used equipment. At Comdisco, we won't turn our backs on you when it's time to upgrade. So call your Comdisco Representative today!

communications and in edit, teach and compile processes.

A major feature of the software is said to be its ability to address computer-aided design and manufacturing requirements in communications and data-driven situations by providing host- and controller-initiated communications capabilities. A controller can request information from a host for the performance of a continuous operation, the vendor said.

To make full use of the enhancements in Version 4, a microcode change is required for IBM 7545 and 7547 manufacturing systems, which will be shipped to customers at no charge beginning Dec. 1, the vendor said. Machines shipped after that date will contain the necessary microcode. The new version is said to be upwardly compatible with Version 3.2 and can be used with IBM Personal Computers and the 5531 Industrial Computer with IBM DOS 2.1 and DOS 3.0. The software is priced at $3,250 per license.

IBM, Box 3025, Mail Stop 4006, Boca Raton, Fla. 33432.

MCBA
Release 2 HP Payroll

MCBA has announced a new release of its payroll package for Hewlett-Packard Co.'s HP 3090 series of computers, including the HP 3000 Series 37 under HP's MPE3 operating system.

The payroll package enhancements include an improved users manual format, interactive state and local tax tables, expanded workman's compensation capabilities, a direct deposit feature and a variety of methods for handling vacation and sick hours.

Source code licenses for MCBA's Release 2 HP Payroll range from $2,500 to $6,000, depending upon the hardware model.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.

NBI, INC.
Oasys Mail

NBI, Inc. has introduced an electronic mail program designed for use with the vendor's Oasys 64 cluster controller.

Oasys Mail is available on the vendor's Oasys 2000 and 4100 series personal computers and Oasys 4000 word processors. It is said to offer full-function text preparation tools and personal computing capabilities in creating messages. Up to five documents, including Microsoft Corp.'s MS-DOS volumes with up to 10M bytes of information, can be attached to each message, the vendor spokesman said.

To send mail, users address messages by providing the recipient's name or initials. Mail can also be addressed using job titles or a system code with a logon identification, the vendor said. Messages can be sent to individuals or to standard distribution lists.

Other features are said to include the capability for messages to be viewed, edited and forwarded as many times as needed. Mail can be delivered even when the recipient's workstation is powered off, the vendor said.

Oasys mail is priced at $7,500 on one Oasys 64 and $3,500 for each additional interconnected Oasys 64, according to the vendor.

NBI, P.O. Box 9001, Boulder, Colo. 80301.

DATA 3 SYSTEMS, INC.
MRPS 38-S Lot Control

Data 3 Systems, Inc. has announced a complete lot control and traceability feature for its MRPS 38-S manufacturing resource planning (MRP II) package for IBM's System/38 computer running under IBM's CPF operating system.

Lot Control can trace material lots from the time the material arrives at the receiving dock, through each process and into the final assembly of the finished product.

The price of MRPS 38-S Lot Control is $94,000.

Data 3 Systems, P.O. Box 441, Santa Rosa, Calif. 95402.

VERSATEC, INC.
Expert Illustrator

Versatec, Inc. has announced the Expert Illustrator graphics software for technical publication applications, running on the Versatec Expert engineering workstations under Xerox Corp.'s Pilot operating system.

With Expert Illustrator, graphics, engineering drawings and technical illustrations produced with the Expert Drafting package can be merged with documents produced with Xerox's Star software on the same workstation or be transmitted to other Expert workstations via Xerox's Ethernet local-area network, the company said.

A gateway to Digital Equipment Corp.'s VAX-11 superminicomputers is available via the Ethernet network for $16,000 per VAX-11 CPU, the company said. The price for Expert Illustrator is $4,500, the company said. Versatec workstations cost $15,895, and Star word processing software costs $1,200.

Versatec, Engineering Information Systems, 2710 Walsh Ave., Santa Clara, Calif. 95051.

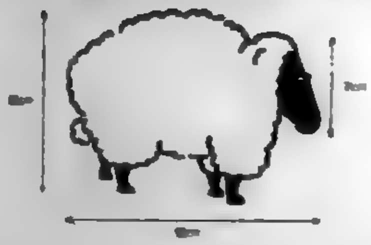
FLOATING POINT SYSTEMS, INC.
NAG Library for FPS-164 Scientific Computer

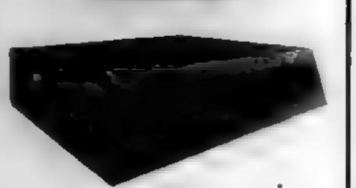
Floating Point Systems, Inc. (FPS) and the Numerical Algorithms Group, Ltd. (NAG) have announced that the NAG Fortran Mark 10 Library of numerical analysis and statistics has been converted to run on the FPS-164 Scientific Computer.

The NAG Library contains over 500 user-callable Fortran routines for a wide range of numerical analyses and statistical algorithms. The library is arranged into chapters covering topics such as eigenvalues and eigenvectors, simultaneous linear equations, inner products and time series analyses.

The price of the NAG Fortran Mark 10 Library for the FPS-164 is $1,200/year.

Floating Point Systems, P.O. Box 23489, Portland, Ore. 97223.





TAKE A MOMENT TO SIZE UP OUR COMPETITION.

Now that we've introduced the new AGILE 6287 Printer/Plotter Protocol Converter, there's one thing we can say about our competition:

they're a very nervous flock.

And for good reason. The overall quality of design and engineering is evident throughout the 6287. From its upgradability and optional APL, through its built-in diagnostics, internal power supply and fan, the 6287 assures you of consistent high performance. A performance that is backed by a full two-year warranty.

Whether it's high speed printers, plotters, dot matrix, daisy wheel or even laser printers, the AGILE 6287 is the Protocol Converter you can count on.

As for our competition, we'd count on them only when we had trouble sleeping.

Getting control of data base systems

Four critical factors

By Michael Gorman

The data base approach, when fully developed, offers these organizational and technological benefits:

- Systems reflect organizational quality because they are founded on organizational analysis rather than on process analysis.
- Data base design preserves the natural contexts of business events.
- Data bases last a long time: Changes are minimal and have almost no impact on the programs that use data.
- Data base systems offer a wide selection of canned software tools for manipulation of data. Each tool was designed to minimize human effort and maximize overall integrity.
- Data base systems force

Excerpted from the book Managing Data Base: Four Critical Factors *by Michael M. Gorman. Published by QED Information Sciences, Inc., QED Plaza, 170 Linden St., Wellesley, Mass. 02181.*

IN DEPTH

the ownership of data to be escalated from the programmer to the organization.

- Data base systems permit common, multiple-user data processing, with the data base management system (DBMS) protecting the data base from conflicting operations.

The data base approach consists of four components: the logical data base, the physical data base, interrogation and system control.

The logical data base component represents the logical organization of the data base and the activities required to specify, implement and maintain it. The physical data base component represents the physical structure of the data base and the activities that bring it into existence and maintain it. The interrogation component represents the various data base management system (DBMS) data access languages and the activities required to choose the appropriate one for a task. Finally, the system control component represents the types of protections necessary to implement and maintain a data base application.

Each of these parts needs to be understood from four viewpoints: technology, the DBMS, staffing and the data base project.

Data base technology

The technical aspects of data base relate to four major data base components: logical data base, physical data base, interrogation and system control. The organization of a data base is represented by the data definition language (DDL). This same language communicates the data base's organization to the DBMS.

Since every DBMS' logical data base is controlled by a certain set of rules, the totality of the rules that allow network or hierarchical relationships and that bind records through either value-based or information-bearing relationships is called the DBMS' data model.

In general, there are only four major data models. The network data model often is able to define complex records and allows a member record to be owned by multiple records. The hierarchical data model generally defines only simple records and allows a member to be owned by only one owner. For both data models, the relationships that bind records together are information-bearing.

The third data model, the independent logical file, stores complex records, but its mechanism of interrecord relationships is value-based. The fourth data model, relational, stores only simple records and relates them through value-based relationships.

Static and dynamic DBMS

The main reason for distinguishing between information-bearing and value-based relationships is that DBMS, which are the predominant software tool for implementing data bases, are grouped into two major categories: those that are essentially founded on information-bearing relationships and those that are founded on value-based relationships.

Information-bearing relationship DBMS create data bases that are rigorously structured and that allow records to be retrieved and updated only in terms of these relationships. These information-bearing relationship DBMS create a static environment because the locations of the related records are already known.

The value-based relationship DBMS create data bases that allow the specification of relationships at retrieval time. The DBMS decodes the relationship specification and then proceeds to discover whether records exist that participate in this user-specified relationship. These value-based relationship DBMS create a dynamic environment, as the locations of the related records are to be discovered during retrieval.

Because both the network and hierarchical data models are based on information-bearing relationships that create static environments, these two models are generically referred to as static. Further, the DBMS that represent these data models are called static DBMS.

Because the independent logical file and the relational data models are based on value-based relationships that create dynamic environments, these two models are generically referred to as dynamic. The DBMS that represent these data models are called dynamic DBMS.

Knowledge of a DBMS data model is important, but not as important as knowing whether the DBMS creates static or dynamic relationships. If the DBMS relationships are static and the application is dynamic, application failure is almost always the outcome. If, however, the DBMS relationships are dynamic and the application is static, then the application usually is implemented, but the production rates normally fall far below expectations.

Because a data base project is different in important respects from a traditional data processing project, the staffing required to undertake it is also different. Five different types of skilled persons should be represented in a data base administration group.

Data base specialist

A great deal of functional knowledge is required to design a correct and useful data base. Therefore, the data base specialist's expertise would be primarily in the functional area of the data base. For example, if the data base was about contracts accounting and administration, the data base specialist would be expected to be completely knowledgeable in that area. The data base specialist does not design the data base; he remains with and assists the various functional users in designing it.

After the data base is designed, the data base specialist helps develop a complete implementation plan that is realistically founded on a complete conceptual specification.

CW-138

The conceptual specification consists of a complete data base design (the logical base) and a preliminary analysis of the other three components — the physical data base, interrogation and system control."

During implementation, the data base specialist finalizes any data base design details that may not have been addressed during the conceptual design process. Each changed detail that affects policy must be cleared with the functional users.

An important step in the implementation plan is the transformation of the generalized data base design to a specialized design required by the DBMS. The data base derived during the conceptual specification stage is very often a network, so an analysis is required to determine whether the relationships that bind the network of record types together are mainly static or mainly dynamic before the appropriate DBMS that is to be used for data base implementation can be chosen.

Regardless of whether the DBMS is static or dynamic, if the DBMS employed is a hierarchy, an ILF or relational, additional policies regarding integrity must be developed to permit construction of the DBMS version of the data base. These additional constraints need to be formally documented as thoroughly as any of the other data base policies.

If the DBMS relationships are static and the application is dynamic, application failure is almost always the outcome.

The data base specialist must oversee this transformation process and make absolutely sure that none of the policies established by functional area users are compromised.

Interrogation specialist

The role of the interrogation specialist seems almost traditional. This person can utilize any of the standard methods of design on data base subsystems (the data loading, data update and reporting subsystems).

The most critical aspect of the design of either the data loading or the data update subsystems is that the policies utilized must first be designed during the conceptual specification phase of the data base project.

If a policy flaw is discovered during the design or implementation of any aspect of the data base project, be it an omission or a conflict, the interrogation specialist must not fix it. The flaw must be referred to the data base specialist for resolution.

Once the loading and update subsystems have been constructed for a particular data base project, the interrogation specialist assumes the role of a consultant to various users of the data base as they develop and maintain reporting subsystems that come and go during the lifetime of the project. As a consultant, the interrogation specialist helps users select the most appropriate access language and assists them through design, coding, testing and documentation.

System control specialist

The system control specialist's job is probably the most overlooked of the data base jobs. It is, however, one of the most important. The system control specialist is usually involved half time in the beginning of the project, full time during implementation, quarter time during the first six months of operation and then as a consultant. From time to time, significant effort may be required as major changes in the data base become necessary.

The system control specialist must examine the need for audit trails from both the functional and the legal points of view. The legal requirement for audit trails may come from federal laws or from regulations promulgated by such government agencies as the Securities and Exchange Commission, the Environmental Protection Agency and the Nuclear Regulatory Commission.

Once the requirements are determined, audit trail designs must be constructed that are complete in terms of data content, DBMS integrity and throughput performance. The audit trails then must be implemented, tested, debugged and documented. Finally, audit trails must be put into operation and carefully monitored for some time before they can make the transition to a maintenance [illegible]

Backup and recovery is another critical aspect of the system control job. The system control specialist should develop tests that verify that the data base being backed up is in fact good. It would be unfortunate if a critical part of the data base's dictionary was defective and the defective data base was backed up over the last good backup. There can never be too much testing when it comes to verifying data base backups.

Finally, the system control specialist should construct a fail-safe backup process that unloads the data base data from the data base into a permanent, machine-readable source format, unloads the DDL and [illegible] sufficient computer programs to reconstruct the data base from the resultant source data and the DDL.

This fail-safe backup is needed in case all the normal medium backups are unrecoverable. While the alternative medium and the method of restoring this fail-safe backup may not be very efficient, they are certainly better than having to re-collect the data, which may be nearly

ses voice/data integration.

The manufacturer of the first integrated voice/data switching system considers the issues.

Data is a major factor in office communications today. It's projected that within the next five years, data transmission will increase from the present 2% to 40% of total PBX traffic. That's explosive growth. And it means that companies must accommodate this increase by expanding their present systems or by planning now to replace obsolete systems with ones that can meet those needs.

A look at alternatives.

To keep pace with this change, an organization has two basic choices. First, it can stay with a limited voice-only PBX and create separate data networks. This, however, is a costly, inefficient method, and it becomes increasingly difficult to manage multiple expanding systems.

The second alternative is an integrated voice/data system. By installing one network, a company can have voice and data capabilities at every outlet.

Key benefits are the sharing of resources—devices and software—and consolidated network management. An integrated system is an investment in the future that can pay for itself in the savings of single network administration.

A definition of terms.

Integrated voice/data is sometimes thought of as simply combining voice and data in one switch. But it's really much more. It's the total integration of voice and data through a twisted pair network.

Because a digital system does not distinguish between voice and data, both look the same as they pass through the switch. So it's possible to apply sophisticated voice features to data—least cost routing, conference calls between workstations, callbacks on data terminals and other aids to productivity that are normally associated with voice-only systems.

Major considerations.

Universal Connectivity

One of the greatest challenges facing communications professionals today is the management of changing technology. In an environment where many approaches to office communications call for complete flexibility, only a system designed to be compatible with multi-vendor equipment is a safe choice. Such a system provides the format and protocol conversion capabilities for dissimilar devices to communicate with each other, freeing a company from the need to choose all its equipment from one vendor.

A system should be capable of connecting numerous dissimilar devices to a common network, allowing them to share peripherals, data and functions. This flexibile connectivity also protects your investment in equipment, ensuring its continuing value.

Non-Blocking Traffic

In voice systems, many calls can share one path through the switch because conversations are short and not everyone uses his telephone at the same time. However in data communications each device needs full access through the switch, and the long holding times of data calls place heavy demands on a network. As more data circuits are added to meet growing user needs, a system founded on voice-only design can't handle the traffic and begins to block calls from completion, or to degrade the quality of transmission.

Non-blocking matrix architecture, however, places no restrictions on voice and data access. As the data-to-voice proportions change, the system is reconfigured at the host controller. And there's no new cabling required. In non-blocking systems, savings are soon realized in simplified administration.

Processing Capacity and Speed

Many installed systems operate on 16-bit processors. While this may be adequate power for today's voice-only systems with few data options, it may not be sufficient for tomorrow.

Since a system's processors are the limiting factor, they must offer enough capacity for growth. A system offering 32-bit processors can handle both present and future capacity requirements. It's valuable insurance against obsolescence, with unlimited potential for applications like video and future developments.

The office automation industry is introducing more and more devices that operate at speeds up to 10 Mbps. Only an integrated voice/data system that offers 10 Mbps connectivity and integrated local area networking can successfully carry a company into the automated office environment now evolving.

A view for the future.

In 1979 InteCom introduced the first integrated voice/data system, the IBX™ Integrated Business Exchange, and since then has been setting the pace for the office communications industry.

The system has been proving its merits in installations all across the country for more than three years. It's backed by comprehensive support and refined through an ongoing program of research and development. Software-oriented, adaptive to new technology and protected from obsolescence, the IBX offers you the connectivity needed for tomorrow's automated office.

We hope this look at the issues of voice/data integration will be useful to you in your system selection. InteCom has met the communications requirements of companies in a wide range of industries. And today, our representatives are ready to help you evaluate your specialized needs.

impossible anyway if the damage occurs long after the data base has been implemented.

Logical and physical data base reorganization is also critically important. It ensures continued high performance in static applications and allows adjustments and evolutions of the data base to occur. Data bases degrade very subtly, and eventually the applications that use them often stop dead in their tracks.

Carefully planned statistics must be collected and examined to detect the warning signals that demark this passage. Shortly before the data base applications become comatose, data base reorganization must be undertaken.

Finally, the system control specialist must be concerned about data base security and privacy, which are often achieved through a combination of DBMS software capabilities, computer operations, procedures and corporate policy about handling violations.

Documentation role

It should be clear by now that documentation and standards play more than a bit part in the data base drama. In fact, the documentation of a data base project plays such a large role that it must be done first. This is because it contains the rules by which all participants are governed. To attempt the data base approach in developing an application without first having a complete and thorough debugged documentation of the system being developed is like trying to establish a lawful society without a constitution and a body of laws.

The documentation and standards specialist becomes the keeper of the data base project implementation method. As the keeper, this person creates, understands and instructs users on all of its aspects. The keeper must also monitor adherence to the standards. Any changes in standards must be made in a carefully controlled manner.

The importance of this position is widely recognized. However, the role is often restricted to being a DBMS guru To make this role complete, the DBMS specialist must be given a budget to perform detailed experiments to determine, for example, the extent to which data bases perform poorly because of structure degradation resulting from extensive updating or inappropriate designs. All this information should be thoroughly documented and classified for easy recall, analysis and refinement.

The DBMS specialist should be directly involved as a consultant in the development and operation of hot lines and as a key member of an in-house DBMS user group. He should also attend regional or national group meetings for DBMS users.

Finally, the DBMS specialist should be thoroughly knowledgeable about any DBMS bugs that may have been discovered. These bugs should be verified through a standard test data base, referred to the DBMS vendor, and categorized as to severity.

Solving problems

A way to solve the bug or a technique to work around it should then be found. Finally, a bug correction date should be negotiated with the DBMS vendor. Once all this has been done, the user should be informed about progress.

The data base approach to system design is different from a traditional data processing project in six ways:

- At the center of the data base approach are data bases, not reports. A data base should be designed to enhance the orderly process of organizational decision making in some well-bounded area. The data base thus becomes a computer-based model of that business area.
- The data base is designed by users within the

Major changes occur only when the data base has not been correctly designed initially or when there is a fundamental change in the nature of the business.

business. Since they know the organization best, they are uniquely qualified to design the data base. A data base design is not a feat of technology, it is the practice of common sense. In short, if the design does not make common sense, it makes no sense at all.

■ A prototype of the entire data base project should be built during the first phase of the project. With a dynamic DBMS, this task can be accomplished in a few weeks. When this prototype is demonstrated to and employed by the users, necessary design changes become obvious. Since the prototype takes only weeks to create, changes to it take only days. The revised prototype is then demonstrated.

■ Computer-generated reports assume their rightful stature: very low. Only after the data base has been designed and its physical data base and system control components fully implemented is it time to begin work on the interrogation modules (reports).

The traditional system design is today's use of data, whereas the data base approach to system design is focused on the fundamental business policies that dictate data organization and structure. The former is like building a system on a foundation of shifting sands; the latter is like building on time-tested granite.

■ The traditional approach requires the expenditure of about [illegible] of all the money and time allocated for system development before the design can be demonstrated. In contrast, the data base approach enables the creation and validation of a prototype before system implementation.

Thereafter, the system's delivery date can be predicted with confidence for these reasons: The design has already been shown to be correct, and it is left to the user to write all or most of the ongoing interrogation subsystems using any of the DBMS language alternatives.

■ The sixth difference is in system maintenance. The data base is designed from a foundation of organizational knowledge; thus, changes to it are minor. Major changes occur only when the data base has not been correctly designed initially or when there is a fundamental change in the nature of the business. The first can be prevented; the second seldom occurs.

Reports do change, but since they are not a critical part of the data base system, the effect of such changes is not significant. And with the advent of sophisticated natural languages, old reports can be modified easily, and new reports can be constructed in a few hours. In short, maintenance is part of the data base approach to system design; because of this, changes become evolutions of systems, not revolutions.

Static or dynamic relationships usually dominate a

data base application. Seldom is there an application in which the quantity of relationship types is evenly divided. That simply means that applications, too, are typically termed as either static or dynamic.

If the application is static, then the relationships among record types are normally all well-defined, stable and seldom change. Static applications also tend to be product-oriented, with large volumes and high velocities. The principal access languages for static applications are Cobol and Fortran.

A dynamic application, in contrast, tends to have relationships that change almost as often as the data. The orientation of the application is MIS. These applications often seem to have less data, lower volumes and lower velocities than the static applications. Natural languages dominate the dynamic application.

A dynamic DBMS' DDL usually does not contain formally defined relationship clauses with all the attendant integrity, record storage and retrieval subclauses. Record instances are stored in the record types in the order presented and are maintained in any order or stored and maintained in the order of the record's primary key.

The user of a dynamic data base has sort clauses as a fundamental part of the language. Records are thus selected and sorted before presentation. Once presented, the records should be able to be resorted and presented again. Actually, the records are not sorted; their address pointers are.

The effect of having a dynamically related set of records is the inverse of the effect of having a statically related set of records. Each interrogation has an equal chance of retrieval and update efficiency. There is no bias to the processing. Often, there are no restrictive relationship integrity clauses. That burden is placed on the user simply because it is the nature of the dynamic data base to have the rules for record interrelationships undefined. Thus, it must follow that the integrity clauses governing the interrelationships must also be undefined.

Project phases

The data base project is completed in three main phases. The first phase, conceptual specification, consists of activities in each of the four data base parts: logical, physical, interrogation and system control. In the logical data base component, the rules that define the data base's integrity are developed. This collection of rules is called the data integrity model.

In the physical data base, the rules that define acceptable data transformations are completely specified. This collection of rules is called the data transformation model. Also addressed, but in a minor way, is the remainder of the physical data base, interrogation and system control. At the end of this phase, the data base is designed, and the remainder of the project is in conceptual specification form.

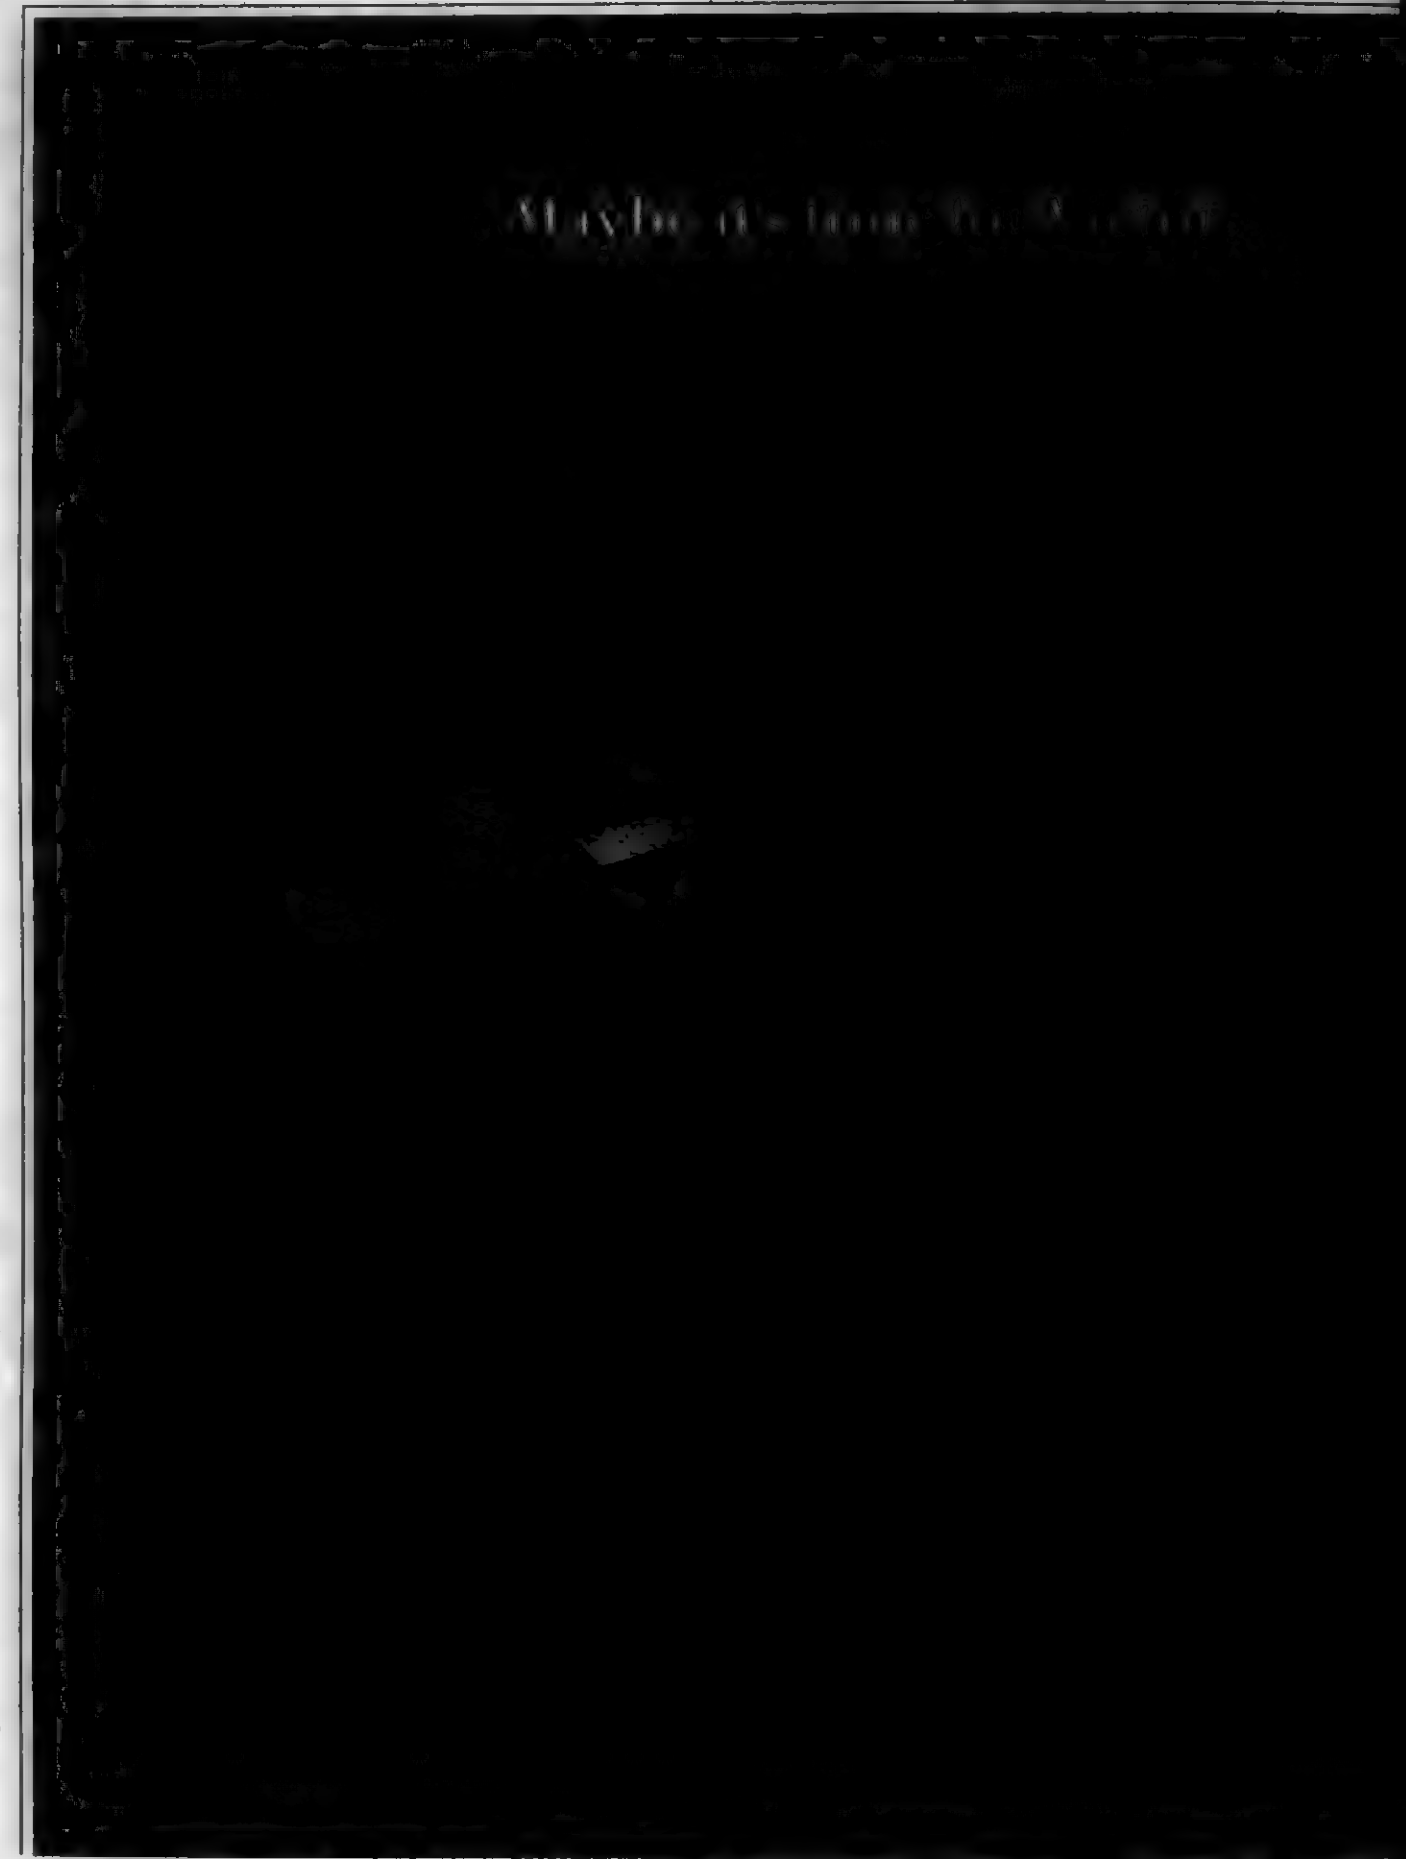
The amount of work required in the conceptual specification phase is considerable. This is true for all data base projects, regardless of the DBMS employed. It should never be supposed that this work is not needed when the project is intending to use a dynamic DBMS rather than a static one, because these activities are even more important with a dynamic DBMS.

Most dynamic DBMS offer interrecord integrity only through user-written programs, rather than centrally through schemata. This means that all the data integrity rules and the data transformation rules must be specified correctly and without variance in all programs. That's a lot of work.

The second major phase, implementation, concentrates on transforming the conceptual specifications into computer code and procedures, both manual and automated, to load and update the data base and to protect it through system control capabilities.

Once completed, the data base becomes operational. Interrogation is purposely downplayed because it is not a critical part of data base. The data integrity model is transformed into the schema DDL and data integrity procedures that reside in the schema or update programs. The data transformation model becomes the major portion of the loading and data update subsystems.

The third major phase,



production and administration, is ongoing — that is, it is concerned with the actual operation and administration of the data base environment. The activities in this phase are first directed to the development of data base interrogation subsystems and then toward performance optimization, design evolution and maintenance of the four data base components.

One thing should be very clear by now: The data base approach is not a computer science — it is a management science. It just so happens that the computer is a good vehicle for implementing data base projects, and that instead of expending hundreds of man-years on specialized software development, organizations can make use of a generalized solution, the DBMS, in conducting a broad range of information management activities.

Not only are data base projects a big effort, they are also performed at considerable risk. This risk can be both managed and minimized, however.

Reducing waste

The data base project methodology presented above describes practical ways to reduce waste or redundancy in the use of project manpower. Selecting the right staff, getting the staff trained and using the right DBMS is also critical.

Six additional factors bear heavily on the accomplishment of the elusive goal, success:

- Application risk.
- Management assistance.
- Documentation.
- Consistency.
- Definable policy.
- Policy coherence.

Knowing when not to do something is important — especially in data base applications. Not all applications are ready for the data base approach. To attempt an implementation prematurely will very likely result in failure.

Management must remember that a data base is in essence a treaty that binds all of its users. An organization must be ready for data base before it can be successfully implemented.

Management must first understand what a data base really is and, second, understand that if the organization is not correctly postured, data base should not be tried. The exercise of creating the conceptual specification produces a valuable result in its own right: It is a statement of just what part of data base is actually possible. The real commitment to data base, that is, the really significant expenditure of money and time, does not come until the implementation phase.

Even if a data base application is not implemented immediately or ever, the conceptual specification reveals the depth and breadth of agreement in corporate traditions and organizations as seen through the harsh realities of operational policies. A concrete expression of that kind of reality is rare — and of incalculable value.

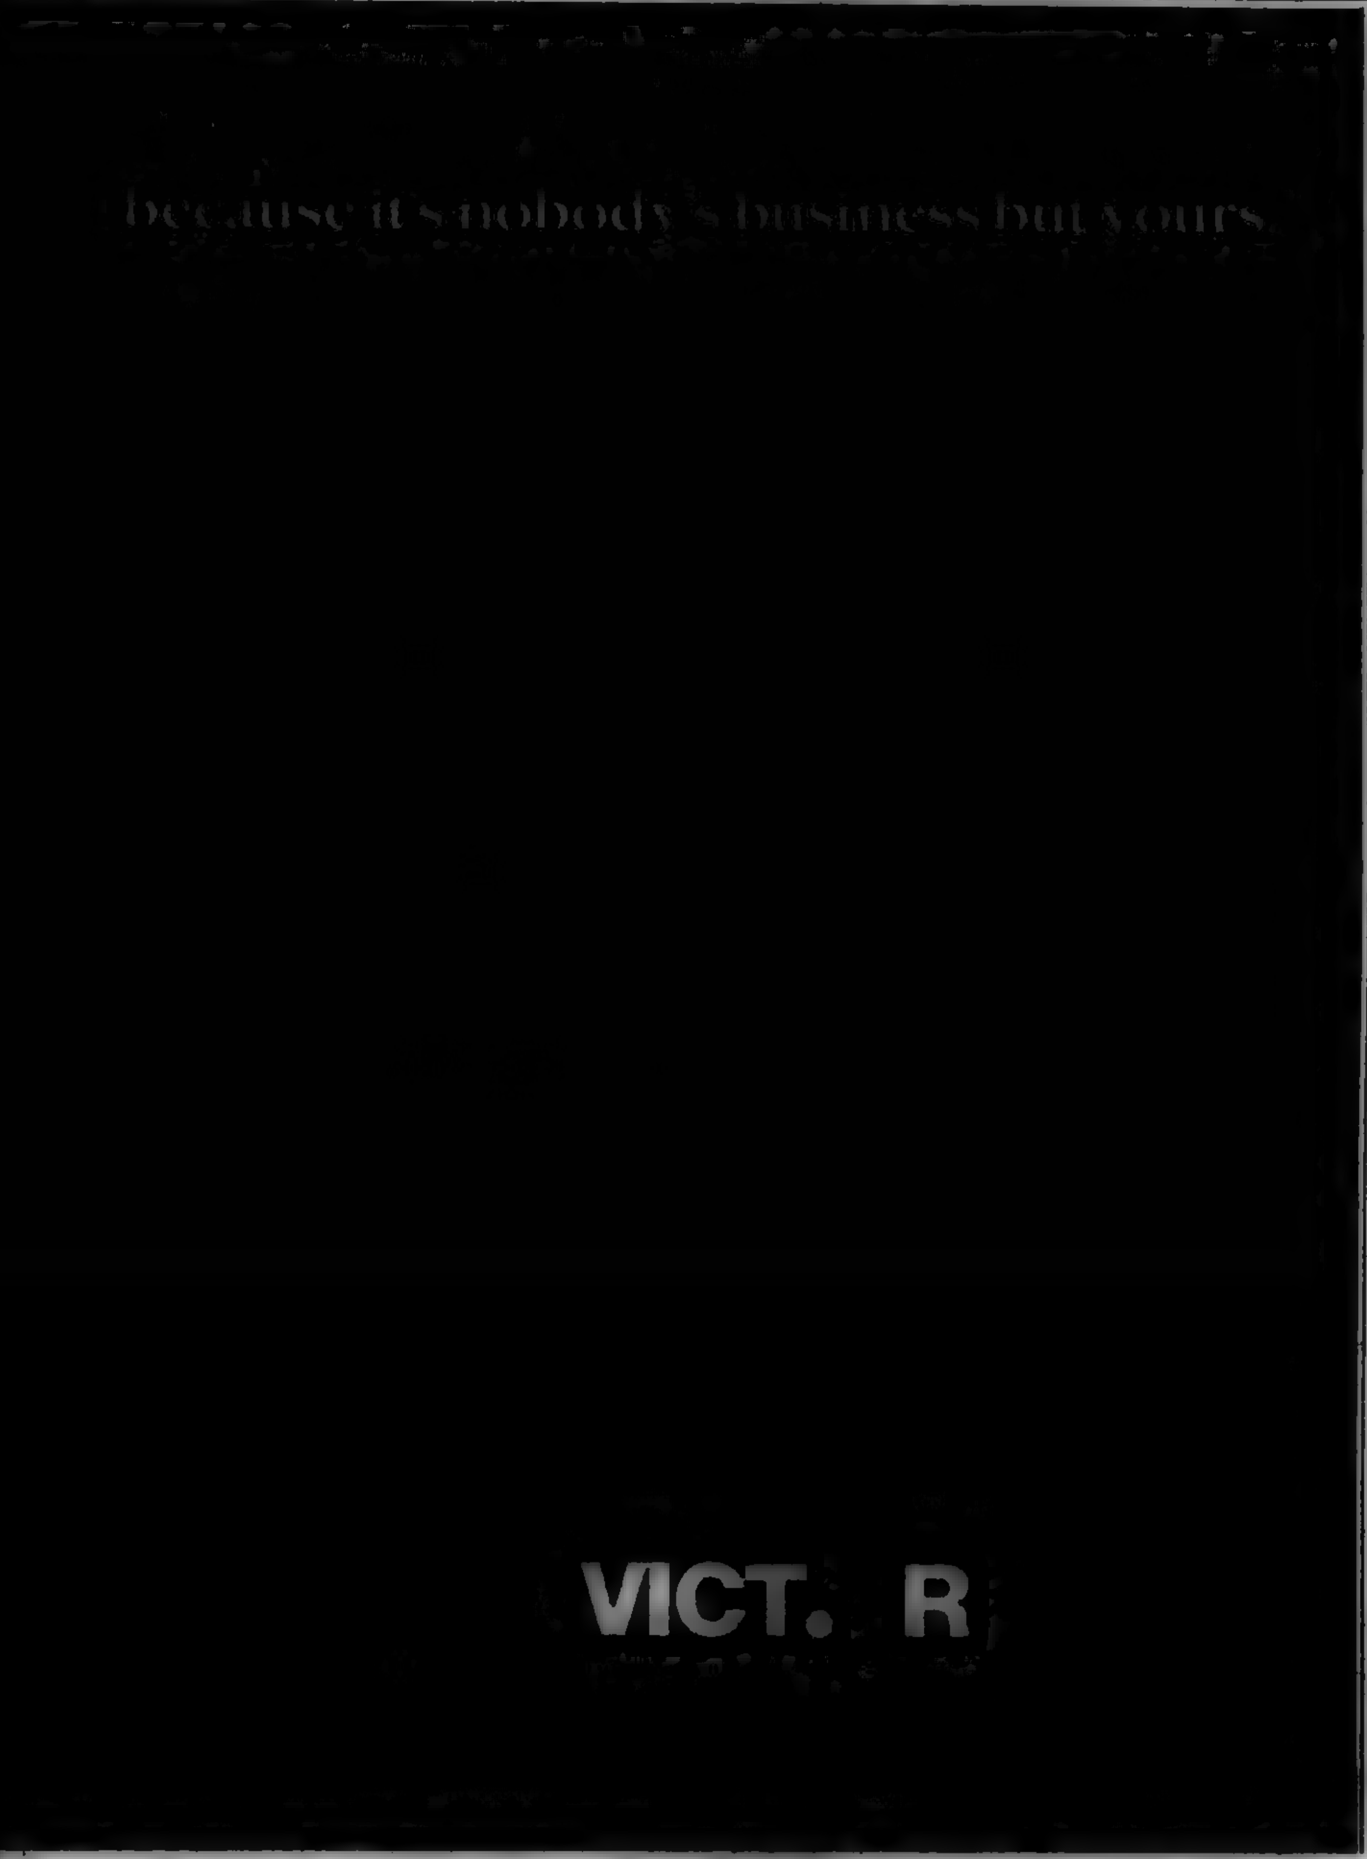
The two ways in which management can really help are to support the establishment of realistic schedules and provide the long-term commitment needed to bring about some measure of success.

It must be remembered that the development of the data base project's conceptual specification is the codification of good management practice — and that could well take several iterations to accomplish, with one or two unexpected discoveries along the way.

Plan for consistency

If there is not a careful plan for consistency, the only thing data base will have accomplished — looking back 10 years from now — will be to have replaced the file (a simple technology data store) with a data base (a complex technology data store) and the program with the nonprocedural language program. There will still be the same lack of conformity and relatability, only this time, the lack of conformity and relatability will be more rampant in the organization; be more damaging to the organization's ability to forecast changes correctly and be more difficult to correct.

Consistency applies to almost every aspect of data base. It must be present during the conceptual specification phase while policy is built, while the prototype is built, and finally, it must be considered when the initial selection of the DBMS is made. In the implementation phase, consistency must apply to the incorporation of policy into each of the data



PRESENTING THE LATEST ADVANCES IN ARCHITECTURAL DESIGN.

Rising above the main campus at the University of Pittsburgh stands a Gothic tower called the Cathedral of Learning. Its exterior owes much to medieval architecture. Yet within its walls, you'll find another kind of architecture—one that's thoroughly modern. It's called Information Systems Architecture, the design principle governing the new technologies from AT&T Information Systems.

VOICE, VIDEO AND DATA FULLY INTEGRATED IN ONE SYSTEM

The University of Pittsburgh wanted a total solution to their information and communication needs. AT&T could provide it. We offered a system that fully integrates not just voice and data, but video functions as well.

It's all made possible with Information Systems Architecture, the unifying principle designed into every product we make and tying all our systems together. The reasoning behind it can be summed up in three words: communication, distribution and uniformity.

INFORMATION SYSTEMS ARCHITECTURE: THE PRINCIPLE

Communication

Because all AT&T products are communications based, they can communicate efficiently and effectively with each other and also with products made by other manufacturers like those of DEC and Xerox already being used at Pittsburgh.

Besides being great communicators, they're also great translators. So products from different manufacturers that are otherwise incompatible can communicate with each other, using our equipment as a go-between. In this way, Information Systems Architecture protects both your past and future automation investments.

What's more, the system is functionally integrated, so various applications, such as Electronic Document Communication and Message Center, can work together and share information.

Distribution

Besides functional integration, we also provide function distribution. This allows applications to be distributed to whichever system component is most appropriate and cost-effective. Even to components in different locations, miles away from each other.

And all end-users, no matter where they are, or to which component they are hooked up, still have access to all functions in the system.

Uniformity

All our products are designed to be user-friendly, so they're easy to use. But beyond that, we've also made their operation uniform. A person trained in one location on one type of terminal will have no problem operating a different type of terminal located somewhere else. This keeps training costs down and your operation running smoothly.

With communication, distribution and uniformity as our watchwords, Information Systems Architecture guarantees an evolutionary system—one that can keep up with changing needs and changing technologies. That's why the University of Pittsburgh will always be a campus of the future, no matter what the future may hold.

THE TRADITION OF EXCELLENCE CONTINUES

The University of Pittsburgh, a distinguished academic leader for nearly 200 years, has called upon AT&T's century of communications experience to help them carry on their tradition. They're in good hands. Four thousand designers and engineers formerly at AT&T Bell Laboratories are now working exclusively to develop new business products at Information Systems Laboratories. Information Systems Architecture will give them the framework by which to tie those products into complete business automation systems.

It will provide our sales staff with a planning tool for total automation so that all needs are met, now and in the future.

And, because of our uniform design, the job of the largest, most experienced service staff in the industry will be that much easier.

To find out now how AT&T Information Systems Architecture can put you on the road to total office automation, call 1-800-247-1212, Ext. 198.

IN DEPTH/DATA BASE SYSTEMS

> ***Management must remember that a data base is in essence a treaty that binds all of its users. An organization must be ready for data base before it can be successfully implemented.***

update programs or in the automatic DBMS procedures. It must be especially prominent in all the system control components, so that the data base is well protected and preserved.

Finally, in the production and administration phase, consistency must be the keystone of the metabase. It permits the efficient search for, and identification of, just the modules that have to be changed. In short, consistency is essential for effective data base usage.

A policy is a precise statement of what goes on in an organization. Fuzzy policies are the source of many arguments. In the data base approach, there must be policies for everything. They must exist for all record types, all data elements, all data integrity rules and all data transformations. These rules must be defined publicly, reviewed publicly and approved publicly.

Management issue

Defining policy is a management issue, because if management does not initiate consistent policies, maybe the programmers will have to, or the ad hoc users, or the data input clerks. To be sure, all policy decisions will be made. The only question is whether they will be made according to a universally applied corporate policy. If no formal policy has been created and turned into automatically executing computer code, then there will never be any long-lasting data base integrity.

Policy coherence is the effective articulation and coordination of management decisions within an organization. There must be policy agreement within a community of data base users about the boundaries that demark different policy areas.

Determining these limits is critically important, as they are the maximum boundaries of the data base. For example, if agreement is not possible on the data values for the sex element, then it must not be included in the data base, because different users are sure to update and retrieve personnel on the basis of these unreliable element values.

The successful implementation of a data base system requires careful attention to its four aspects: technology, staff, the project and DBMS. In each of these four areas, the same four topics were addressed: logical, physical, interrogation and system control, so that a cross-reference of information can be achieved.

As stated at the outset, the data base approach has been developed to the point that the complicated technology on which it is based does not show any longer — or shouldn't. As a result, data base's real face, that of a management challenge, cannot be avoided.

Careful planning is critical. Do not move too fast. Do use prototypes. Recognize that static and dynamic DBMS are different and that you cannot use one for the other's applications. Finally, remember that since data base can only mirror organizational quality, it cannot be used to effect an organizational cure.

Techniques that enable organizations to operate efficiently must already have been implemented before a data base project is attempted. If a corporation is not efficiently organized, data base is simply not possible. To have data base is to be organized.

IN DEPTH

A strategy for success with office systems software

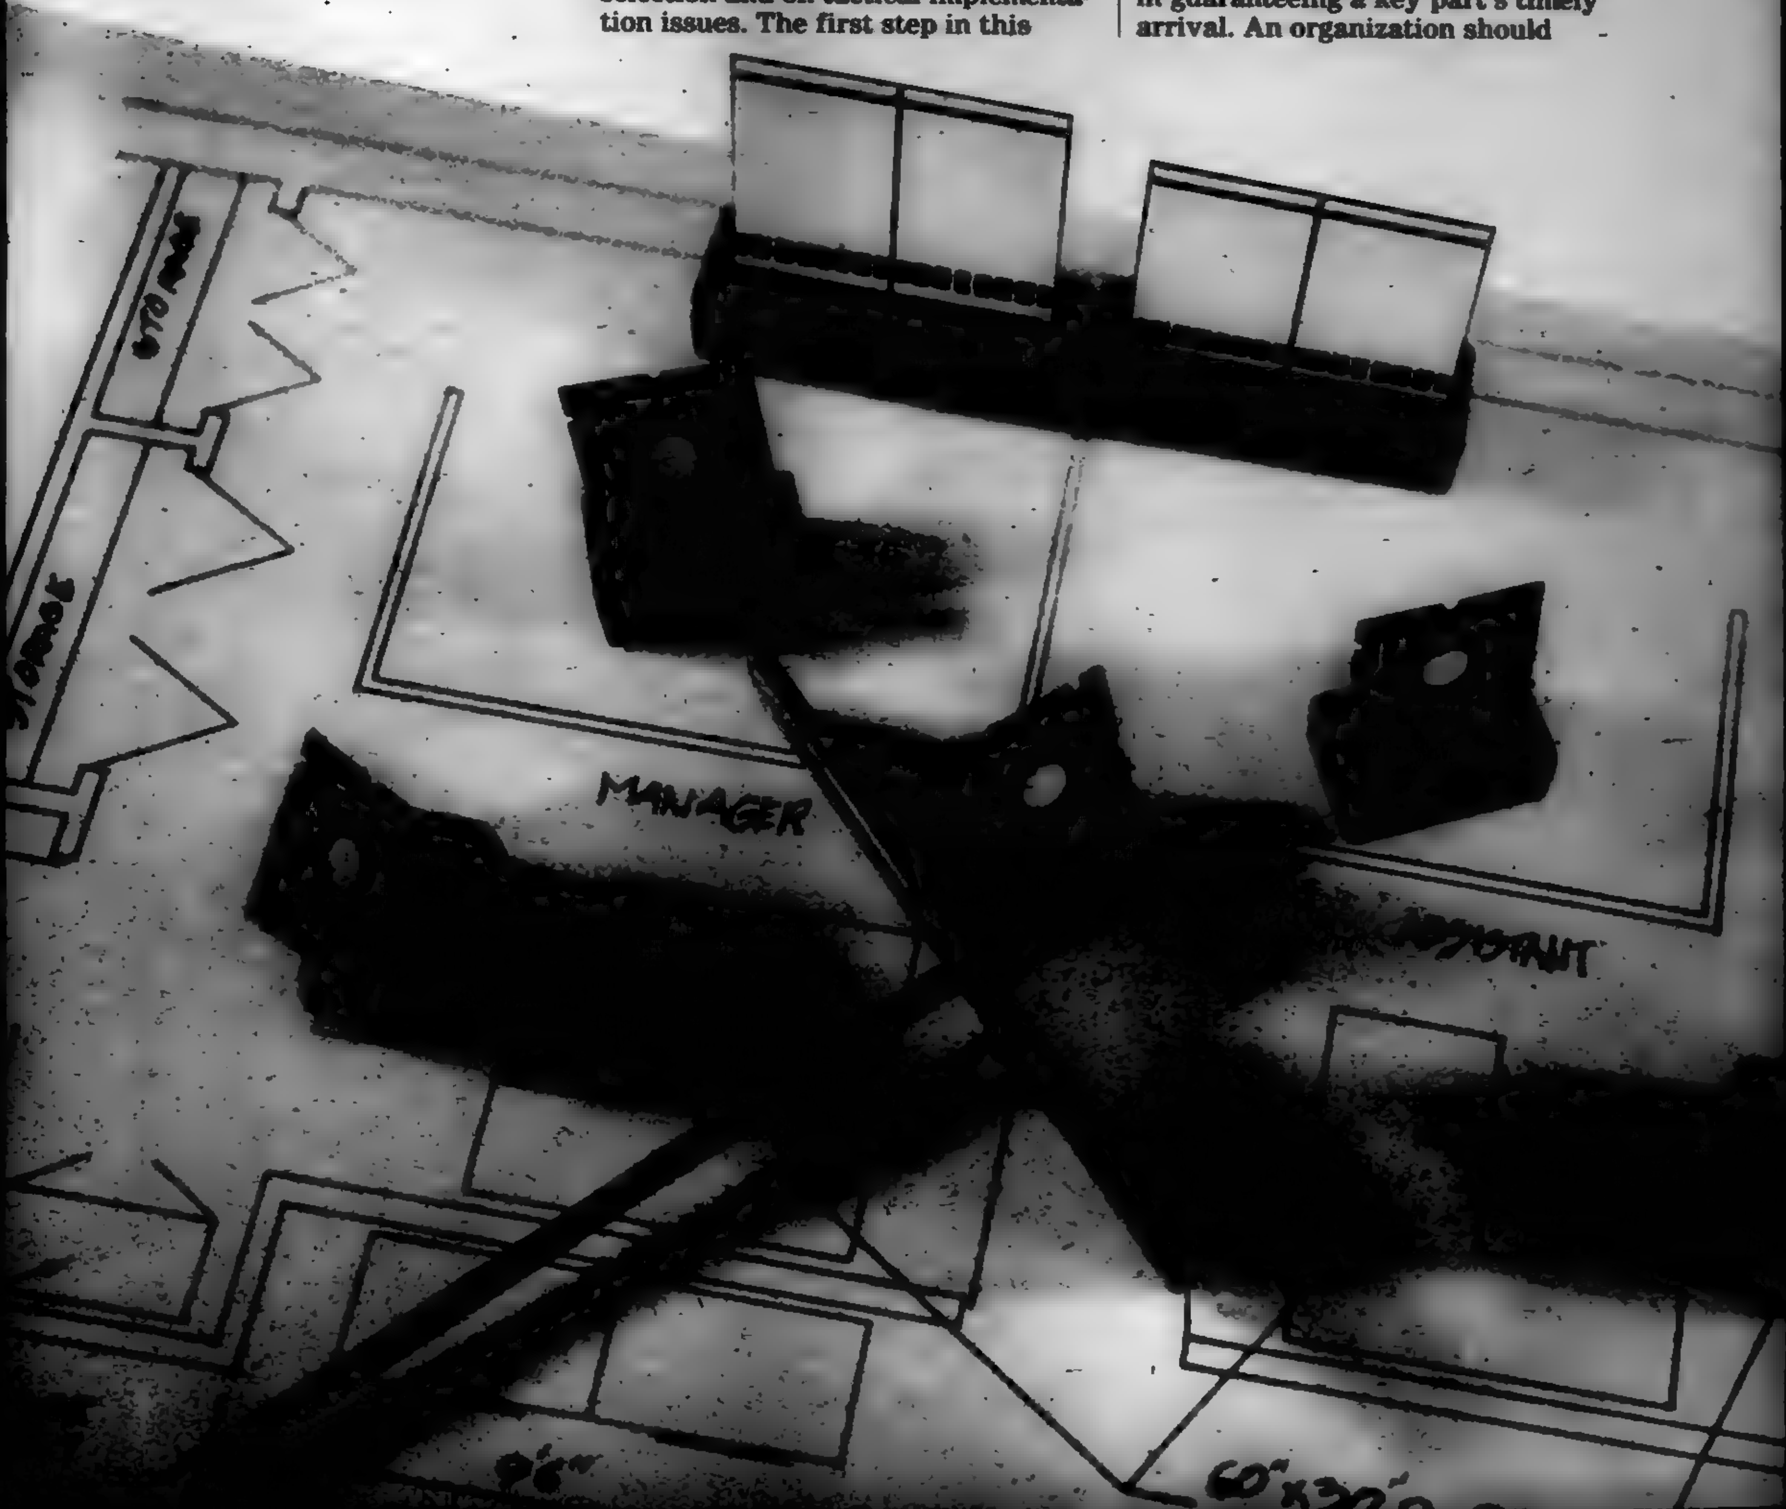
By Thomas Hill

A software strategy should target measurable productivity goals and tie them to specific product features.

The personal computer software industry is growing 50% to 70% a year; for each software house that goes out of business, another two spring up to take its place. These software firms are introducing thousands of software packages each year and creating real problems for users purchasing software for the office.

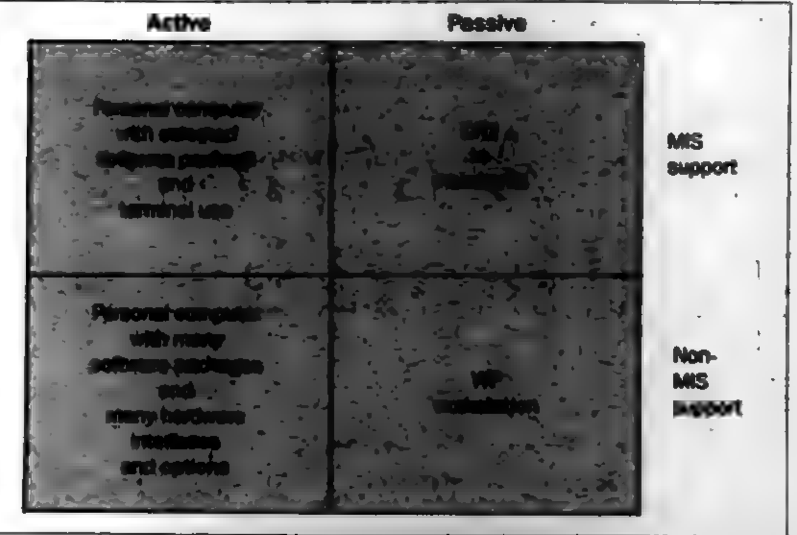
To make the odds work in its favor, a company should focus its software strategy both on criteria for software selection and on tactical implementation issues. The first step in this strategy is to identify the critical business factors in the organization, because the software a company buys must meet its goals and objectives.

Some businesses, by nature, have key sets of critical business factors that must be met if the organizations are to meet their goals. In the distribution business, for example, having goods arrive at a manufacturer's site on time is crucial for optimal production. In this instance, a system of electronic mail between the supplier and the manufacturer may be helpful in guaranteeing a key part's timely arrival. An organization should



Active	Passive
Hard-driving (control) — analytical	Expressive or amiable (may be analytical)
First with new technology	Wants security first
High need to control	Control is secondary
Technologically competent	Low level of technological literacy
Technical degree	Nontechnical degree
25 to 40 years old	35 to 55 years old
College computer experience	Little or no college computer experience
Uses personal computer constantly	Uses personal computer infrequently, at best
Results through constant learning	Results without a lot of training
Creative — technology	Standards — key
Integration not crucial	Integration is key

Figure 1. Active, passive users of personal computers compared



Active

Non-MIS support

Figure 2. OA technology applications by user

carefully examine the critical business factors for success in its business. It should then establish a set of corporate objectives with these factors in mind.

After a corporation matches its objectives to critical business factors, it should then link those corporate objectives to its office automation objectives. In this phase, an organization should be asking two important questions: How can the corporation use its information assets to meet corporate goals? Can information be used to competitive advantage?

> *"Active" users are primarily interested in being creative with the technology.*

In the period when OA objectives are being established, users should be brought into the process. This provides feedback on the real problems the corporation faces in optimizing its information systems — after all, the users are the people who will make the system succeed. It is also important at this point to set a measurable objective, so that after the system is installed, it will be clear whether that objective was met.

Users in the office

Distinct user types emerge in the office environment. Often, in the literature, users are sorted into categories according to their titles. It is more useful to take a different perspective — grouping them according to the extent to which they are comfortable with the technology and the extent of MIS support in the organization.

The introduction of technology into the office has resulted in two basic responses, active and passive, with variations in between the two extremes (see Figure 1).

The active user is one who probably has had experience with computers in college, has a technical degree and is between 25 and 40 years old. The majority of this group are men. Their primary interest is not in the data but in being creative with the technology.

The active user would like to try the latest personal computer-software package available; he would

Realia COBOL.
Migration without migraines.

Until recently, you had to abandon the business computer language when you developed microcomputer application software. The available micro COBOLs were inadequate—too limited, too slow. The best alternative—the XT/370 or AT/370 using IBM's COBOL—was very expensive and still too slow. To get acceptable performance, you had to retrain your programmers in Pascal or C.

Realia COBOL is the cure for such headaches.

Realia's compiler supports most IBM VS/COBOL and VS/COBOL II features, such as:

- COMP and COMP-3 data
- SELECT assignment names
- Multiple entry points
- GOBACK, EJECT, and SKIP statements
- Structured programming extensions of VS/COBOL II

You can download mainframe systems for development, maintenance, and testing. Productivity will soar.

You can compile faster with Realia COBOL than in most mainframe environments, even on floppy-based systems. Compile-time options allow cross-reference, brief and full code listings, and helpful features like subscript and decimal value checks.

Our interactive debugger lets you follow the program source, display and modify data, and set breakpoints using the normal optimized machine code.

The results are startling.

Our users report that their systems run up to 20 times faster when compiled by Realia COBOL. That's compared to our nearest micro competitor. The ratio is up to 100 times faster when compared to any of the others.

On the IBM PC AT, your programs can run at 370/148 to 370/158 speed. Realia's file system really makes your machine deliver, giving it a distinct edge over Pascal or C. Our indexed file system even has full key compression and buffer controls just like VSAM. The generated code is pure MS-DOS, so it can be run on most of the 8088/8086 machine family.

And you can sell your programs without paying us a royalty fee.

Realia COBOL is priced at $995, including one year of maintenance and upgrades. Subsequent maintenance and upgrade contracts are currently priced at $125/year/copy. Available for the IBM PC: PC XT, 3270 PC, PC AT, PC-compatibles, and the TANDY 2000.

Realia COBOL. What a relief.

IBM, IBM PC, PC XT, 3270 PC, XT/370, PC AT, and AT/370 are registered trademarks of International Business Machines Corporation. MS-DOS is a registered trademark of Microsoft Corporation.

like to have an interface card that keeps track of the number of microseconds on the terminal and any other piece of technology available. This type of user achieves results through constant learning of a new technology. Standards are not crucial to this user.

Passive user

The passive user is generally older than the active user and is not nearly so comfortable with the technology. This user probably did not have exposure to computer technology in college and does not have a technical degree.

The passive user is interested in obtaining the same results as the active user but does not want to be a technological genius to get the results. Data security is important to these users, and their approach to working with the system is to be creative with the data. They would like to do "what if" projections, ad hoc query of the data or put together integrated text and graphics presentations with individual style.

As mentioned above, user types can also be categorized according to the degree of MIS support. Figure 2 outlines the technological applications by user type in regard to MIS support. Note that the MIS-supported user can be either active or passive.

The MIS-supported active user follows the guidelines of the MIS organization. This user purchases his personal computer from an approved vendor list and may be connected to the MIS system via a modem or direct-connect line.

He is still using the system to the ultimate and can be expected to drive MIS to add new packages or interface cards that offer enhanced functionality. He may be using his personal computer in a terminal-emulation mode to the mainframe or departmental system. He could be on a local-area network to a data base server or network server.

This user's needs for OA software are far different from those of other users. Possible requirements are the integration of applications software with electronic mail functions and sophisticated integration of communications functions with departmental systems and peripherals in the work group.

MIS-supported passive users are very secure using a terminal connected to the mainframe or division system. They do not want to be concerned with file management or backup of diskettes. They need to have the mainframe data, but they do not want to become the technological gurus of the company to figure out how to get it down to their personal computers.

Suggested software requirements for these users are more sophisticated user interfaces to use the mainframe data (Software Arts' Visicalc on a mainframe) and easier links between graphics programs and data base programs.

Technology gurus

Active users not supported by MIS are the technology gurus of the office. They have the latest in software packages, but the software is poorly integrated. They may be able to create compound documents (integrated graphics, text, data and maybe even voice), but they cannot send them to anyone else. Their energy is focused almost entirely on the technology, not on getting results in the most effective and inexpensive way.

> ***Active users not supported by MIS are the technology gurus of the office. They have the latest in software packages, but the software is poorly integrated.***

Their possible software needs include access to sophisticated integrated OA packages packed full with functionality and features as well as high-level software for programming on their personal computers — for example, a C language compiler — and programming utility software.

Passive users not supported by MIS are probably using stand-alone systems — for example, word processors. The system is not linked to the MIS mainframe or division system.

This user enjoys the sophisticated interfaces available and yet would like to get to the data on the mainframe and have access to the functions and features of personal computer software.

Software requirements suggested for these users are communications transfer programs to link their WP system to the mainframe system and an ability to send documents created in their work group out to other groups via electronic mail. Also on their list would be access to integrated software packages on the personal computer for sophisticated workstation interfaces and local network capability to use peripherals.

A software strategy should take into account the needs of these different users. An organization may want to identify other types of users in order to integrate their needs into a long-range plan for success. The software and office systems architecture should offer the greatest level of flexibility and connectivity in order to support chosen work styles; a user knows the work style that is optimal for his performance.

Productivity goals

The Omni Group Ltd. of New York developed the Software Productivity Identifier (see Figure 3 on ID/14) to

Alamo rents fine Ge [illegible] like the Olds Cutlass Ciera Brougham.

The American Express Card. Don't leave home without it.®

A Great Business Combination: Alamo Rent A Car And The American Express Card.

Alamo's Corporate Rate Program and the American Express Card are tailor-made for business. Both work together to ease and simplify business travel.

Chevy Chevette	$19 a day
Chevy Cavalier	$21 a day
Chevy Camaro	$23 a day
Olds Cutlass Ciera Brougham	$25 a day
Buick Riviera	$29 a day

The American Express Card is the convenient way to pay for hotels, plane tickets, dining, shopping and, of course, Alamo car rentals. And the Card simplifies business record-keeping because you get a written record of all your charges on your monthly statement.

This Corporate Rate Program gives you fine fully-equipped General Motors cars at Alamo's surprisingly low *guaranteed* rates. And Alamo's low rates are available nationwide. Alamo guarantees these rates through June of 1985.

See your Travel Consultant or call Alamo at 800-732-3232 for more information on Alamo's Corporate Rate Program. And if you don't already have the American Express Card, call toll-free for an application at 800-528-8000.

Alamo Rent A Car

Drive an easy bargain.™ Alamo.

Similar cars may be substituted. One-way drop charges may apply. Gas, tax, rental deposit, optional Collision Damage Waiver and Personal Accident Insurance are extra. 24-hour advance reservations required. $1000 deductible is included should the Collision Damage Waiver be declined.

Activity	Applicable Software	Quality	Accessibility	Timeliness	Accuracy	Cost-Effectiveness
Text processing	• Word processing • Electronic dictionary	• Letter-quality printing • Integrated text, graphics	• Help • Computer-aided training • Easy-to-use software for short documents	• Draft printing • Laser instruction • Distributed text processing • Stored formats and phrases • Boilerplate	• Spelling check • Dictionary • Easy corrections printing	• Shared printers, peripherals • Compatibility between workstations • Shared files
Data analysis	• Electronic spreadsheet • Graphics	• Programmability • High-resolution graphics display • Multicolored graphics output	• On-line instruction and Help • On-line demos and examples • Menu-driven	• Instant automatic recalculation • Multiple option viewing	• On-screen editing • Variable decimal place display	• Shared resources • Integrated data base and WP
Communications	• Electronic mail • Public data base access • Local-area networking • Telex	• Mail progress tracking • WP integration	• Simple, menu-driven user access • Broad range of compatible terminals	• Auto forward of electronic mail • Auto answer • Instant delivery	• On-screen editing	• Shared resources
Administrative management	• Electronic calendar • Time management • Project management	• File by date • Hard-copy output • Increased span of control	• On-line staff and project schedules • Daily, weekly, and monthly displays	• Recalculate project plans • Label searching	• Appointment clash detection • Free time display	• Shared resources • Integrated electronic mail
Data processing	• Data base management • Accounting software • Inventory management program • Electronic filing	• Large capacity • High throughput • Integrated with office applications	• On-line instruction and Help • On-line demos and examples	• Search • Sort • Interactive capabilities • Report generation on-line	• Multiple field sorting • Layered indexing	• Integrated graphics, WP and electronic mail

Multiply Management Power —

with MAPPS.

Let us show you how!!

MAPPS (Management And Project Planning System) enables you to:

- SIMPLIFY. Reduce a large, complex project to a model that you can manipulate. MAPPS has a cut-and-paste option that won't multiply complexity. (Or, worse, logic errors.)
- BE REALISTIC. TAILS™, the unique time processing feature, avoids artificial relationships between activities. (Realism makes using the tool worthwhile.)
- TAKE CHARGE. MAPPS was specifically designed to allow the executive or manager to control Time, Cost and Resources. (What else is there?)
- BE YOUR OWN DATA PROCESSOR. MAPPS lists and explains choices on a series of menus. Some require only a yes or no answer. Furthermore, the versatile Select-Sort-Report system lets you tailor reports to meet your needs. (Paper seems to multiply enough. Do your part to reduce excess paper with well focused reports.)
- BE FLEXIBLE. Use any currency in the world. Or specify your work week for any activity beginning on any day of the week.
- ANTICIPATE. Perform "what if?" experiments on the network model to see results without actually committing resources. (Our Project Simulator opens new possibilities for the manager.)
- HAVE A CHOICE. MAPPS operates on Data General MV*, Digital VAX*, Wang VS* and computers using UNIX* operating system.

* Registered Trademarks for Bell Laboratories, Data General, Digital Equipment Corporation and Wang Laboratories.

The Asian Computerworld reaches the fastest growing computer market in the world.

Introducing *The Asian Computerworld*

The Asian Computerworld is *Computerworld's* sister publication covering the South East Asian marketplace. The English fortnightly tabloid keeps company executives, computer users, potential users and people in the computer industry up-to-date.

South East Asia is considered the fastest growing computer market in the world with a total value of $1.8 billion and annual growth rates for small business systems and micros over 50%. The average annual growth rate is approximately 30%.

The Asian Computerworld, with a total circulation of 10,000, is published in Singapore and printed every alternate Monday. Distribution of the newspaper covers Brunei, Hong Kong, Singapore, the Philippines, Malaysia, Indonesia and Thailand.

CW International Marketing Services makes it easy for you to advertise in countries all around the computer world. For more information on *The Asian Computerworld*, just fill out and return the coupon below.

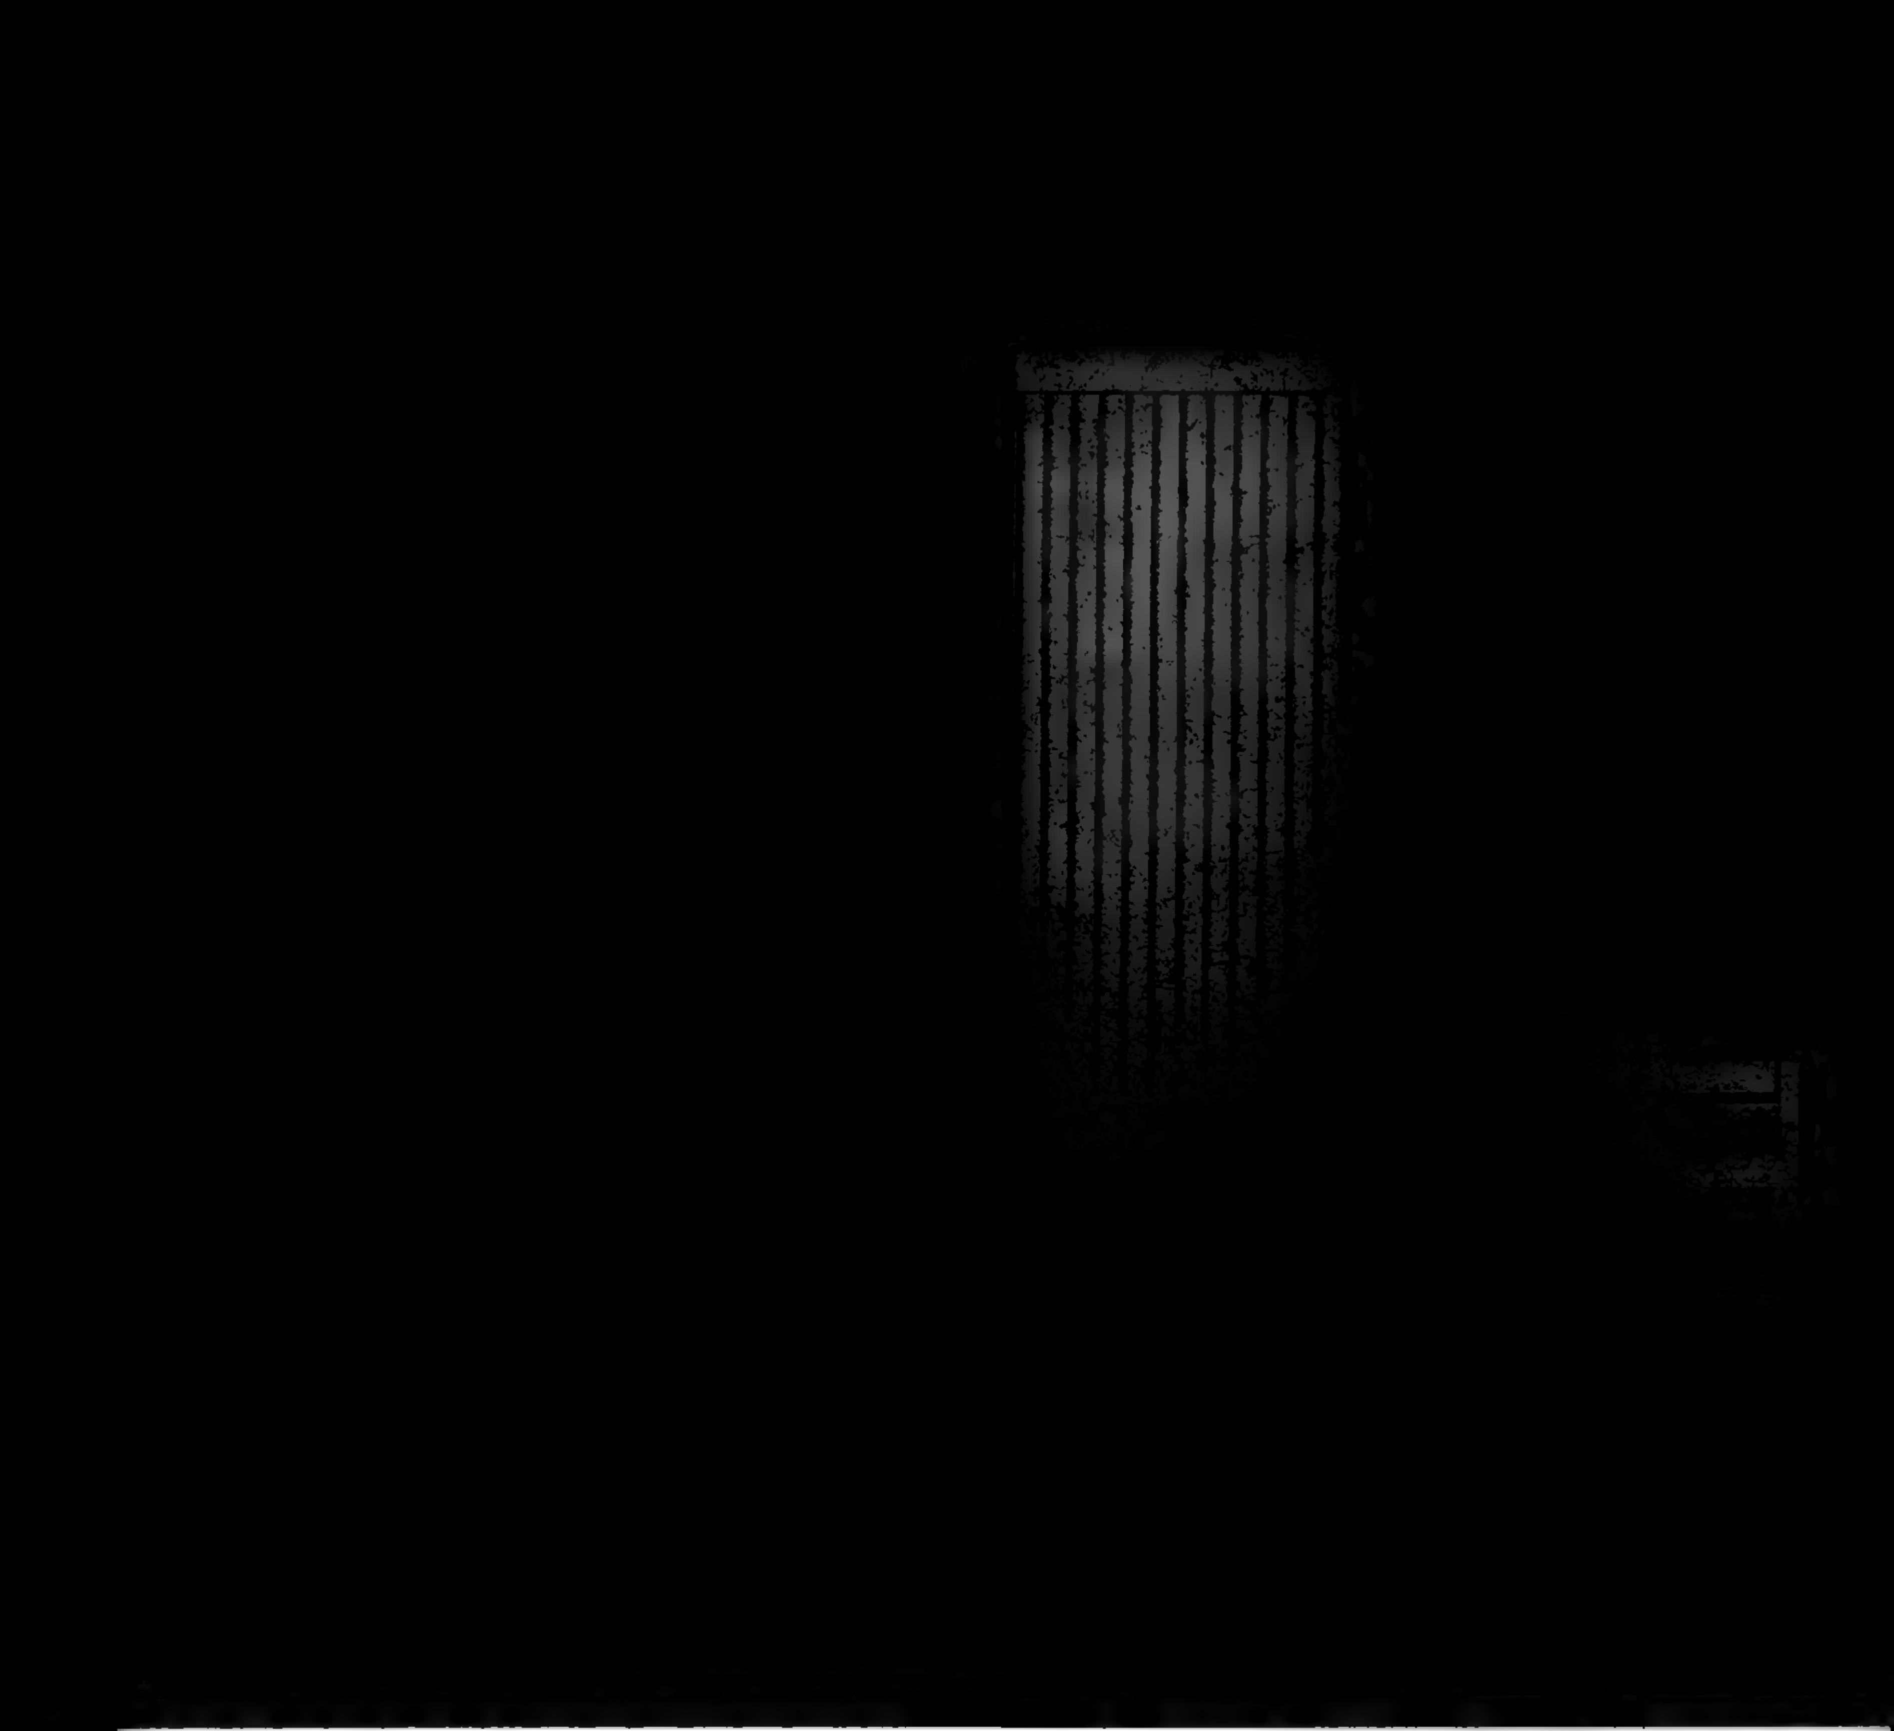
Introducing the TeleVideo Personal Mini.
The growth path for everyone.



Size us up.

We solve tomorrow's computer problems today. EVERYWARE™ systems from Perkin-Elmer.

With so much at stake, your doubts about choosing the right computer system are well-founded. That's why you should take a look at the one family of computers that without a doubt offers everything you've been looking for: EVERYWARE systems from Perkin-Elmer.

The EVERYWARE family embodies a comprehensive merging of the world's major hardware, software and communication standards. A solution for virtually every computing need. Ready to grow with you, while protecting your software investment and data integrity every step of the way.

A Comprehensive Family.

We offer one of the broadest choices of mutually-compatible professional micro and supermini computers, easily integrated and supplemented as your processing needs change. Our Series 3200 32-bit superminis span a complete spectrum of computing capabilities with outstanding performance. . .from the compact, economical 3205 to the incredibly fast and powerful 3200 MPS. And all points in between.

The newest member of our family is the advanced, M68000-based 7350 super micro, bringing EVERYWARE systems to your desktop. With vivid color graphics. Windowing convenience. And

a choice of off-the-shelf applications software–including word processing, spread sheets, graphics packages and development tools.

Operating Environment Flexibility.
Only EVERYWARE systems offer such diverse operating environment alternatives. Real-time processing under our proprietary OS/32 operating system. Reliance PLUS, our proven on-line relational DBMS that enables powerful, user-friendly transaction processing. The Resilient System,™ a new concept in fault tolerance that offers the high-availability advantages of two real-time, on-line processors while assuring 99+% uptime. Or time sharing. Or batch processing. Work in the environment that suits your needs. Or run any-combination of them simultaneously through one powerful system!

To protect your single most important investment–the software–EVERYWARE computers offer a common operating environment derived from world-standard UNIX* software. Via FORTRAN and C, it's bridged to our OS/32 real-time operating system. That's the best of both worlds. And results in true software portability, from system to system, environment to environment.

Communications Everywhere.
We can share information with IBM environments via SNA and BSC emulators. Form a local network using Ethernet. Or communicate globally through the CCITT X.25/X.29 Packet Switching Network.

And that's about the size of it. Except to remind you that Perkin-Elmer is strongly committed to supporting your systems with complete customer training, worldwide service. . .and world-class products.

We invite you to "size us up" soon.
For more information, return the coupon.
Or call toll-free 1-800-631-2154.
In New Jersey, 1-201-870-4712.

Figure 4. Dollar equivalent of professionals' time savings over six months

help users and software purchasers directly relate productivity benefits sought to software features desired.

The first step in this procedure is a careful needs assessment of users' key productivity goals.

The second step is to match those goals to the software features desired to achieve the productivity goals.

The software purchased is directly linked to the productivity goals of users. For example, in text processing activity, a desired goal may be to enhance accessibility. Software package features that will support those goals for accessibility, for example, are Help functions and computer-aided training (tutorial diskettes).

The software strategy should define the desired productivity benefits both for users and for the organization. After that, a set of features can be specified to offer a direct link to the productivity goals.

If the strategy specifies "enhanced access to data," this goal should be linked directly with a feature to be implemented. The link to the feature will indicate if the organization is on target when it purchases and installs the system.

Communications capabilities

Software should also be evaluated for its communications capabilities. Research by Lodahl (Figure 4) shows that executives who use their personal computers across work groups or across locations obtain the real benefits from an office system. The payback is almost double that from a stand-alone system.

Among the desirable communications features are the following:

- **Data analysis.** The spreadsheet may be fine, but can one user send it to another?
- **Word processor.** The software may create a single-user document, but can one user transfer that document to another in the work group? If so, how?
- **Electronic mail.** Can a user attach documents to a message and forward it? How does he do this from his workstation?
- **File exchange.** Can a file that has been created — text, graph or program — be transferred to another user? Is the file transfer in a standard format? Which format?
- **Multiple users.** Can multiple users access this program at the same time from a work group computer?

What happens if one user updates a record on a data base? Are other users locked out? Can users access files on other workstations? Is it possible to set multiple levels of security access?

- **Integrated personal computer packages.** These packages are well integrated within their own environments, but can a graph or spreadsheet be transferred from them to the company minicomputer or mainframe?

Level of integration

Figure 5 (on ID/20) outlines the trend in office systems over the next five years, starting at Level 4. Note that in selecting integrated software, it is important to evaluate the system, the peripherals and their level of integration. If hardware is not integrated at Level 5 — a full work-group system with fully integrated peripherals — the purchase of stand-alone personal computer software integrated only on one personal computer may not work.

Look for the open architecture of the software to allow a long-range capability to integrate the software into a corporate office systems network.

After examining the trends in integration, an organization should check to make sure the user interface is well integrated. Key features to look for are the following:

- Same command set through the entire environment for the equivalent action.
- Transparency between functions. To move between functions, a user does not need to know the technology, just what he wants to do.
- A user knows where he has been, where he is and where he is going in the environment.
- Service functions — such as file

It's how IBM's newest cache makes DASD faster.

To dazzle you with their performances, jugglers anticipate every move of every ball. And now IBM DASD uses anticipation to turn in a nimble performance of its own.

By selecting the data most likely to be needed at the CPU, the new IBM 3880 Model 23 Storage Control Unit can allow DASD subsystems to perform at electronic speeds. A microprocessor dynamically identifies the most active data and keeps it available in high-speed cache storage.

So when the CPU issues a disk read command, many of the responses may actually come from cache. When that happens, mechanical motion is completely eliminated as a factor in DASD response time.

IBM has combined its proven cache storage techniques with high-performance IBM 3380 DASD. This makes the Model 23 the preferred price/performance alternative for many transaction-oriented systems (those running TSO, CICS or IMS, for example) in which I/O activity is limiting CPU performance.

Using the Model 23, you may see one or more of these performance gains: Increased transaction volumes. Higher CPU utilization. Faster response to end users. Shortened batch run times. Or reduced contention for "shared" DASD.

And you may be able to lengthen DASD strings without affecting performance.

This new control unit has 8, 16 or 32 megabytes of cache, using IBM's powerful 256K-bit chip. It offers more speed, lower cost and better reliability.

The Model 23 follows the Model 13 in IBM's family of cache storage devices.

For a free brochure to help you anticipate better IBM DASD performance, just call 1 800 IBM-2468, Ext. 90, or return the coupon. Or call your IBM marketing representative.

Figure 5. Office systems integration levels

management, printing or peripheral devices — are easily accessed without convoluted techniques to make them function with the present activity.

- Recognizable commands (in contrast to memorized commands) are available.
- Users can easily move from a learning mode (with screens) to a quick access method, such as a mouse or one-letter commands.

To ensure compatibility and flexibility in the future, evaluate two areas: first, the integration level of the organization's software compared with the integration level of its hardware and, second, the organization's long-range plans.

Demonstration/pilot

Be sure to get a thorough demonstration of the software doing exactly the kinds of functions the organization plans to be doing. Visit customer sites and ask users how they would rate the software, the vendor and his support and the growth path and upgradability of the software.

Check to see if a "fly before you buy" program is offered; these programs allow the software to be used on a time-sharing bureau prior to actual purchase. If a complex system is being considered, a good idea might be to have a pilot installed at the organization's site and evaluate the results after a trial run.

Check the built-in learning systems of the software package first. Can a user understand how to use the package without using the manual?

Most users will probably not take the time to read the manual and thereby will get only 10% to 20% of the functionality the product offers.

After the initial stages of learning have been completed, are classes available? In addition, are phone-in lines available? Can the vendor provide implementation planning support? If a bug turns up, ask the vendor how long it will take to fix and what the procedure is for fixing it.

Finally, evaluate the company, based on an investigation of whether it can be expected to be around to help later. Check on the company's background.

Asking a few support and training questions up front could save thousands of dollars and headaches in implementation later.

Strategy for success

"If you don't know where you're going, any road will get you there" is as relevant to the state of many OA software purchases made today as it was for Alice's journey. However, defining goals that will link directly to critical business factors and then taking into account the users, productivity goals, communications, integration and implementation issues can ensure an organization's successful software purchases.

Using the right software strategy to purchase OA software can enable a company to hit the productivity jackpot. A strategy for software and implementation of office systems will enhance a company's productivity, reduce costs and give it the leverage it needs to have a competitive edge.

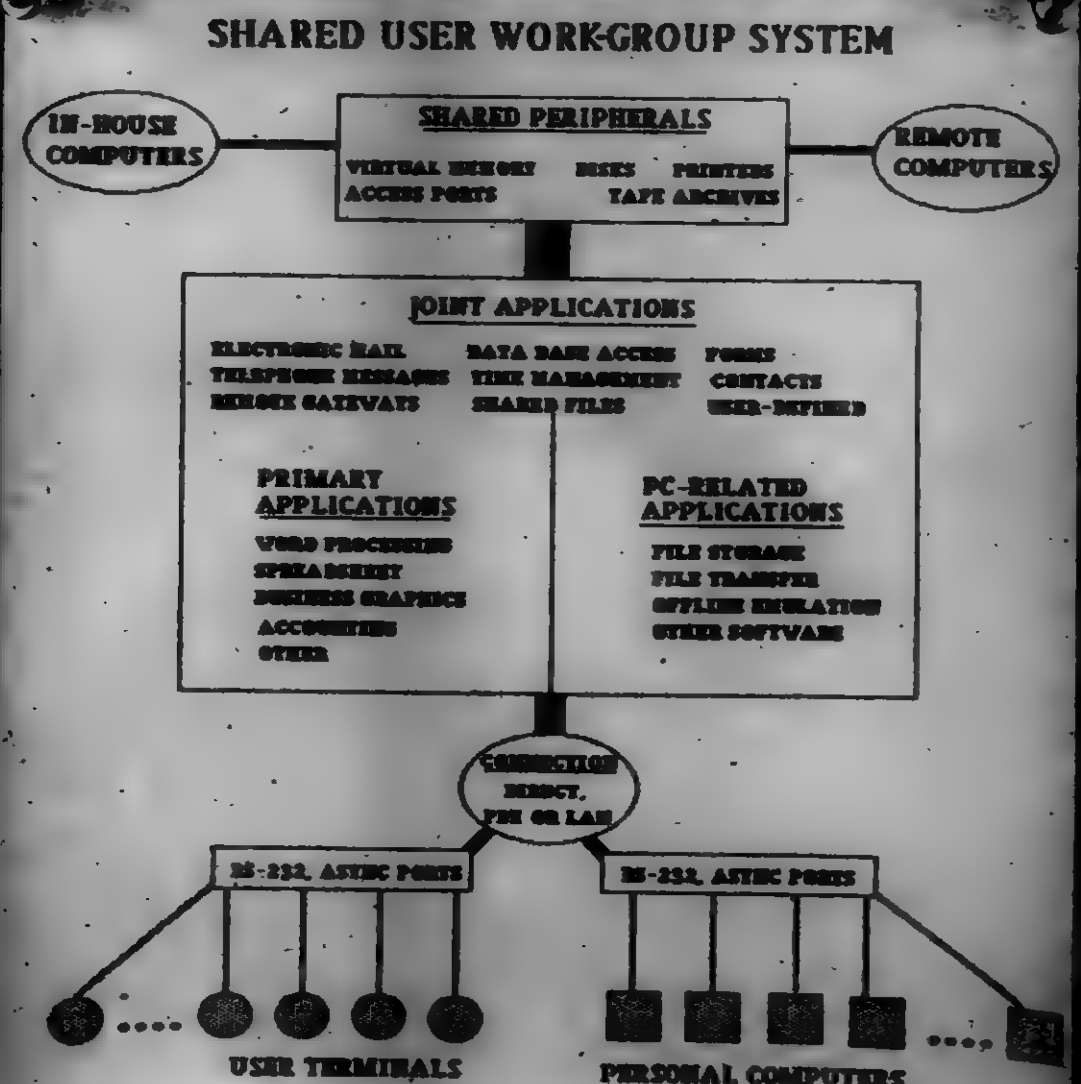
Work-group systems share the load

By Stephen Caswell

A funny thing happened to both [redacted] data processing three years ago. As MIS departments began planning their move to the integrated office, the IBM Personal Computer hit the market and caught a wave. The wave demonstrated beyond a shadow of a [redacted] have computing power at their fingertips.

At first, MIS departments laughed at the prospect of personal computers being useful. Before long, however, the flood of machines could not be ignored. With processing power in the hands of inexperienced users, MIS departments were deluged with requests for help. Noncomputer types rushed to tap into the power unleashed by microcomputer software, which has four main driving forces — the spreadsheet calculator, micro data base packages, word processing and accounting.

Today, MIS departments are saying that although it's been a tough battle, the proliferation of personal computers is under control. Most companies now have procurement policies, rules



SHARED USER WORK-GROUP SYSTEM

Source: Trigon Systems Group

Figure. Terminal and PC users can access a workgroup system either directly or via a PBX or LAN. Both have access to shared peripherals and joint applications. PC users will run primary applications offline, while terminal users will run them online.

and regulations, recommendations and so on. There's only one small problem: If the personal computer is seen as an accident, it's possible to argue that it's controllable. But what happens if, instead, the personal computer is really an indication of an enormous, pent-up demand for processing power — a demand that literally permeates environments traditionally untouched by computers."

Broad-based changes

From this perspective, the personal computer is only the first of a series of waves of technology that will sweep into business organizations. Furthermore, the movement is by nature uncontrollable because the waves are broad-based. They don't just wash into the MIS department's doors, where they could easily be controlled by a few purchasing agents.

In short, it's quite possible that we have a classic revelution that permeates from the bottom of society upward. Instead of technology being owned and controlled solely from the top down — as it was by MIS departments in the 1960s and 1970s — technology will now sweep into organizations from the bottom upward as well. If this thesis is true, there is a second wave coming that will be just as challenging as the personal computer wave.

Recent research by James H. Bair, manager of advanced functions in Hewlett-Packard Co.'s Office Systems Group and formerly of the SRI-Xerox Palo Alto Research Center group, describes the results of an interview program conducted with 691 "knowledge workers," otherwise known as common folk who inhabit offices.

The study's findings, which were similar to those of dozens of other studies conducted over the years, included the following:

- Office workers spend an average of 65% of their time in interpersonal communications. The variant is individual style, not position in the organization.
- Most face-to-face communication is with the immediate work group (48%); the remaining 52% is divided across the same building (17%), at different locations within the company (13%) and external (22%).
- The majority of written communication is within the same work group (38%); the remaining 62% is divided across the same building, at different locations within the company and external to the company.
- Most paper is stored within the person's office and work group.

Bair's findings should not surprise anybody. They are the equivalent of proving that friends send Christmas cards to friends rather than to enemies. But the findings do confirm what has been an unsettling statistic from the Yankee Group and Future Computing — that personal computers are used, on average, only 30 to 60 minutes a day.

Personal computers are used, on average, only 30 to 60 minutes a day.

Although many have concluded that the low usage of personal computers shows they really have not been needed and have been purchased improperly, a very different interpretation results if the personal computer is viewed as an indication of a bottom-up revolution.

The next technology wave is going to attack interaction among work groups. The problems that will be addressed are keeping in close touch with colleagues, accessing common sets of information and spreading computing power from those who have personal computers inside a work group to those who do not.

Two models

The catch phrase for the wave will be something like "work-group systems." Two models are now coming into focus. The first is based on a local-area network with one or two personal computers designated as file servers and gateways. The second is based upon a supermicrocomputer that serves as a file server for those with personal computers, as both a server and primary source of computing power for those with only terminals and as a gateway to remote computers for both groups (see figure on ID/21).

The personal computer focuses on individual applications — for example, a spreadsheet or word processing document. In contrast, the work-group system will offer these applications but will also attack the problem of interaction. The new applications will be electronic mail, time management, data base access, remote computing access and sharing of common files.

Although many people still look at electronic mail as a remote phenomenon, those who use it recognize it is more important to the work group than to remote communications. It is simply far more efficient to communicate electronically with colleagues, even those who sit on the same floor. Electronic mail won't replace all face-to-face interaction, but it will enhance the process of keeping in touch with fellow workers, especially when more than one must be contacted at the same time.

An equally important application is sharing data bases — simple ones as well as complex. A work-group system will, for example, allow a common data base of names, addresses and phone numbers. It will allow telephone messages to be stored so that phone message slips don't get lost.

Such a system will also allow storage of company information, such as

If you're not using fiber optic telecommunications you'll be getting a lot of static.

!☆✻!◎
◎#★!

Suffering from snarled data transmission? Tired of waiting six months for a dedicated line? Your future telecommunications problems will be solved by fiber optics. And we bring that technology to you today. We are Litel Telecommunications Corporation.

We have established a high-speed, high-capacity, 1600-mile digital network in an area roughly bordered by Chicago, Detroit, Buffalo, Pittsburgh and Louisville. It includes 19 LATA'S and provides voice and data services. Unlike most other communications companies, we are 100% fiber optic and we are facilities-based. Our current services include DS-1, DS-2, DS-3 and VF dedicated lines in voice/data speeds and configurations.

So if you need fast, reliable, low cost, high volume telecommunications, you need Litel. We'll help you solve your telecommunications problems before you start getting a lot of static.

When all else fails.

Most diskettes are pretty good.

And some of the time that's good enough.

But next time you throw away one that won't format or you lose the cash flow analysis you've been working on for weeks, make a mental note to try a box of Dysan diskettes.

They're better.

So much better, in fact, that major computer manufacturers put their names on our diskettes and sell them as their own.

Without fear of failure.

You see, we make our diskettes better with advanced manufacturing processes that our competitors have yet to figure out.

And we test them.

Almost to the point of absurdity.

Dysan diskettes are inspected almost a hundred times as they come down the line. They're tested to performance levels way beyond industry standards. And each one is certified to be 100 percent error free.

Then our corporate quality assurance fanatics come along and check them all over again. For all the same things. Plus some things only they understand.

When we're done, you get exactly what you wanted in the first place. Diskettes that will record and retain all your data all the time.

We don't expect you to keep all that in your mental note, but we would like you to remember your last diskette failure.

And when your computer products dealer offers you another box of pretty good diskettes, tell him you're ready for something better.

Dysan.

Call toll free for the name of the Dysan dealer nearest you. (800) 551-9000.

Dysan Corporation, 5201 Patrick Henry Drive, P.O. Box 58053, Santa Clara, CA 95050, (408) 988-3472.

FREE *pfs: write* DEMO DISKETTE.

There's an extra diskette in every specially marked Dysan box. It demonstrates the best-selling word processing program, PFS: WRITE. And it can be easily converted to a data diskette. See your Dysan dealer today. Quantities are limited.

price lists, products, company policies, reports and financial data. In addition, it will allow common business forms to be put on-line, which will speed their production and movement throughout the work group. In short, the work-group system will make life easier for people who work in offices.

The two final benefits of work-group systems are access to remote computing facilities and shared files. Although a work-group system isn't necessary for remote access capability, it will be very cost-efficient by eliminating the need for costly modems and interface cards at each personal computer. Instead, a gateway can be built to allow a group of users to share a few outside access ports based upon overall need.

Work-group systems will also allow common reports and planning models to be shared among all those who must contribute to their development. Today, this sharing is accomplished through the "Adidas Net" approach — you put on your sneakers and run the floppy disk down to the person who needs to share the file and hope that person can run the same software package properly.

Work-group systems are just now hitting the market. Software for local-area networks is starting to mature. More important, software for Unix-based supermicros is becoming available. NCR Corp., for example, has introduced work-group software for its Tower supermicro that runs Century Analysis Corp.'s (Pacheco, Calif.) Officeware. For $58,000, a firm can buy eight microcomputers plus a Tower-based work-group system.

By early next year, at least four other strong contenders should also be offering Unix-based software for work-group systems. The four firms are Applix, Inc. (Southboro, Mass.) with its Alis system; Emerald City, Inc. (Toronto, Ont.) with its Emerald One; Handle (Tahoe City, Calif.) with its Interactive Office Series; and Syntactics Corp. (Santa Clara, Calif.) with its Crystal Focus. At least 20 other companies are developing such software, but haven't made formal announcements.

IBM's blessing

IBM has blessed the work-group system market with two products. The first, its Personal Computer AT, can support multiple users running Microsoft Corp.'s PC Xenix. The second is the System/36 small business computer, which is being positioned as a departmental work-group system within IBM's network architecture. The System/36 is expected to act as a middleman between PC-based workstations and mainframes.

Prices for work-group systems will be wide-ranging: $2,000 to $3,000 per user on personal computers and from $2,000 to as high as $7,500 for users operating terminals, depending on the system.

Those who think this is expensive should consider that the work-group system is likely to double or triple the amount of time the user will find the personal computer useful. At the same time, it will typically cost considerably less than giving each user a Personal Computer/XT or equivalent. It will also open the door to shared peripherals — such as laser printers — which will improve the quality of output.

Work-group systems are coming. As was the case for the original personal computer, the movement will be sparked by user demand. MIS departments that ignore the new wave will get caught just as they did before — regardless of all the rhetoric of policies and control.

To put it another way, the technology is an ocean and all we've been able to do is figure out how to ride the waves.

How to gain control of your company's data communications with just a single phone call.

CALIFORNIA BUSINESS ON THE MOVE

Right now, one phone call could make a dramatic improvement in the way your company does business.

If that call is to Pacific Bell.

Because Pacific Bell is a single convenient source for the capabilities you need to control your data communications — control that can make your company more productive, more competitive, and more profitable.

These capabilities are yours in a complete family of digital data transmission services created by Pacific Bell to satisfy your company's present needs, and grow as your business grows.

Public Switched Digital Service*: A first of a kind in California.

Public Switched Digital Service is an exclusive addition to Pacific Bell's Network of Services, combining the economical simplicity of a dial-up digital data transmission service with a wide range of advantages.

- High speed data transmission (56 Kbps).
- An objective of 95% transmission accuracy [illegible]
- High cost efficiency for up to approximately three hours of uninterrupted usage per day.
- The flexibility of multi-point contact on a single system.
- Convenient over-the-phone-line operation for economical backup to other systems in case of overload.
- High security. Transmissions can be encrypted with appropriate hardware.

Digital Data Service: Step up to higher capacity, and guaranteed performance.

With Digital Data Service, you can transmit data at 2.4, 4.8, 9.6 or 56 Kbps to any dedicated line destination.

99.5% error-free seconds of transmission is guaranteed. And line availability, by Pacific Bell's design objectives, is 99.96%. Downtime, if any, should not exceed 3.5 hours per circuit year.

A centralized testing capability enables one person to pinpoint possible system problems almost instantly. So restoral time is minimized.

Signals are recreated — not just boosted — in long distance transmission, [illegible]

High Capacity Transport Service: A most efficient answer to your most demanding transmission requirements.

For high speed, bulk data transfer capabilities, High Capacity Transport Service is an excellent choice of services.

Voice and data messages can be transmitted over a single, ultra high-capacity line at speeds up to 1.544 Mbps.

Outstanding cost efficiency is designed in, with performance standards of 95% error-free seconds of transmission, and 99.96% line availability.

SPECIAL OFFER to help you choose the right service — or services — for your business.

CALL THE TOLL-FREE NUMBER BELOW FOR A FREE ON-SITE ANALYSIS of your business data transfer requirements. Plus specific examples of how Pacific Bell can help bring your company's long-range goals closer to today.

CALL NOW, TOLL FREE, 1-800-622-0735, EXT. 282.

Or write Pacific Bell
Business Communications Center
620 Folsom Street, Room 305
San Francisco, CA 94107

These services may not yet be available in your area. Contact Pacific Bell for availability information.

IN DEPTH

THE UPS AND DOWNS OF BUBBLE MEMORY

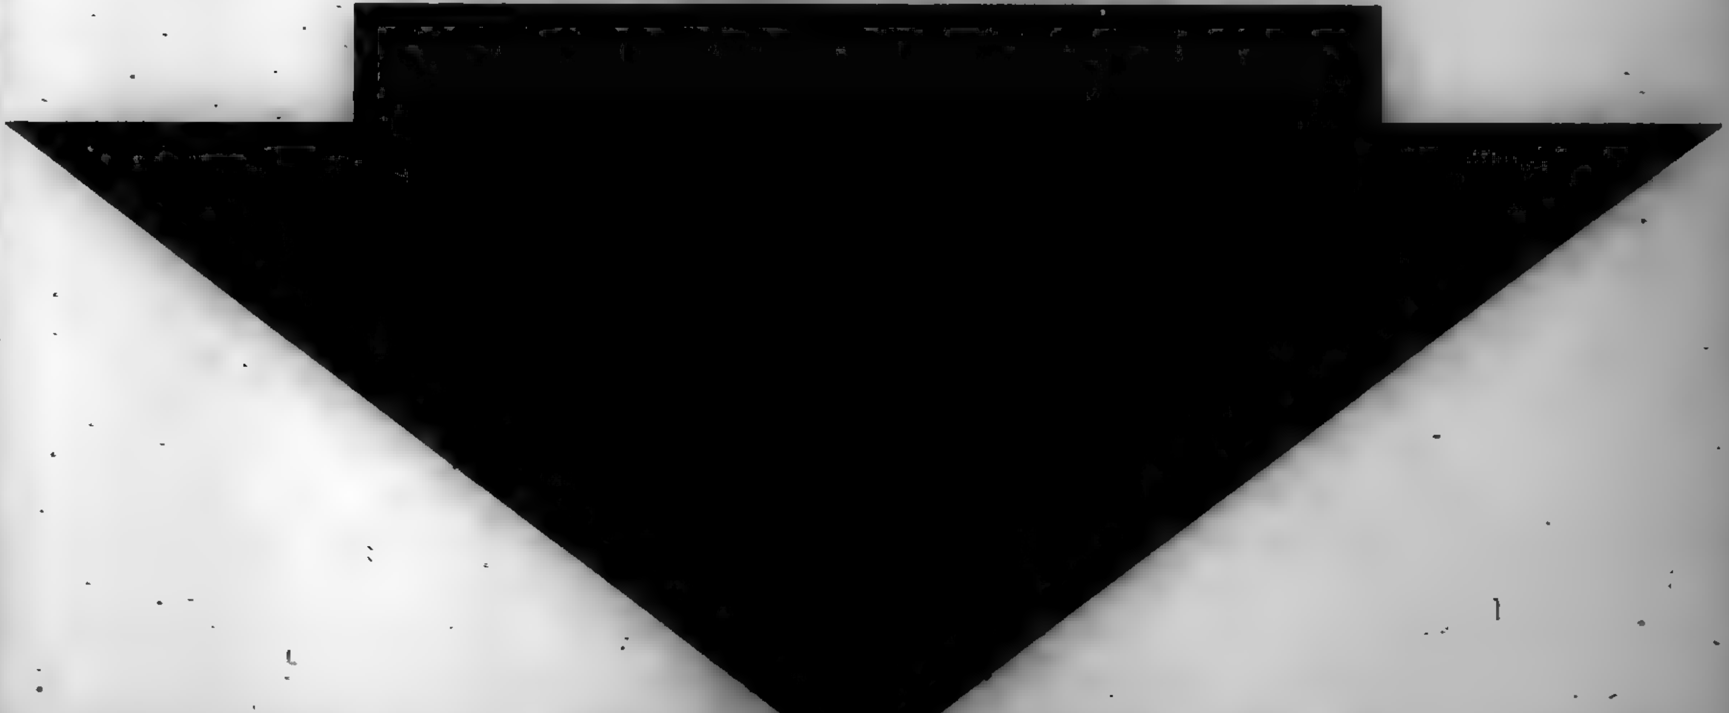
By Robert Luhn

In use, bubble memory has little to do with delicacy and even less to do with liquid or physical movement. Bubble memory is a second cousin of contemporary chip and disk memory. Its history stretches back to the era of James Clerk Maxwell's 19th-century studies of magnetism.

Like the floppy disk, bubble memory stores information magnetically with microscopically magnetized areas representing a 1 to the computer and unmagnetized areas representing a 0. Similar to random-access memory (RAM), bubble memory is found on a chip (of garnet instead of silicon) and thus is solid-state, with no moving parts.

Unlike disk memory and RAM, however, bubble memory does not lose data when the power goes off. In addition to this nonvolatility — an outstanding advantage in most applications — bubble memory is faster than floppy or hard disk memory, although it is considerably slower than RAM.

The bubble that gives its name to this type of memory is not a physical bulge raised in the garnet wafer, but comprises small cylinders of magnetism. Each cylinder, or domain, is positive on one end and



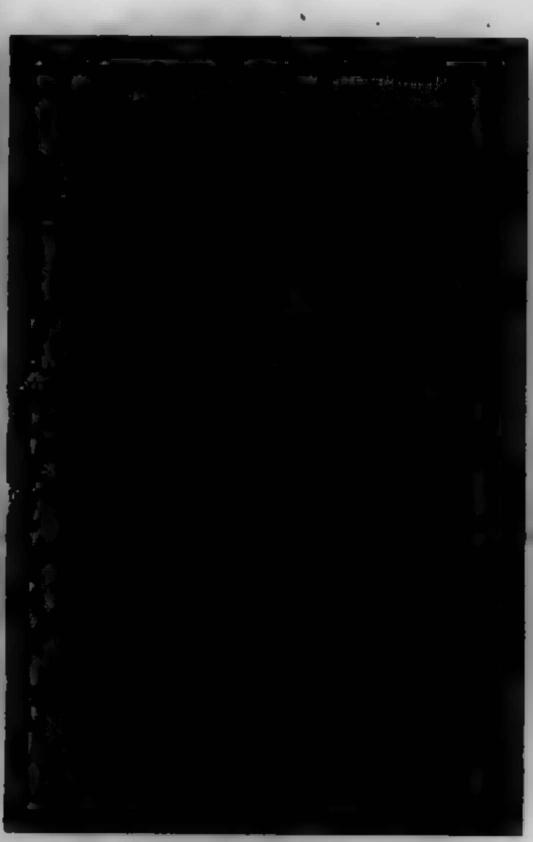
One of the smartest reasons to buy Digital.

Digital Service.

From the moment you choose Digital, our service organization goes to work to protect your investment. We'll develop your software applications. Train your employees. Keep your system up and running. We're ready to provide the support you need, whether you are running a single system or a large network of systems. Our engineers have even worked alongside customers to build new computer sites with the proper power, air conditioning, and fire protection. From start to finish, Digital Service is a smart decision.

Our people help your people develop the skills they need to get the most out of your Digital computer. We offer more than 500 courses on hardware, software, and office automation. At Digital's worldwide Training Centers. Or at your location. And, at your request, we will even customize training to meet your special needs.

Because no other business is like yours, Digital's software experts help you select the right applications for your business. Or they tailor programs to fit the way you work. And whenever you need the answer to a question or problem, specialists trained in your software applications are only a phone call away.



You select the level of service you need: whether you need on-site hardware support 24 hours a day, seven days a week, with our unique commitment to when service will begin, or the economy of carry-in or mail-in services. Digital gives you a choice.

Digital has over 20,000 service professionals worldwide to give you peace of mind with fast, personalized service. And we deliver that service when and where you need it. That's why Digital Service is the smart choice.

Digital Service is everywhere, because Digital's customers are everywhere. Our specialists regularly service Digital's systems on remote islands. On board ships. Even at the South Pole.

For more reasons to buy Digital Service, call 1-800-DIGITAL.

IN DEPTH/BUBBLE MEMORY

negative on the other and is formed by a group of atoms in the garnet whose magnetic poles are aligned.

These domains normally point in random directions within a garnet crystal. When the garnet has been properly cut into a thin, flat wafer, the domains jut perpendicularly through the plane of the chip, with their positive ends pointing either up or down.

The old axiom about opposites attracting comes into play in bubble memory technology. The more "up" domains you have, the more strongly they interact with those pointing "down," causing the bubble to grow larger. An opposite force to this ballooning effect occurs at the wall of the bubble, where domains are in various stages of pointing down, crosswise and up. This area of transition bounding the bubble tends to widen and slow the bubble's growth (see Figure 1).

As nature will have it, one force always overcomes the other. The bubble either continues to expand or it collapses upon itself.

Making bubbles stable (and useful) is accomplished by pointing an external magnetic field down over the entire chip (see Figure 2). In bubble memory devices, the field is supplied by a fixed, permanent magnet. The domains shrink considerably until they are about .0001 in. wide; when viewed from above through a microscope, they appear round — hence the bubble designation.

The garnet is magnetized in a down direction, and those domains whose positive poles point up against the field are the bubbles in their useful form. Because like charges repel, spacing between bubbles is more or less uniform. As long as the external field is kept constant, the bubbles neither collapse nor expand and are held to an acceptable size.

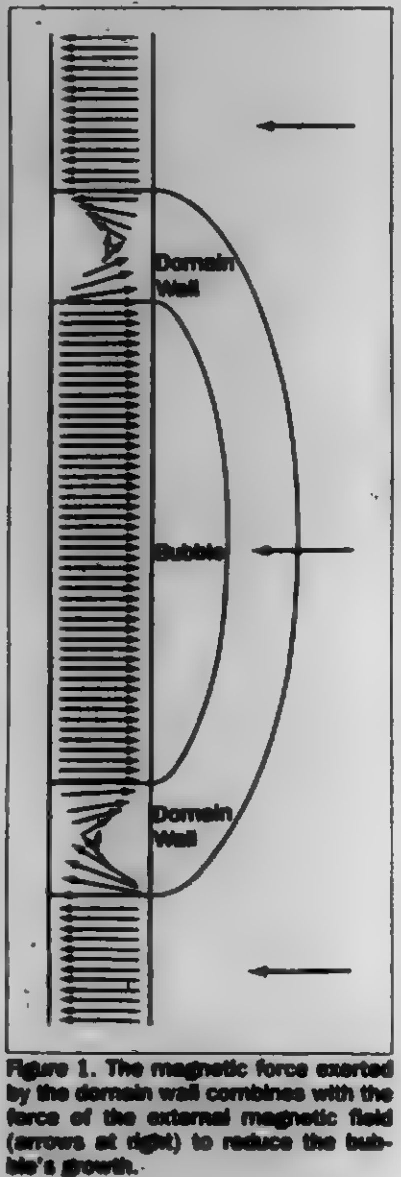

Figure 1. The magnetic force exerted by the domain wall combines with the force of the external magnetic field (arrows at right) to reduce the bubble's growth.

> *The problem with bubble memory is that access to the stored information is sequential. Data on a RAM chip can be accessed randomly because each bit has it own addressable location. But bubbles move like links in a chain.*

Difference from disk

The presence of a bubble indicates a 1, its absence a 0. Bubble memory employs the same binary method of representing information magnetically as is commonly used in disk storage. However, getting the information to the computer is where the analogy breaks down.

With disk storage, the information is magnetically embedded in the disk and a mechanical head moves out to read it. With bubble memory, the magnetic domains (bubbles) are moved through the chip to a location where they can be read. The sequence of bubbles and no bubbles makes up the stored data.

Moving bubbles requires setting up a rotating magnetic field within the plane of the chip. This is accomplished by wrapping the chip with two crossed wire coils and running the appropriate current through them. The bubbles are then shuttled down metal pathways that have been deposited on the chip. These paths are not grooves but rather thousands of inlaid, miniature V-shaped steps arranged in certain patterns. One arm of each V is thicker than the other, and when the rotating field is on, it acts like a magnet, drawing the bubble up one side of the V and down the other. In this manner, each bubble travels from

Give people the tools th
and there is no limit to what

Announcing the first major breakthrough in word processing technology since WordStar.

Now, state-of-the-art comes easy.

Introducing WordStar 2000, a totally new word processing program from the makers of WordStar.

WordStar 2000 removes all limits from word processing. From what you can create. From what you can achieve.

Because WordStar 2000 lets you do everything.

Easily.

From windows, to undo, to spelling correction, WordStar 2000 does it all. And more.

WordStar 2000 gives you the works.

"Windows" allows you to work on different documents—simultaneously. "Undo" lets you replace text you mistakenly removed. A built-in spelling corrector checks and corrects misspellings from over 97% of the most commonly used words.

WordStar 2000 also has a "typewriter mode" to fill in forms or envelopes easily. Plus "format sheets," which give you ready-made headings, tabs and margins at the touch of one key. It can even create and update footnotes.

Finally, a truly integrated word processing system.

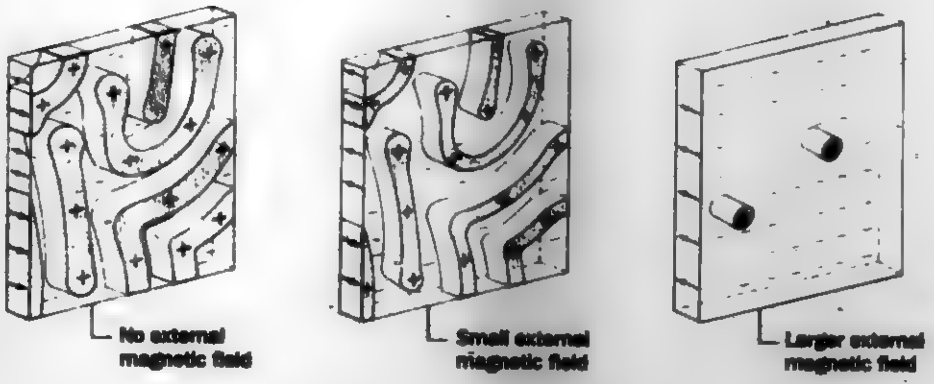
WordStar 2000 goes well beyond words.

It comes with a built-in five function calculator. A built-in mail merge enables you to mass produce form letters. Get our special Plus package and you also get a built-in mail list data base that allows you to create, update and sort your own mailing lists. Also a built-in indexer. Not to mention built-in telecommunications capabilities.

All integrated together, so you never have to leave the program.

The only word processing program that interacts with you on your level, whatever your level.

Before we created WordStar 2000, we studied the way people worked, and thought. We also drew from our experience with over 1,250,000 WordStar owners.



No external magnetic field
Small external magnetic field
Larger external magnetic field

step to step on its way to a desired location.

Sequential access

The problem with bubble memory is that access to the stored information is sequential. Data on a RAM chip can be accessed randomly because each bit has it own addressable location. But bubbles move like links in a chain.

If you have one million bits stored on a bubble chip and the information you need is halfway down the chain, all the bubbles must move half the length of the chain, in this case 500,000 steps. A typical rate of movement for a bubble is about 200,000 steps a second. In the preceding example, it would take a little more than two seconds to get the information you wanted. While this may seem relatively quick, it is far too slow for a computer.

Getting around this limitation means redesigning the pathways on the chip. Approaches vary in minor respects, but most modern bubble chips use a system of major and minor looped pathways. The minor loops, which are thin and elongated, are laid next to each other and constantly circulate corresponding bits of stored information.

Surrounding the minor loops is a larger, major loop whose straight sides contact both ends of each minor loop. One side of the major loop is the input track; the other is the output track.

The advantage of this configuration is that blocks of data are separated from one, long continuous chain. To read data from a minor loop, the circulating bubbles are duplicated and sent down the output track of the major loop to be read and then collapsed. Meanwhile, the original data remains intact in the minor loop. Bubbles can be exchanged (on the input side) and replicated (on the output side) between the major loop and all of the minor loops simultaneously.

As a result, instead of taking 500,000 steps to read a record, an average of only 1,500 steps is needed. This reduces access time from two seconds to 40 milliseconds. While this is 1,000 times slower than RAM memory, it is two to four times faster than either hard or floppy disk drive systems.

Staying power

The real appeal of bubble memory is the amount of data that can be stored and how well it remains intact. The error rate for a bubble memory device (say the 128K-byte bubble memory board made by Intel Corp.) is exceedingly low; chances of a user receiving an incorrect bit are one in 10^{25}. In a real use, this translates roughly to one error in 100 years of normal bubble operation. This reliability is further supported by a storage environment that is free from the ravages of power failure. The reason lies in the design of the bubble memory device.

The external magnetic field that lets the bubbles exist is created by permanent magnets. They are not subject to the whims of a downed power pole or a computer power plug that is accidentally kicked out.

If the current in a bubble device is suddenly cut off, the rotating field that drives the bubbles stops and so do the bubbles.

Bubble memory's nonvolatility makes it useful for almost any

As a result, the keys you press are the keys you'd expect to press ("c" for copy, "p" for print, etc.). You may also use your computer's function keys. Menus have been uniquely designed for easy access to all functions. And MicroPro's exclusive "tutor-in-your-computer™" makes learning fast and fun.

WordStar 2000 is the easy word processing program you'll never outgrow. Of course, the original WordStar and WordStar for PCjr will continue to provide substantial and proven word processing capability for those with more modest budgets.

See your local MicroPro dealer today or call (800) 227-6703 [in CA (800) 632-7979] for the dealer nearest you.

So you can remove all limits from what you can achieve.

Current WordStar owners can upgrade to WordStar 2000 quickly and easily through their dealer, or by calling MicroPro Customer Update (800) 227-5609, 9am-3pm P.S.T.

WORDSTAR 2000

Now there are no limits.™ MicroPro.

situation in which data that is being stored or worked on must be maintained. Nonvolatility also makes bubble memory portable, so a user can remove a bubble device from a computer, transport it across country and then plug it into another computer and find all the data intact.

Most important is the amount of data that can be packed onto the bubble chip. A typical chip with its attendant magnets and shielding occupies about 2 sq in. and offers 128K bytes of storage.

Comparable erasable programmable read-only memory (Eprom) and RAM chips hold a maximum of 32K bytes. A floppy or hard disk system certainly holds as much, if not more, information than a bubble, but the size, or volume, of the system can be an important factor when you consider portability, storage space and ease of use.

David Airel, manager for advanced development at Teleram Communication Corp., a maker of portable computers and terminals using Intel bubbles, has come up with a memory cost-efficiency table comparing bubble memory with disk memory (see Figure 3 on ID/32). While Airel admits that the table is not strictly scientific, it reflects the relative value of each approach.

As the table indicates, bubble memory often outperforms a floppy disk system and manages to float along nicely in the wake of a hard disk. The bubble provides compact, cost-efficient storage, two factors that are crucial in certain applications.

When the price of systems is compared, though, bubble memory does not take first place. A typical floppy disk system is $135 cheaper and offers removable storage in the form of inexpensive disks; a hard disk drive, though bulky and delicate, offers true mass storage at a reasonable price.

Cheaper bubbles

Why is bubble memory still playing catch-up in the marketplace? The answer is tangled within 15 years of production problems, mistimed marketing moves and a dearth of research money. The irony is that in the late 1960s, bubble memory was seen as the answer to unwieldy mainframe magnetic core memories and slow disk systems.

Bell Laboratories, ever in pursuit of cheaper ways to store telephone numbers, gave bubble research its first big push. Contemporary mainframe computers used at Bell to handle telephone data were slow, power hungry and not terribly efficient in their use of storage. The cost of storing a bit was about one cent.

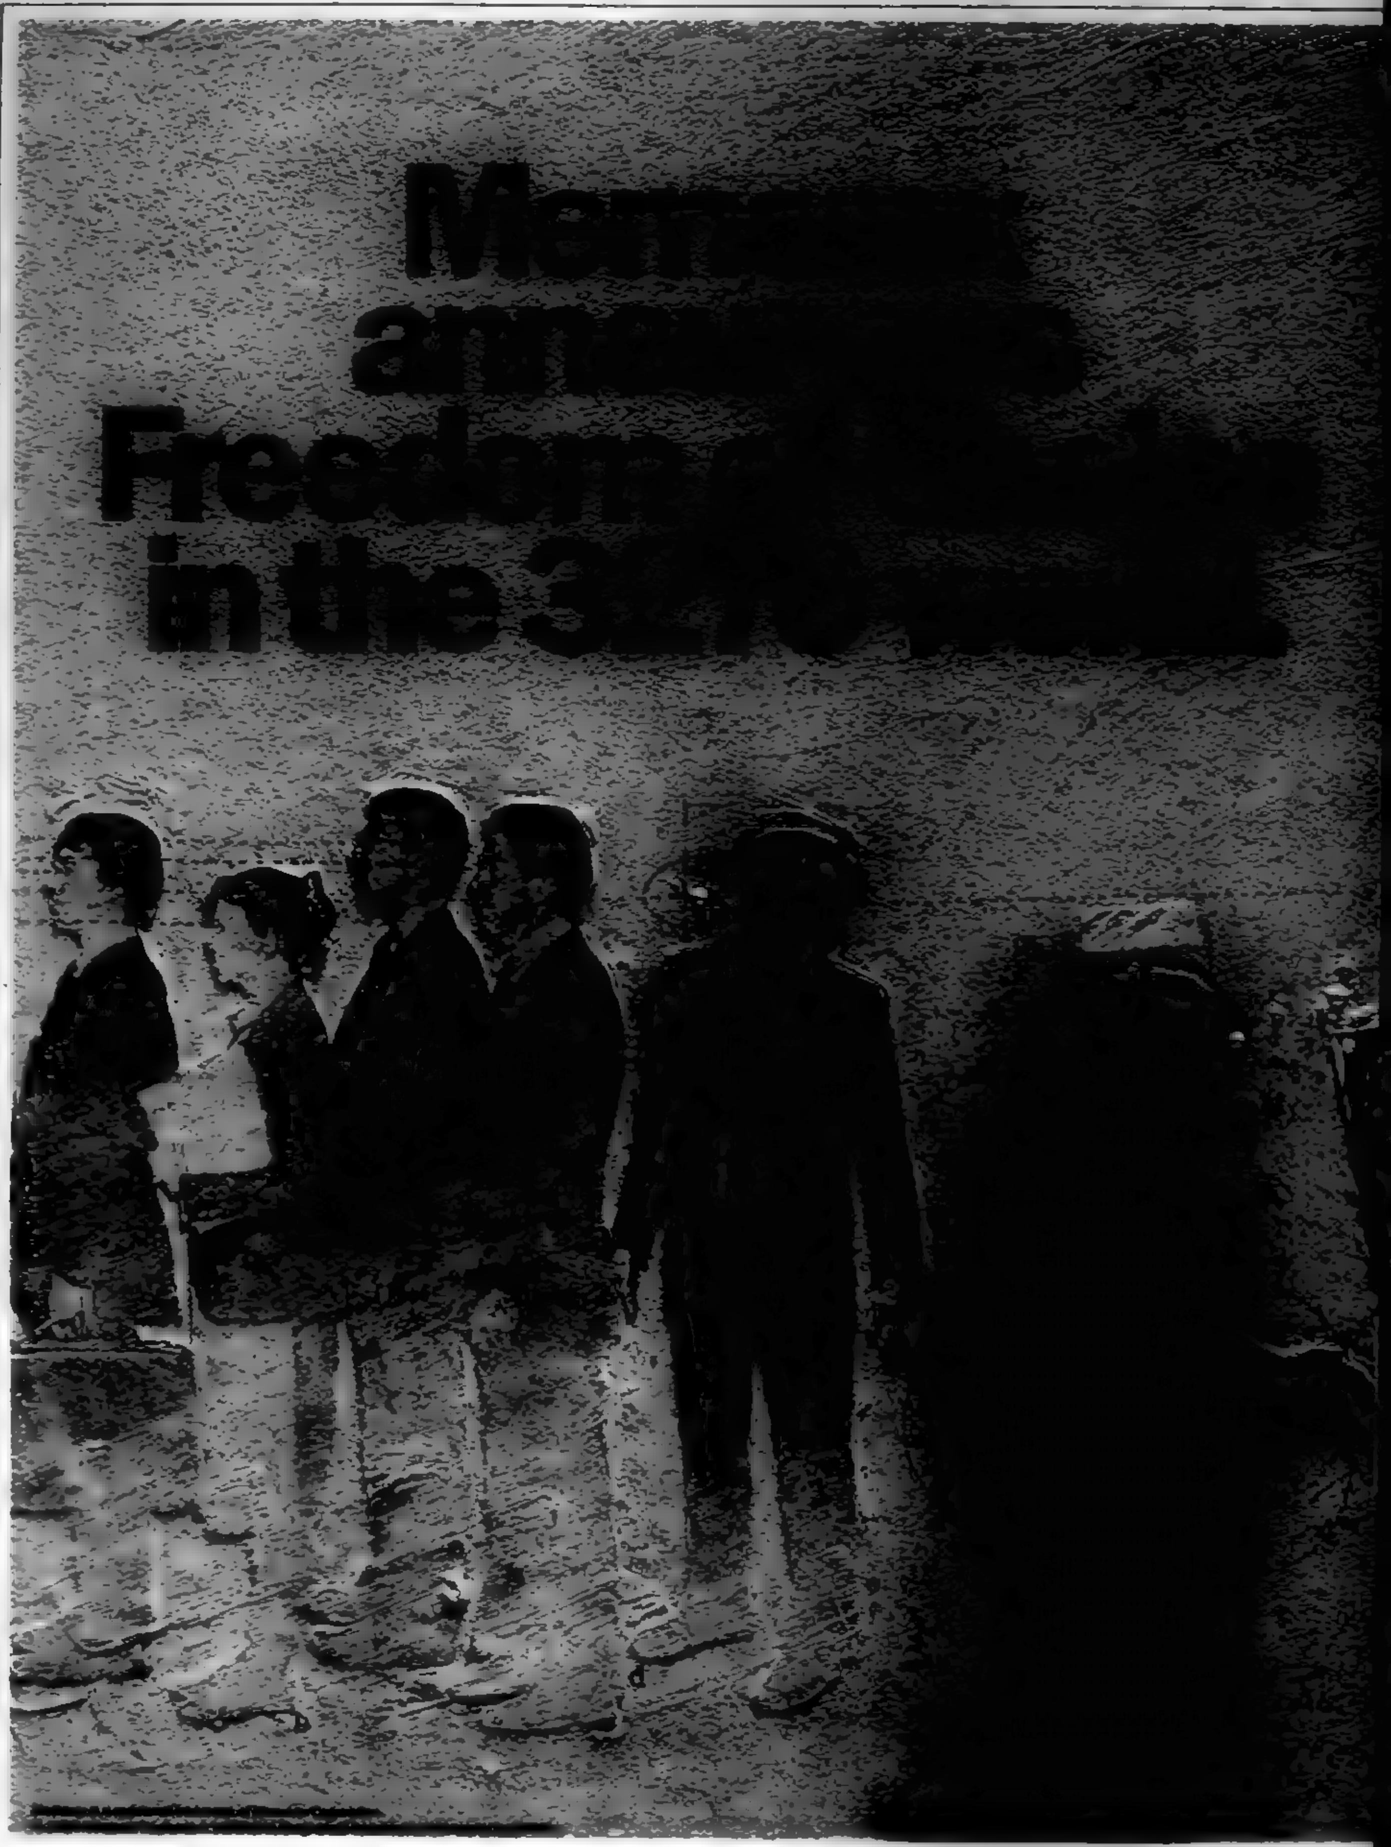
This may seem a small amount, but as applications grew larger and more complex, storage requiring 1M byte of memory became a substantial expense. Bell scientists quickly realized that bubble memory could offer much lower power consumption, coupled with speed and greater data density.

Research continued at Bell Labs and at a number of other companies including IBM, National Semiconductor Corp., Motorola, Inc. and Texas Instruments, Inc., all of which eventually began to produce or use bubble memory. The problem was that the technology supporting it was untested and expensive.

The promise could not begin to beat the cost of production. Sales of bubble memory products faltered, and one by one, companies cut back or dropped bubble production and research. With the advent of RAM and ROM chip memories, bubble memory languished.

The lull was finally broken in 1979 when Intel

Why is bubble memory still playing catch-up in the marketplace? The answer is tangled within 15 years of production problems, mistimed marketing moves and a dearth of research money.



introduced a 128K-byte bubble device. Although a later entrant in bubble memory production, Intel made a decision to develop a commercial bubble and support it in the marketplace.

The price was a stiff $2,500, but the increased use of specialized and industrial computers encouraged production. Technology thereafter advanced sufficiently to allow a better bubble to be fabricated in less time and at a lower cost. Today the same 128K-byte component sells for $300.

Cost is still a problem, though. As one former IBM bubble engineer noted, "It's the old Catch-22. The cost of bubbles will depend on how many are sold. As production goes up, the cost drops.

"The technology will receive more resources if more bubbles are sold. The barriers for a new technology are very high. In the U.S., there are probably 200 engineers working on bubble memory and on silicon memories maybe 50,000. Those are long odds for any new technology to overcome; it has to offer a big payoff to be accepted."

In the marketplace

Attitudes toward bubble memory have gone from grudging acceptance to something almost resembling enthusiasm in the past year. A few industry insiders scoff at the notion of bubble memory being anything but a specialty item. But the predominant question being debated is not whether bubble memory will be a force, but where.

By its very design, bubble memory is something of a fence sitter, and this is both its weakness and its strength. It can work inside a computer like RAM or externally like a disk storage system. Right now, bubble memory doesn't completely satisfy either need.

Nonetheless, bubble memory has found its way into a variety of computers. Its nonvolatility and durability make it a natural for factory computers, where dust, vapor and vibration would give any disk drive a nervous breakdown. It is also tailor-made for more exotic locales such as robots on an assembly line or test equipment stationed atop a mountain.

While overcoming obstacles of harsh environments, the bubble has managed to slip off its overalls and don a three-piece suit. From the factory floor, the bubble now finds itself inside every sleek Grid Systems Corp. Compass computer.

This executive portable computer combines Fortune 500 pizzazz with number crunching and color graphics. The unit is little bigger than a textbook, in large part [redacted] ry.

Those who watch and report on the Fortune 500 (or the Indianapolis 500, for that matter) can use the Teleram Communications Corp. [redacted] portable computer with bubble memory. A reporter can take the 3000 on location, write up the story and send it back to the office over a telephone using a modem built into the unit.

Competition has reared its nasty head as well. Until recently, Intel was the lone [redacted] bubble memory in the U.S. Now Fujitsu has appeared on the scene and is tentatively marketing its own 128K-byte bubble device to hardware and peripheral companies. Hitachi Ltd., a long-time bubble leader in Japan, is said to be eyeing the U.S. market.

But most significant is Motorola's reentry into the field under an agreement with Intel. This move alone is expected to boost bubble production (and lower costs) enough to encourage independent companies to take a chance on bubble memory.

Eminent domain

Use of the bubble is already rising. Portable computers will no doubt continue to use bubbles as the demand for such machines grows. Bubble memory is also seen as a logical element in telecommunications and networking, processes that require data to be sent and received quickly and reliably.

With the coming of Intel's 512K-byte bubble memory module next year (and a 2M-byte version by 1986), it's likely that bubble memory will find wider acceptance in the personal computer market. How it will be implemented, however, is a subject of sometimes heated discussion. As a replacement for RAM? For floppy disk? For both?

To paraphrase an old saying, a computer is only as reliable as its weakest link.

	Shugart SA465 5¼-in. floppy disk	Computer Memories CM5000 5¼-in. hard disk	Intel 7110 bubble memory board
Capacity	320K bytes	12.7M bytes	256K bytes
Cost*	$315	$1,250	$450
Cost per kilobyte stored	$.98	$.10	$1.76
Volume**	100 cu. in.	190 cu. in.	18 cu. in.
Volume density (capacity/volume)	3.2K/cu. in.	66.8K/cu. in.	14.2K/cu. in.
Cost efficiency: cost ($) per volume density (K/cu. in.)	98	19	32

* Includes manufacturer's quantity (500 units) at manufacturer's prices, plus estimated cost for controller and associated electronics.

** Typical disk-based storage system includes disk drive volume and estimates for controller circuit boards.

Figures for capacity, cost and volume are based on typical storage systems.

Figure 3. Cost efficiency comparison of bubble and disk memory

The computer's relationship with any mechanical device (such as a disk drive) is bound to be difficult on occasion.

"Disk drives always crash at the most inopportune times," says Intel's Mike Eisele, head of marketing for bubble memory. "Not every day — but they are mechanical and they wear out.

"We see the bubble as a complement, the ideal second drive. You get the benefits of both worlds: cheap archival storage with the floppy and performance and reliability with the bubble."

This notion has met with resistance in some quarters. David Airel of Teleram feels that bubble memory is not a disk drive replacement, if only from a cost performance basis.

But he admits that drives are nearing the end of their innovative period: "Drives have been around for nearly 15 years. It's a mature technology, and a lot of major breakthroughs have been made. I don't know how many are left to be made. Bubble memory is young. How far it can go is still unknown."

For Rick Ostrow, chief engineer and developer of a bubble memory board for the IBM Personal Computer for MPC Peripherals, it's a matter of bubble memory finding its own niche. "The real question," he says, "is whether the floppy market is going to be there in the future. The hard disk is quickly replacing it.

"There's a 5M-byte cartridge system that costs $600 for the drive and $30 for the cartridge. That's going to replace the floppy if anything does."

Whatever the issues, bubble memory is apparently here to stay. How it will reach the personal computer user is still not clear. This is attributable in part to IBM's shifting commitments to bubble memory.

IBM was one of the first computer manufacturers to show an interest in bubble memory. Until last year, the company maintained a number of research labs dedicated to this technology.

There is talk of removable bubble cartridge systems and 125M-byte bubble devices.

But in the words of a former IBM engineer, the company is "rather schizophrenic." Technical innovation has given way in the past decade to marketing innovation.

"They take a flinty-eyed look at what you do," says the same engineer. "It can be rather frustrating. You can go to them and say, 'Look at what we have. It's much better than what we're using.' And they will ask if it will work for five years and meet a maintenance schedule, and so on. IBM is not on the leading edge. They don't like their customers to do their product testing."

A survey of IBM marketers, product managers and researchers indicates that something is going on behind the usual "no comment." Bubble research is apparently continuing at some company labs.

Despite some unresolved cost questions, the future of bubble memory looks promising. No one is yet ready to proclaim that it will replace floppy disks or RAM.

There is talk of removable bubble cartridge systems, 125M-byte bubble devices and other developments. One thing is certain: There will always be a need for fast, reliable memory, especially as computers become more gregarious devices for communications as well as information management.

Of course, one never knows in exactly what direction all of this will lead us. But in the volatile world of computers, it's always nice to have something nonvolatile to hold on to.

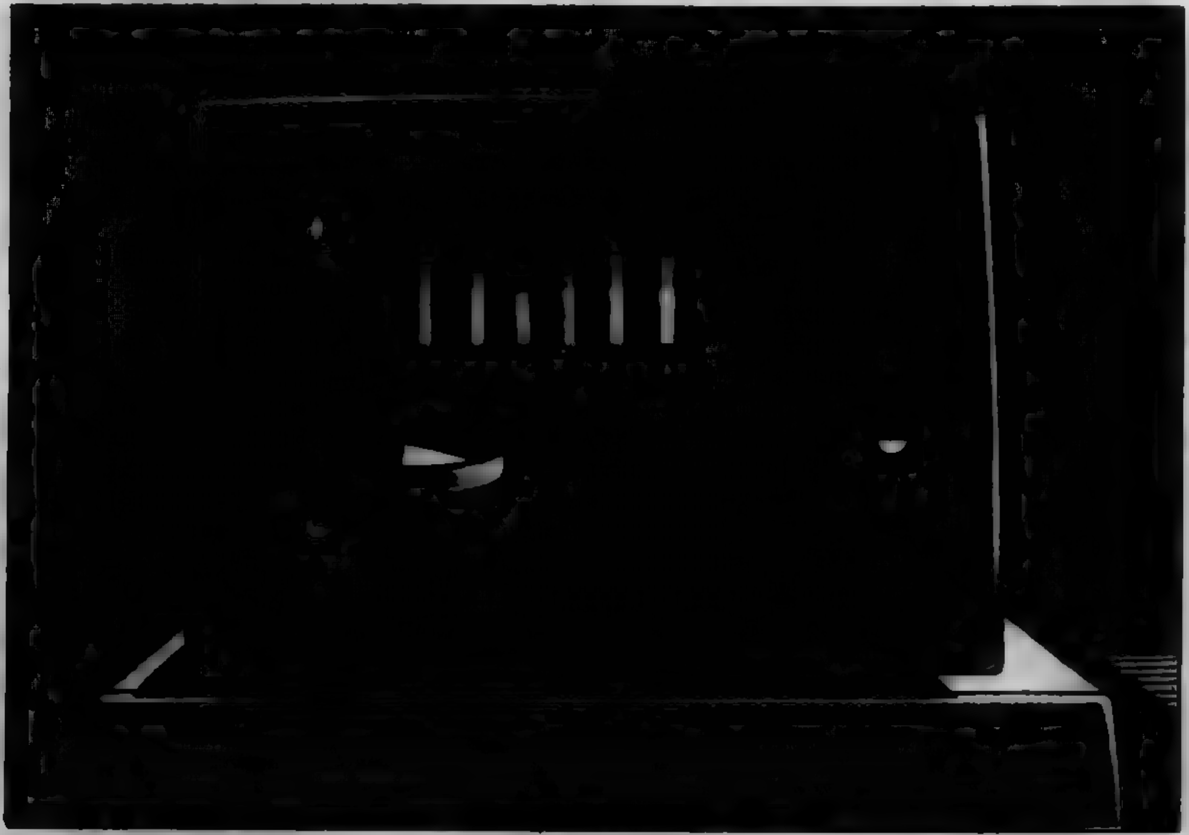
Boeing puts mainframe decision support on your desk with a difference you can see.



Now you can have large-scale decision support at your fingertips. Our Business Management Workstation combines the IBM® PC XT/370 with compatible mainframe power and our proven EIS® (Executive Information Services) software. The result is comprehensive, integrated decision support with mainframe capabilities — on your desktop.

Boeing takes another unique step, too. We equip every workstation with color graphics. You won't find this impressive capability on the standard IBM PC XT/370. It's one of the extras you get only from Boeing, an IBM Value-Added Dealer.

Of course, the PC XT/370 is itself an amazing machine. With its virtual memory capabilities, you can handle modeling and reporting locally. You can analyze and project events with expanded functionality previously reserved for only the largest computers. Yet you have the convenience and response of your own microcomputer.

Meanwhile, your decision support can take full advantage of mainframe capabilities. You can quickly access your data base on our MAINSTREAM® remote computing service with full compatibility. And you can easily transfer applications and files without the complications traditionally associated with micro/mainframe links.

The software expertise of Boeing and the most advanced personal computer ever offered by IBM are joined to give you unprecedented decision support . . . with solutions that are graphically visible.

For more information on our Business Management Workstation or the location of a sales office near you, call toll-free 1-800-447-4700. Or write BOEING COMPUTER SERVICES, M.S. CV-26-19B, 7980 Gallows Court, Vienna, Virginia 22180.

Kodak to sell net

New division to market service

By John Dix
CW Staff

ROCHESTER, N.Y. — Eastman Kodak Co. announced here recently its intent to resell capacity on its nationwide internal network to the top 5,000 U.S. businesses.

The primary thrust of Eastman Communications, a new corporate division, will be to market enhanced data communications services, although voice support will also be available, according to Lester G. Miller, general manager of the division. Kodak will tap the excess capacity in its network to offer the new services and add network capacity when and where demand warrants, Miller said.

Kodak is one of 23 corporations using AT&T's Enhanced Private Switched Communications Service, which is a specially tariffed service that enables corporations with the traffic requirements to share AT&T network switches and trunks. With its new services, Kodak essentially will be allowing users to access this network in its name.

To access the 17-city Kodak network, customers will use separately procured local private lines and, for data services, the necessary communications hardware, such as modems.

Initially, the service is aimed at users with point-to-point remote job entry (RJE) needs. More than simply a transmission service, the Kodak service includes communications software that, in this application, reduces the number of host sessions required, removes operator intervention and ensures low data-error rates.

Software will be made available for all major IBM computers — from its Personal Computer to its mainframes —

Bypass threatens health of local phone companies

By James Connolly
CW Staff

WASHINGTON, D.C. — More than 35% of local telephone company revenues are vulnerable to bypass, which poses a significant threat to the local companies' economic viability, according to the U.S. Telephone Association (USTA).

The USTA, in a recent filing with the Federal Communications Commission, cited a survey of local telephone exchange companies that indicated $850 million, or 35.9% of their $2.36 billion monthly access revenues, are vulnerable to bypass.

The USTA, which represents the local companies, said the business customer base is particularly endangered, with a 40.5% vulnerability rate, compared with a 21.2% rate for residential customers.

The study said that under current pricing, long-distance customers with more than 20 hours of toll usage per month could generally save money by directly accessing interexchange carriers. It noted that when a customer reaches 1,200 minutes of toll use per month, or roughly $420 of toll charges, the tariffed price of switched access begins to exceed that of dedicated facilities.

"Additionally, as resellers and [private branch exchange] suppliers begin to aggregate smaller individual users into larger user groups, one must expand the analysis to consider residential and business customers with toll bills greater than $25 per month but less than $420. Furthermore, one must be aware that other bypass alternatives provided by nonregulated vendors are available for less money than tariffed dedicated facilities," the report said.

The report was compiled using questionnaires mailed to all U.S. local telephone exchange companies in order to estimate the potential magnitude of access revenue losses resulting from the uneconomic recovery of non-traffic-sensitive costs. The USTA said usable responses came from companies representing 77% of all U.S. access lines.

See USTA page 71

Concord Data Systems adds IEEE token bus net starter

WALTHAM, Mass. — Concord Data Systems, Inc., one of the participants in the General Motors Corp. manufacturing automation protocol demonstration at the National Computer Conference '84 this year, has announced a local-area network starter system for evaluating an IEEE 802.4 standard broadband token bus network.

Token/Net, according to Concord Data Systems, is the only network available that implements the IEEE 802.4 standard on broadband cable. It reportedly gives users hands-on experience with the network implementation that GM selected for the manufacturing automation protocol used in the NCC demonstration.

The Token/Net starter system includes four Token/Net Interface Modules (TIM), a translator head end and a broadband cable kit. Each TIM is said to contain a radio frequency modem operating at 5M bit/sec, a media access unit implementing the IEEE 802.4 token-passing access method and a control unit providing TIM management functions and the user interface port.

Each node includes from four to 12 ports. A four-node starter system is $12,000 to $18,000, depending on the number of ports.

Concord Data Systems is located at 303 Bear Hill Road, Waltham, Mass. 02154.

Micom Systems launches 3270-emulating converter

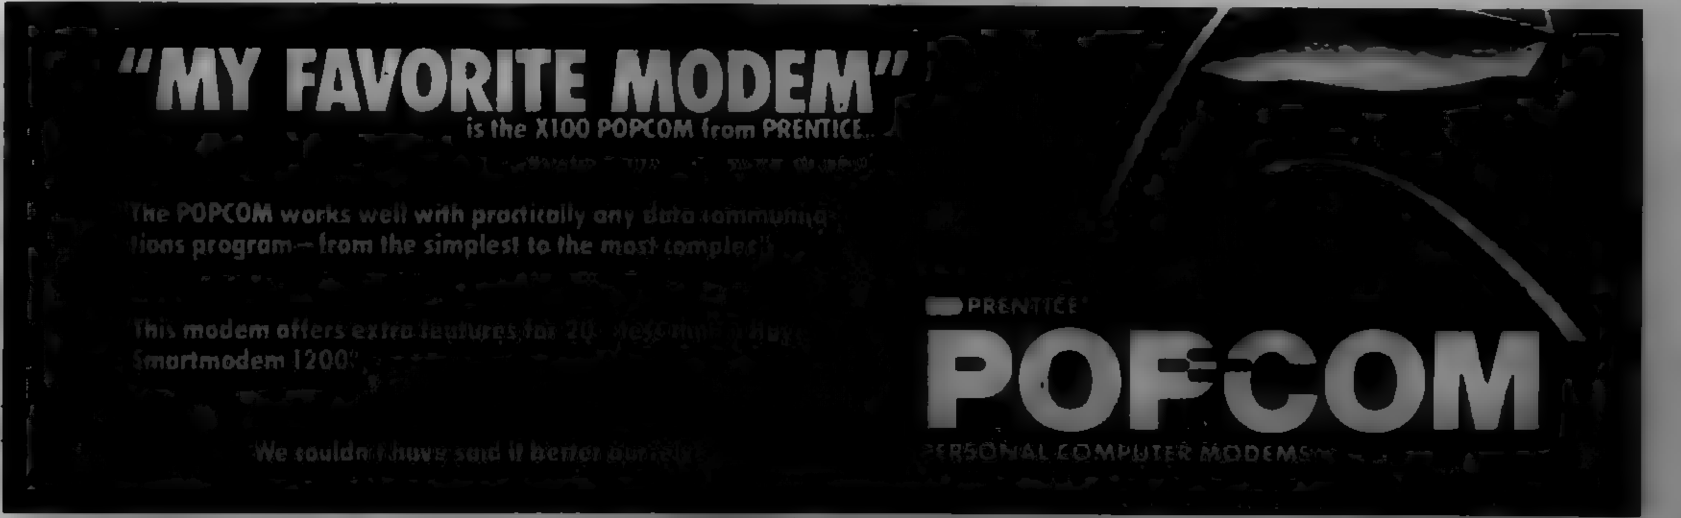
CHATSWORTH, Calif. — Micom Systems, Inc. has introduced a 16-channel protocol converter that is said to emulate all standard IBM 3270 functions, enabling asynchronous Ascii terminals and personal computers to access IBM mainframes as IBM 3270-type devices.

The 16-channel Micro7400 is said to appear to the host as an IBM 3274 Model 61C Cluster Controller communicating in either bisynchronous or Systems Network Architecture/Synchronous Data Link Control protocols. Attached devices reportedly act as IBM 3278 display stations, IBM 3279 color display stations or IBM 3287 printers.

The product also features automatic logon, inbound priority levels, banner and broadcast messages and security features, according to the company.

The 16-channel Micro7400 also is said to allow switching between two IBM hosts or between an IBM host and up to eight asynchronous computer ports. Like smaller Micro7400s, the 16-channel version is available with matched integral modems operating at 2,400, 4,800 and 9,600 bit/sec. It costs $5,650.

Micom Systems is located at 20151 Nordhoff St., Chatsworth, Calif. 91311.



"MY FAVORITE MODEM"
is the X100 POPCOM from PRENTICE...

The POPCOM works well with practically any data communications program — from the simplest to the most complex...

This modem offers extra features for 20 [illegible] Smartmodem 1200...

FINALLY. HELP FOR THE DATA CRAZED.

Introducing Cypress,® Cedar,™ and Juniper.™ Three fast, friendly, infinitely applicable desktop ideas from ROLM.

It comes as no surprise that people react to technology differently. Dyed-in-the-chip techies thrive on it. True non-believers avoid it instinctively.

Now you can please all of the people all of the time. Honest.

Say goodbye to complicated log-on codes. Just push a button and—whoosh!—travel all the way to a data base, talk to a mini or access your IBM mainframe.

Say hello to speakerphones, phone books, message takers and calculators. Built right in.

If you want to take snapshots of data in your mainframe, there's Cypress. It's as easy as Point & Shoot. It's a smart little ASCII terminal integrated with a fully-featured digital phone.

Need a 512 KB, fully IBM-compatible PC that runs programs like pfs:graph,™ the IBM Assistant Series,™ 1-2-3,™ and lets you mini-network through your phone line? Cedar's the one.

Already in love with your IBM®PC or XT but crave the affections of Cypress? Ask for Juniper. Its one slot adaptor card lets your system keep growing. And growing.

Of course, only ROLM has Cypress, Cedar and Juniper. Because only ROLM has the system to run them on. At its heart is the CBX II, a breakthrough communications controller that manages voice and data over standard telephone wire. Simply, brilliantly and cost effectively.

And ROLM has the technical edge, the operational track record and the worldwide service and support organization to please even the toughest customer.

So phone ROLM. High tech. Not high anxiety.

ROLM

Trademarks: pfs:graph—Software Publishing Co., IBM Assistant Series—International Business Machines Corp., 1-2-3—Lotus Development Corp.

CONTROLLERS

RAYMOND G. LORBER, INC.
Systems 34/36/38
Communications Controller

Raymond G. Lorber, Inc. has announced its Systems 34/36/38 Communications Controller, a front-end system designed to enhance the IBM System/34, 36 and 38 communications environment.

The product, consisting of a specially configured IBM Series 1 minicomputer and a CWA 525X Data Concentrator from CWA Communications, Inc., reportedly adds 25 lines to host systems and reduces polling overhead for the host, allowing different devices in a cluster to access different hosts. The CWA 525X concentrator is said to support nonreturn-to-zero line coding, 25 IBM Synchronous Data Link Control lines per concentrator, attachment of 200 control units, line speeds up to 11K bit/sec and RS-232 and V.35 interfaces.

A typical 20-line configuration costs about $110,000, according to the vendor.

Raymond G. Lorber, 101 California St., San Francisco, Calif. 94111.

VOICE/DATA COMMUNICATIONS

VMX, INC.
Voice Message Exchange enhancements

VMX, Inc. has enhanced its Voice Message Exchange voice store-and-forward systems.

The features include the ability to code messages for delivery up to 31 days after the message is recorded; autoscan, which lets recipients listen to just the names of their callers; an old/new message queue feature that identifies the messages received after the last check of the mailbox; and autoplay, the company said.

The enhancements will reportedly be standard in new systems and will require hardware modifications costing about $7,500 in some existing systems. Typical VMX systems cost from $102,000 for 400 users to $535,000 for 8,000 users.

VMX, 1241 Columbia Drive, Richardson, Texas 75081.

PROTOCOL CONVERTERS

INNOVATIVE ELECTRONICS, INC.
MC-80/600-1

Innovative Electronics, Inc. has announced a communications processor that is said to convert a Digital Equipment Corp. VT100 or compatible terminal into a full-function IBM 3277 or IBM 3278 terminal.

The MC-80/600-1 reportedly emulates an IBM 3274-51C running Support Level A and lets the terminal communicate with the IBM host using the IBM Binary Synchronous Communications protocol. According to the company, the processor allows full screen mapping and virtual screen sizes of 480,

HP machines get AT&T PBX use

AT&T Information Systems and Hewlett-Packard Co. have announced the joint certification of HP computers and data terminals for use with the AT&T System 75 private branch exchange.

The companies said that as a result of joint testing, current HP 3000 business computers, HP Touchscreen personal computers and HP data workstations have been certified for use with the System 75. A similar certification was issued for the AT&T System 85 last January.

The certification was intended to assure customers that HP equipment will connect over AT&T Information Systems' twisted-pair wiring to be switched by the System 75. It is said to provide end-to-end connectivity for integrated voice and data applications and to support asynchronous protocols at up to 19.2K bit/sec.

More information on the joint certification is available from AT&T Information Systems, 100 Southgate Pkwy., Morristown, N.J. 07960.

UNIX SYSTEM V. FROM AT&T. ON TOP

Is your company's computing system an unmanageable muddle of isolated workstations and departmental computers?

You need a flexible means to integrate your system and get it under control. UNIX System V from AT&T.

It's another reason why good business decisions are based on UNIX System V.

UNIX System V can help you regain control of your company's system. Its flexibility lets you organize and expand your computing system for maximum efficiency.

And it protects your investment in hardware and software.

More freedom. More control.

UNIX System V is virtually hardware independent. It gives you the freedom to combine equipment from a variety of vendors. Even if the machines are of different generations.

You won't waste money rewriting software every time a new computer is added on. UNIX System V is easily adapted to a wide range of computers. From micros to mainframes. Including AT&T's range of 3B Computers.

Don't worry about your stand-alone personal computers running on MS-DOS.* AT&T's PC Interface allows you to integrate your current machines into your system without costly disruptive change.

And, our COMMKIT™ Software links UNIX System V to the major networking protocols for data communications between computers based on UNIX System V and those that are not.

UNIX System V can support a number of users doing varied tasks at the same time. All sharing a central processing unit and peripherals. All benefiting from a larger base of information. All working as a manageable whole. All contributing to bottom-line cost savings because equipment and computing

960 and 1,920 characters; it supports all screen formatting capabilities.

The unit provides up to 16K bits of read-only memory, 16K bytes of random-access memory and two serial communications ports.

The basic unit costs $1,295, while an additional port costs $200, according to [redacted]

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

SOFTWARE

COMMUNIQUE CORP.
CQ-3780; CQ-3770-SNA

Communique Corp. has introduced two software products designed to let microcomputers communicate with host computers using IBM's 2780/3780 bisynchronous protocol and to emulate IBM's 3770 communications terminals using Systems Network Architecture (SNA)/Synchronous Data Link Control.

CQ-3780 and CQ-3770-SNA reportedly permit full error-checked data file transfer at speeds ranging from 1,200 bit/sec to 56K bit/sec.

They feature a built-in text editor; local disk operation; simultaneous redirection of incoming data to disk, console, card punch or printer; adaptation to host or remote status; and built-in password security for public sites.

CQ-3780 is priced at $500, and CQ-3770-SNA costs $750, the vendor said.

Communique, 1535 Killearn Center Blvd., Tallahassee, Fla. 32308.

MULTIPLEXERS/ MODEMS

GANDALF DATA, INC.
SMLDS 349 enhancement

Gandalf Data, Inc. has announced that its synchro[redacted] been enhanced for multipoint operation and that it has lowered the modem's price.

SMLDS 349 reportedly is an autoequalized unit with an operating range from three miles at 19.2K bit/sec up to six miles at 2,400 bit/sec. It is powered from an RS-232C, CCITT V.24/V.28 interface via data and control signals and plugs directly [redacted]

It is said to be compatible [redacted] synchronous, point-to-point and multipoint, full-duplex operation and operates at switch-selectable synchronous speeds of 2,400, 4,800, 9,600 and 19.2K bit/sec in [redacted]

The company said the list price has been lowered from [redacted]

Gandalf Data, 1019 S. Noel Ave., Wheeling, Ill. [redacted]

GANDALF DATA, INC.
LDM 408, LDM 418

Gandalf Data, Inc. has announced two 4,800 bit/sec leased-line modems designed for transmissions between telephone exchanges within a 200-mile range.

The synchronous LDM 408 and the asynchronous/synchronous LDM 418 are said to provide binary serial, point-to-point or digital multipoint data transmissions over four-wire, voice-grade [redacted]

The modems reportedly feature autoequalization, signal processor implementation, diagnostic loopbacks, a test pattern generator and error detection. In stand-alone configurations, a dual-channel capability is said to allow greater applications flexibility. Users can opt for a single channel at 4,800 bit/sec or two channels at 2,400 bit/sec, according to Gandalf.

The stand-alone versions, the LDM 408 and the LDM 418, cost $795 and $895. Rack-mount units, the RM 3408 and the RM 3418, cost $725 and $825.

Gandalf Data, 1019 S. Noel Ave., Wheeling, Ill. [redacted]

See [redacted] page 72

USTA from page 67

The USTA submission also noted, "If the national access revenues vulnerable to bypass must be recovered from end users through a flat monthly charge, local exchange rates rise by $7.63/mo per line. On the other hand, if this revenue shortfall is recovered from the interexchange carriers, the common line charge increases by $0.059 per access minute, further exacerbating the bypass problem."

The USTA is located at 1801 K St. N.W., Washington, D.C. 20036.

costs come down while your output and productivity go up.

A standard that's here to stay.

UNIX System V is backed by the full resources of AT&T. We're committed to seeing that it does the best possible job for your company —now and in the future.

All future software releases will be upwardly compatible. And designed to solve your business needs.

Our Independent Software Vendor Support Program will meet the demands of business with a complete line of high-quality applications software. Rest assured that your choice of a computing system based on UNIX System V is a smart, safe one.

MODEM

from page 71

NOKIA-KINEX CORP.
48/208AB Model 1

Nokia-Kinex Corp. has introduced an AT&T 208AB-compatible modem intended for use in synchronous networks and by personal computers using a synchronous protocol.

The 48/208AB Model 1 offers full- or half-duplex synchronous operation at 4,800 bit/sec on leased or dial-up lines, respectively, according to the vendor.

Users reportedly select between the AT&T 208A and AT&T 208B modes through two front-panel switches.

Features reportedly include unattended autoanswer, autodisconnect, autodialer compatibility, front panel access to configuration strapping, low power consumption, small size and light weight.

The modem's diagnostics amount to a small net management system, the vendor said, including features such as a line-quality display, display of all connector leads, analog, local and digital loopbacks for problem isolation, self-test, built-in test pattern generator and integral bit error-rate test.

Price for the modem starts at $1,700, according to the vendor spokesman.

Nokia-Kinex, 6950 Bryan Dairy Road, Largo, Fla. 33543.

GENERAL DATACOMM INDUSTRIES, INC.
GDC Station Clock Facility

General Datacomm Industries, Inc. has announced its GDC Station Clock Facility, which reportedly locks all stations that are in a synchronous network into a central clock.

The facility reportedly can serve as master clock itself or lock onto an external timing source, such as that used in AT&T's Dataphone Digital Service.

It provides a timing reference for the entire multiplex network, a vendor spokesman said.

The GDC Station Clock Facility was designed for use in networks using General Datacomm's Megamux multiplexer, according to the vendor spokesman.

A 16-port facility is priced at $5,940, the spokesman said.

General Datacomm, Middlebury, Conn. 06762.

KODAK

from page 67

and Digital Equipment Corp.'s family of PDP-11 and VAX products, Miller said. The RJE service includes the following features:

- The normal RJE limit of seven attempts to establish a session between devices is extended to 49, increasing the number of connections achieved in a given time, Miller said.
- A single session can be used to transmit and receive, alleviating the need to take down and reestablish a conversation to turn around the direction of transmission.
- RJE record lengths can be any size, rather than the usual record size limit of 80 to 132 bytes.
- Sessions can be established automatically, eliminating the need for operators to create and monitor sessions, Miller said.

All communications will be done synchronously, typically at 4,800 or 9,600 bit/sec, through either IBM's Binary Synchronous Communications (BSC) or Synchronous Data Link Control protocols, with conversion from one to another handled automatically by the host software. To use the service with DEC equipment, a separate licensed software product would have to be procured from DEC that would provide compatibility with the BSC protocol.

While the particulars of service pricing are still uncertain, Miller outlined the rate structure, which will include an installation charge after the first two sites, and carry a charge per kilopacket transmitted. Any installation charges will be structured in such a way as to enable users to recover this cost through service use.

Eastman Communications will offer voice support in much the same way as it offers data — using a leased line to connect a private branch exchange into the network — and will charge users on a per-minute basis. However, this support will also require users to update their least-cost routing software. This would enable users to call over the Kodak network to a city close to the call's destination, where it would be bumped into the public-switched network.

THE 3180 WAS BUILT TO STAY PUT. THE 7800 WAS BUILT TO PUT ANYWHERE YOU WANT IT.

Obviously, the terminal on the left is the IBM® 3180. And on the right, the CIE-7800.

Once you buy a 3180 for data entry, it will always be a terminal for data entry. So it stays put.

But with the CIE-7800, you get a "soft" reconfigurable keyboard. So you can use it for data entry or as a typewriter or even for APL applications. That way, you can move a 7800 from one department to another. Anywhere you want it.

And easily.

The CIE-7800 weighs in at 26 pounds. The 3180 is nearly twice as heavy, tipping the scales at 48 pounds.

And the CIE-7800 won't take over your desk like a 3180 does. The CIE-7800 is about 40% more compact and space saving.

Another major advantage is that the CIE-7800 is available with alternate concurrent personalities, while the 3180 is not. At a touch of a key, the CIE-7800 can alternate between IBM 3270 or DEC VT100® or HP 2622A or IBM 3275/3276-2.

And there's also the convenience of a screen printer port on the CIE-7800 for printing right where you sit. So you don't have to take the long walk for hard copies that you do with IBM.

CDS Data Center tools link CAE, business tasks

SANTA CLARA, Calif. — A five-year-old firm here recently announced a family of printers and terminals that reportedly allows computer-aided engineering (CAE) capabilities to be merged with spreadsheet, word processing and graphics applications running under any IBM microcomputer, including the Personal Computer AT.

Corporate Data Sciences, Inc. (CDS) reportedly is aiming its Data Center product line primarily at mechanical design engineers in large businesses, such as aerospace and automotive firms.

For CAE purposes, Data Center comes with a 17-in.-high monochrome video terminal that provides 1,024- by 1,024-pixel resolution and displays both text and schematics, according to Don Pate, CDS' marketing vice-president.

The terminal is also compatible with IBM's Personal Computer family and is supplemented by an assortment of application software packages that take advantage of the personal computers' ability to do spreadsheets, word processing and other standard office functions, the company said.

This union of an engineering-like display screen with a business-oriented personal computer allows designers to create technical drawings, draft reports, manage budgets and do all of their other major computing tasks from the same system, according to CDS.

Hard-copy output options

In addition to incorporating a video display monitor, CDS said the Data Center design system provides two options for creating hard-copy output — a 240 dot/in. matrix printer and a 300 dot/in. laser printer.

Prices for the Data Center, which its developer plans to sell directly to large end-user organizations, will typically range from $8,000 to $10,000 per configuration, Pate said.

CDS is headquartered at 2560 Mission College Blvd., Santa Clara, Calif. 95050.

Board boosts 3080 memory

WALTHAM, Mass. — Cambex Corp. has announced an add-on board that uses 64K-bit or 256K-bit memory chips to expand the storage capacity of the IBM 3080 X models by 8M or 16M bytes.

IBM does not yet offer 256K-bit chips for its 3080 series processors, but analysts expect an announcement to that effect soon. A Cambex spokesman said the 256K-bit chip is supplied by a Japanese firm, which he declined to name.

The Cambex product, Stor/8000, is intended either to replace or to expand main memory for the newer X models of IBM's 3081, 3083 and 3084 processors, the firm said. Stor/8000 is available in either 8M-byte or 16M-byte versions. The product plugs into a Cambex backplane with its own power supply and uses IBM circuitry and signals. No external devices or external interconnect cables are required because the memory is located within the mainframe.

See CAMBEX page 80

McAuto launches CAD-engineering systems

ST. LOUIS — McDonnell Douglas Automation Co. (McAuto) has announced two turnkey systems said to tie computer-aided design (CAD) to civil and structural analysis software for engineers with Digital Equipment Corp.'s Microvax-1 CPUs.

The Microvax-1 configuration includes 2M bytes of main memory, 140M bytes of fixed disk storage, 100M bytes of cartridge tape, floppy diskettes, a local printer, 13-in. color graphics workstation and asynchronous communications.

Hardware options include a second workstation, higher resolution 19-in. color and monochrome raster workstations, plotters, hard-copy units and an interface to an Ethernet local-area network.

Map drawn with McAuto CAD software

The price of the civil package, including the Microvax configuration, McAuto's General Drafting System (GDS), Basic language programming capability, McAuto's Coordinate Geometry/Roadway Analysis and Design (Cogo/Roads) program and integration software, is $115,000. The price for the integrated structural package, including the Microvax configuration, GDS, Basic, Cogo/Roads and integration software, is $120,000.

A communications package is available to support Prime Computer, Inc.'s Asynchronous Network for the DEC Microvax-1, VAX-11/750 and VAX-11/780 for $2,000, the company said.

McAuto is also offering an interface between GDS and Department of Energy-2 Loads, an energy analysis system said to enable mechanical engineers to analyze the thermal performance of buildings and heating, ventilating and air conditioning installations. The interface is provided at no charge to GDS buyers, the vendor said.

More information is available from McAuto, P.O. Box 516, St. Louis, Mo. 63166.

SHOP TALK/GALE AGUILAR and LEN HALIO

Terminal holds its own in office mart

The majority of computer applications today not only begin at a terminal, they depend on one from start to finish. Terminals will continue to play a leading role in the office of the future despite the seeming encroachment of workstations and microcomputers.

Although devices such as the bar-code reader and the automatic teller machine are classified as terminals, the word usually means a VDT — specifically an interactive VDT.

A VDT's interactivity is its most important attribute. Today's VDTs were not designed for the computer system , but for the human being using the system. That trend will continue as time goes on. In fact, thanks to the developing field of artificial intelligence, tomorrow's VDT may be able to observe how each of us works and then adapt itself to our individual styles. The day may even come when we will direct the VDT to do our bidding not with our typing fingers, but with our eyes.

The VDT began as a hybrid of the teletype, with its typewriter-like keyboard, and the television set. Early dumb terminals could not process the information being entered; data had to be sent to and from the host processor. The inclusion of the microprocessor started the dumb terminal on the road to oblivion. Once VDTs were endowed with some intelligence, they could perform vari-

IBM user concerns cover wide range of systems issues

By Kathleen Burton
CW West Coast Bureau

SAN DIEGO — IBM users trying to plot their future systems strategies appeared to be concerned with IBM over a number of issues ranging from what some perceived as ambiguous IBM solutions to a lack of integration among IBM product families.

So claimed Robert T. Fertig, president of Enterprise Information Systems, Inc., during a seminar at the sixth annual Enterprise Information Systems Forum held here recently

Using results gleaned from his annual survey of over 200 IBM mainframe users, Fertig said other frequently voiced concerns included IBM's nebulous operating system strategy, plans for

See FERTIG page 80

Superminis take on traditional CPU jobs

By Kenneth Ross
Special to CW

There is a growing industry trend toward the use of superminicomputers dedicated to vertical applications or functional areas in medium- to large-size companies.

The best known examples of this are manufacturing, engineering and office automation, but the increased capabilities of these machines now make them suitable for applications such as financial accounting and planning — applications that formerly were run only on mainframes.

As this trend accelerates, the office of the future will most probably consist of personal computers used for individual processing functions, superminis running applications that involve information that needs to be shared interactively and mainframe computers for batch- and operations-oriented, large-scale applications. Today's data communications techniques make it easy to interconnect all of these kinds of computers so that the information that they process can be shared.

Superminis, as opposed to regular minis, can be defined as 32-bit, multiuser systems that use sophisticated operating systems. Since the introduction in 1977 of the first of these machines, Digital Equipment Corp.'s VAX-11, they have evolved from dedicated scientific processors to full-scale commercial computers. Today's supermini has the flexibility and power of traditional mainframes and the ease of use and interactivity of traditional minicomputers.

Some of the characteristics of superminis today include:

- Power. The processing speeds, disk storage capability and I/O throughput make today's superminis more powerful than yesterday's mainframes.
- Flexibility. Most superminis offer clustering capabilities for sharing disks and processors, advanced networking so that information can be easily transferred between processors both locally and remotely and a compatible product line that ranges from a micro- to mainframe-size machine so that customers can choose how much processing power and data storage is needed for each function.
- Interactivity. The single most important advantage of interactive computers is their ability to give the user immediate feedback in response to an event.

Until recently, commercial software was not available that reflected the true power of mainframes but which also offered the interactivity of minis. Within the last couple of years software that has been designed from the ground up for the supermini environment has become available. Some of the characteristics of this software include:

- Interactivity. Software designed for superminis should be interactive for all functions, including data entry, updating and reporting.
- Extensive features. Supermini software designed for medium- to large-size companies must still contain the extensive features found on successful mainframe software products. These features include large file capacities and flexible reporting capabilities.
- Ability to provide the total solution. Until recently, traditional transaction-oriented applications (such as accounts payable) were done on mainframes, while interactive applications like financial modeling were done on time-sharing services or on micros. The supermini provides a technical environment in which both financial accounting and planning solutions can together be implemented and integrated, providing the user with a single information processing capability, common data bases and a consistent user interface.
- Micro-to-supermini links. Today, micros are used extensively in all areas of financial management, and a micro-to-supermini link is a necessary part of any software package, as the micro-to-mainframe link is in its environment.

Automating functions

An example of how superminicomputers can be used to automate an entire function can be found in the financial management area. Today's financial manager in a medium- to large-size company needs traditional transaction-oriented systems such as general ledger, financial reporting, accounts payable and accounts receivable.

These applications have tended to be batch mainframe applications, and the software was either developed in-house or purchased from one of the three or four top mainframe financial software vendors.

These same financial managers have also needed interactive decision support software capabilities for performing tasks such as modeling, forecasting and budgeting. This interactive computing was first done on time-sharing computers but has recently moved onto microcomputers.

Ross is president and founder of Ross Systems, Inc. in Palo Alto, Calif., a supplier of financial management software for Digital Equipment Corp. VAX superminis.

The four most important days of the new year for telecommunications users!

START "THE YEAR AFTER DIVESTITURE" OFF RIGHT — WITH COMMUNICATION NETWORKS '85.

This is it — America's *national* telecommunications forum — the first, the most comprehensive and the most important conference and exposition of the year. It's the Seventh Annual COMMUNICATION NETWORKS Conference & Exposition, with:

- the *largest* conference program in the industry — some 80 essential seminars, topics and presentations
- the leading industry experts, including the renowned *James Martin, Arch McGill,* FCC Commissioner *Dennis Patrick*, and some 200 other speakers and panelists
- the *biggest* exhibit in COMMUNICATION NETWORKS history, with over 200 exhibitors and 750 booths, so you can see everything the technology leaders have to offer in '85.

BEGINNING AND EXPERIENCED TELECOM PROFESSIONALS WILL BENEFIT

Whether you or your staff have been in the telecommunications field for one year or ten, you'll find COMMUNICATION NETWORKS '85 of major value. In fact, what you learn here will have a significant impact on how effectively you deal with the constant changes in telecommunications in 1985.

FEATURED SPEAKER
JAMES MARTIN
MONDAY AFTERNOON, JAN. 28, 1985.

James Martin is widely regarded as the computer industry's foremost authority on the social and commercial impact of computers/communications. Author of 31 best sellers and a Pulitzer Prize nominee, Martin has lectured nationally and is known for his uncanny predictions. He will challenge your thinking and give you insights you can use now.

Attend any of the 12 introductory or advanced seminars on Monday, January 28 and, as a special bonus, you'll hear the dynamic James Martin at a special late afternoon lecture. Then choose from more than 70 conference sessions, including user-oriented topics chaired by Association of Data Communications Users members. See the latest products and services on exhibit, relax in exhibitor hospitality suites and enjoy all the attractions of Washington, D.C.

REGISTER BY DECEMBER 14, 1984 AND SAVE $50 ON EACH REGISTRATION.

Don't let anyone you know miss out on 1985's most important telecommunications event. Come for all four days, or any days you prefer, to the largest and best COMMUNICATION NETWORKS Conference ever. Register for three or four days by December 14, 1984 and save $50 on each registration.

CALL TODAY, OR SEND THE COUPON BELOW TO REGISTER.

SYSTEMS & PERIPHERALS

TURNKEY SYSTEMS

DAISY SYSTEMS CORP.
Personal Logician AT

Daisy Systems Corp. has announced the Personal Logician AT computer-aided engineering (CAE) system, based on the IBM Personal Computer AT and featuring Daisy Systems' graphics subsystem.

The system includes design entry capabilities and the Personal Daisy Logic Simulator for design verification. The system is said to offer twice the mass storage capability of the firm's system based on the IBM Personal Computer XT.

The Personal Logician AT features Intel Corp.'s 80286 microprocessor, a 20M-byte hard disk drive and compatibility with Xerox Corp.'s Ethernet local-area network. Daisy Systems' graphics controller and monitor offer 1,022- by 840-pixel resolution.

The price for Personal Logician AT with 640K bytes of random-access memory, Daisy Systems' graphics subsystem, a 20M-byte hard disk drive and 1.2M-byte floppy disk drive is $25,000, the company said. The price for an add-on package for Personal Computer ATs is $20,000, the company said. A color version of the system will be available in the first quarter of 1985 for $10,000, the company said. The Ethernet compatibility is optional for $2,500 per workstation, the company said.

Daisy Systems, 700 Middlefield Road, Mountain View, Calif. 94043.

PARAGON TECHNOLOGY CORP.
100AR

Paragon Technology Corp. has announced the 100AR, a computer-aided design system for printed circuit board design applications. The unit is based on a Digital Equipment Corp. PDP-11/23+ minicomputer with four serial ports.

The 100AR 16-bit stand-alone workstation is an enhanced version of the 100A, which adds an autorouting capability and hard disk storage. The product has the capacity to design boards of up to 20- by 20-in. with up to 200 16-pin equivalent integrated circuits with 64 colors and layers. Screen resolution is 512 by 512 pixels, the vendor said.

Hardware includes the system console, keyboard and DEC VT100-type terminal, with a 14-in. color monitor, line printer, proprietary graphics board and digitizer tablet. Options include a 20M-byte Winchester disk drive, modem, magnetic tape unit, paper tape punch, digitizer table, pen plotter, uninterruptible power supply and workstation furniture, the company said.

The price for the 100A is $45,000, the vendor said.

Paragon, 2199 Norse Drive, Pleasant Hill, Calif. 94523.

PROCESSORS

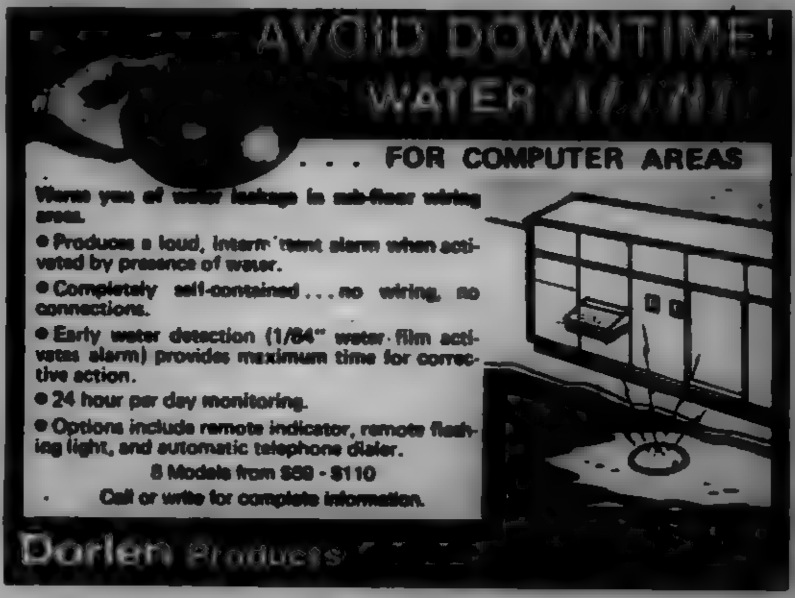
SIGNAL PROCESSING SYSTEMS, INC.
SPS 1000 With Dot Product Processor

Signal Processing Systems, Inc. has announced a dataflow multiprocessor system designed to provide continuous, integrated power and cross-spectral density processing at more than 1-MHz complex sample rates. The SPS 1000 With Dot Product Processor is said to provide integration processing of results without delaying fast Fourier transform operations. It reportedly features array multiplications, integrations, dot product and filter operations invoked by Fortran subroutine calls and is said to perform single, double and quadruple precision operations.

According to the vendor, the product interfaces multiple processors and I/O devices through smart memory and provides real-time system computation rates of up to 1.5 billion operations per second. Supported by a block diagram compiler, the byte-sliced system comes in 8-, 16-, 24- and 32-bit configurations.

It is priced from $65,000.

Signal Processing Systems, 223 Crescent St., Waltham, Mass. 02154.



AVOID DOWNTIME!
WATER ALARM
. . . FOR COMPUTER AREAS

Warns you of water leakage in sub-floor wiring areas.

- Produces a loud, intermittent alarm when activated by presence of water.
- Completely self-contained . . . no wiring, no connections.
- Early water detection (1/64" water film activates alarm) provides maximum time for corrective action.
- 24 hour per day monitoring.
- Options include remote indicator, remote flashing light, and automatic telephone dialer.

Why the time has never been better to get your own subscription to Computerworld.

FREE CLOCK WITH YOUR SUBSCRIPTION.

Subscribe to *Computerworld* now, and we'll send you this miniature, personal computer clock. Free. The clock displays the date, the hour, minute and second, and makes a handsome desktop piece for your office. And as we said, it's a gift from us to thank you for becoming a new subscriber to *Computerworld*.

51 ISSUES OF *COMPUTERWORLD*

In addition to the free timepiece, of course, you'll receive our regular 51 issues of *Computerworld*. So you won't have to wait for a co-worker's copy to keep up-to-date on what's taking place in the industry.

YOU'LL ALSO RECEIVE SPECIAL FOCUS ISSUES

As a *Computerworld* subscriber, you'll also receive our highly-acclaimed COMPUTERWORLD FOCUS issues — at no extra charge. Published once a month (except July and December), these bonus issues focus on a single topic. Here is a sampling: UNIX™, Office Automation, Microcomputer Software, Business Graphics, Applications Software, Manufacturing, Networks, Systems Software, Microcomputer Hardware. COMPUTERWORLD FOCUS helps you plan, purchase, and save money. And these bonus issues are sent only to *Computerworld* subscribers — it's like getting a subscription to a second magazine FREE!

As you can see, there are plenty of reasons to subscribe to *Computerworld*. So don't rely on someone else to lend you theirs. Be well-informed — with 51 issues of *Computerworld* plus the COMPUTERWORLD FOCUS issues — without having to wait.

Now you know why the time has never been better to subscribe to *Computerworld*.

UNIX is a trademark of AT & T Bell Laboratories

☐ Yes! Please enter my subscription for one full year (51 issues) of *Computerworld* at $44. Plus all 10 COMPUTERWORLD FOCUS issues at no extra charge . . . plus my FREE gift with my paid subscription. (Please allow 6-8 weeks for shipment of your free gift.)

TERMINALS

ITT TELECOM PRODUCTS CORP.
Infostation

ITT Telecom Products Corp. has introduced an integrated voice/data workstation said to enable users to access both voice and data simultaneously.

The Infostation consists of an executive telephone, full-duplex speakerphone, 9-in. CRT display, 300 bit/sec modem, typewriter-style keyboard and what the vendor calls a dashboard of 13 programmable keys. The programmable keys are said to offer users access to numbers dialed frequently or private branch exchange functions, the vendor said.

The workstation is said to offer a telephone directory and a log, calendar, scratch pad, electronic messaging and data communications.

Available in January, the unit will be priced between $1,100 and $1,200, the vendor said.

ITT, 3100 Highwoods Blvd., Raleigh, N.C. 27604.

TANDEM COMPUTERS, INC.
Integrated Bar Code/Magnetic Stripe Reader

Tandem Computers, Inc. has announced the Integrated Bar Code/Magnetic Stripe Reader option for its 653X terminals. The feature is said to allow users of Tandem Nonstop systems to enter machine-readable information directly from bar code labels and/or magnetically striped cards without having to use the terminal keyboard.

Three versions are available: the Model 6AIB integrated bar code reader, the Model 6AIM integrated magnetic stripe reader and Model 6AIC integrated bar code/magnetic stripe combination. The bar code options are said to support all standard codes, while the magnetic stripe options support Track 1 International Airport Transportation Association or Track 2 American Bankers Association standard codes.

Bar code and magnetic stripe readers transmit data to the terminal at 4,800 bit/sec, according to the vendor.

Prices are $1,295 for the integrated bar code reader option, $1,095 for the magnetic stripe option and $1,995 for the bar code/magnetic stripe combination, the company said.

Tandem, 19333 Vallco Pkwy., Cupertino, Calif. 95014.

INTERFACE...
FOR THOSE WHO SELL
EQUIPMENT THAT MANAGES
AND MOVES INFORMATION

If you sell products for
data communications,
information systems integration
or communications,
INTERFACE '85 is the place to exhibit.
Here are 3 good reasons:

The quality of the attendee.
High level decision-makers from Fortune 1000 companies, utilities, railroads, financial institutions, government, military, and other large-scale decision users attend this premier show. These are the people who influence or control the purchase of the kind of equipment you make. Their presence at INTERFACE tells you they represent real business potential.

INTERFACE is cost-effective.
Last year's attendance exceeded 12,000 and we're anticipating 15,000 in 1985. You'll meet real decision-makers — no tire kickers — because the people you meet at INTERFACE have the authority to specify and buy. You save time and expense by meeting with them at INTERFACE.

The prestigious INTERFACE conference.
The INTERFACE Conference helps prepare attendees to discuss their problems with you on the exhibit floor. Conference sessions are conducted by some of the industry's leading experts who address the latest issues and technological advancements that face the information/office systems integration/communications professional.

INTERFACE® '85

Thirteenth Annual Conference & Exposition · March 4-7 1985 · Atlanta, GA · Co-sponsored by BusinessWeek and Data Communications

To reserve exhibit space or for more information, call (617) 449-6600
or write INTERFACE '85, 300 First Avenue, Needham, MA 02194.

PRINTERS/PLOTTERS

VERSATEC, INC.
Model 430

Versatec, Inc. has announced an off-line plotting workstation, the Model 430, which supports electrostatic color and high-resolution plotting (200 and 400 point/in.) on Versatec plotters from California Computer Products, Inc. 921/925 tapes. The workstation performs all vector sorting and vector-to-raster conversion.

The Model 430 accepts seven Versatec data standard formats and supports all Versatec plotters. The workstation includes a microprocessor, 64K bytes of memory, video display, 24M-byte Winchester disk, magnetic tape drive and bipolar algorithmic processor designed for vector sorting and raster generation. An optional synchronous communications interface enables remote plotting.

The price of the Model 430 is $46,000, and the communications option is $3,000 when ordered with a workstation, the vendor said.

Versatec, 2710 Walsh Ave., Santa Clara, Calif. 95051.

IMAGEN CORP.
Imagen 12/300

Imagen Corp. has introduced a desktop laser printer said to be able to merge text and graphics on one page.

The Imagen 12/300 includes features such as page collation, page reversal, multiple copies facility and portrait or landscape printing, the vendor said. Interfaces supported include serial, parallel and the Ethernet local-area network. The 12/300 reportedly can print 12 page/min at a resolution of 90,000 dot/sq in. using dry toner and plain paper.

The printer is said to support a number of host computers, including those running AT&T's Unix operating system. It also supports document composition systems such as Bell Laboratories' Troff, the American Mathematical Society's Tex and Unilogic Ltd.'s Scribe, the vendor said. It also comes standard with emulators for daisywheel, line printer and Tektronix, Inc.'s Tektronix 4014, enabling the user to output file previously configured for those devices.

The price for the 12/300, including 20 fonts and the vendor's Impres language, is $19,950, the vendor said.

Imagen, 2650 San Tomas Expwy., Santa Clara, Calif. 95052.

GENICOM CORP.
Printer enhancements

Genicom Corp. has announced a series of enhancements for its 3000 and 4400 series of printers.

For the 3000 series of personal and small business dot matrix printers, the company made software changes intended to make the printers compatible with all IBM Personal Computer systems. The changes include adding IBM Personal Computer graphics capabilities to the Models 3014 and 3024 and Epson America, Inc. Epson MX Graftrax Plus emulation to the Models 3304 and 3404.

Now available, the printers cost $1,199 for the 3014, $1,499 for the 3024, $2,490 for the 3304 and $2,650 for the 3404.

Costs are $4,065 for the 3184,

S O F T W A R E   A G

The innovator sets the standard with perfect vision.

In the 1970's we developed a system to provide data independence—before there was such a thing as a relational data base.

Next, we introduced a high productivity programming language for developing applications in an on-line data base environment—before there was such a thing as a fourth generation programming language.

In both cases we anticipated a trend, and delivered a product to meet a need before it was even defined by the industry.

We didn't just stop there.

We recognized the importance of maximizing worker productivity at a time when others were concerned about the high cost of machines. That's why we are the first to present an integrated series of products that use the same language.

We identified the need for a high volume product for VAX machines—while most still considered the DEC-VAX equipment only for low volume, low capacity applications.

We saw the necessity of having many machines working in coordination and developed our family of networking products to support this trend.

We realized the requirement for true distribution of data, so we carefully integrated data communication capabilities with our data base software.

By listening to our users, we anticipated the growing importance of 24-hour-a-day access to data. As a result, we now offer the first nonstop data base.

Today, while others are busy putting labels on our innovations, we are quietly moving on to our next innovation. And, that's the proper plan for the world leader in advanced systems software.

How can you be sure that your company will be ready for the challenges of tomorrow? Call us today.

$4,965 for the 3304 and $5,165 for the 3404, all scheduled for January delivery.

For the 4400 series of shuttle matrix line printers, the company announced optional character sets, including near-letter-quality Courier and italic fonts. The printers already had data processing and Gothic NLQ character sets and graphics, Greek and math symbols.

The Model 4410 prints 300 line/min and costs $5,300. The Model 4440 prints 600 line/min and costs $7,200. The optional character sets cost $45 to $90, depending on the set size.

Genicomm, One General Electric Drive, Waynesboro, Va., 22980.

PRIMAGES, INC.
Primage 90 print systems

Primages, Inc. has announced three 90 char./sec daisywheel printers, each with a Primage 90 printer and Pagemate sheet feeder.

The Primage 90 prints at 10-, 12-, and 15-pitch bidirectionally and features horizontal spacing in increments of 1/120 in. The unit also offers vertical spacing of 1/96 in., the company said. The daisywheel is said to have a 300,000-char. life with 100 petals that print in 10 European languages without changing a wheel. The printer's print-in-flight feature is said to increase speed, cut noise and reduce wear.

The Pagemate sheet feeders, available in two- or three-bin models, are said to hold 150 to 200 sheets of 8.5- by 11-in. paper, and the envelope bin holds 30 envelopes. The two- and three-bin sheet feeders can be fitted to the Primage I printer and the two-bin is convertible to a three-bin feeder for a charge of $250, the vendor said.

The printers are said to be compatible with equipment from Wang Laboratories, Inc., IBM and IBM compatibles, Burroughs Corp. and Digital Equipment Corp. via RS-232 and Centronics Data Computer Corp.-type interfaces, the company said.

The price for Primage 90 with a Pagemate I single-sheet feeder is $1,895; the price for Primage 90 with a Pagemate II two-sheet feeder is $2,095, and the price for Primage 90 with a Pagemate III two-sheet plus envelope feeder is $2,295, the company said.

Primages, 620 Johnson Ave., Bohemia, N.Y. 11716.

ANADEX, INC.
DP9632B

Anadex, Inc. has announced the DP9632B dot matrix printer for use with IBM 3270 terminals. The unit is said to operate at up to 240 char./sec.

Standard features of the DP9632B include tractor feed, double-width characters, horizontal and vertical tabbing, superscripts and subscripts, justification and a 3.5K-byte buffer, the company said.

Dot-addressable graphics are said to provide either 72 dot/in. or 144 dot/in., horizontal and vertical. Options include alternate character sets and 2K bytes of additional buffering.

The price for the DP9632B is $3,395, and delivery is scheduled for the first quarter of 1985, the company said.

Anadex, 1001 Flynn Road, Camarillo, Calif. 93010.

GRAPHICS SYSTEMS

AVL
Starburst; AVL Genesis

AVL has introduced a graphics presentation system that offers a color palette, three-dimensional business chart software, text formatting with the AVL Artgraphics free-form art capabilities and National Television Standard Code video output for videotape synchronization.

The Starburst computer graphics presentation system includes a 512K-byte CPU with a 10M-byte Winchester hard disk drive and a 5¼-in. floppy disk drive, a puck and digitizing tablet, a keyboard and a 12-in. monochrome programming monitor.

Users may select either a 12-in. or 19-in. color display monitor and either of two 4,000-line film recorder options, according to the vendor.

System prices — including the film recorder and all system software — begin at $14,995.

AVL has also announced the AVL Genesis multiimage programming computer that runs under Microsoft Corp.'s

"I RELY ON AST FOR

MS-DOS operating system and incorporates the Society of Motion Picture and Television Engineers (SMPTE) code.

The SMPTE time code is reportedly used to mark and drive videotape decks, audio decks and other electronic devices designed to interface with video devices.

The AVL Genesis CPU uses Intel Corp.'s 8088 and Zilog, Inc.'s Z80B dual processors at 4.77 MHz and 6 MHz, respectively, for instruction processing. It contains 256K bytes of random-access memory with two 5¼-in. double-density disk drives.

Outputs include two RS-232 serial ports for printer and modem connections and a Centronics Data Computer Corp.-compatible parallel printer port, the vendor said.

Price of the AVL Genesis is $5,495, according to the vendor.

AVL, 56 Park Road, Tinton Falls, N.J. 07724.

POWER SUPPLIES

AMERICAN POWER CONVERSION CORP.

300 PC+, 750XT+

American Power Conversion Corp. has announced the 300 PC+ uninterruptible power supply (UPS) for the IBM Personal Computer or microcomputers equipped with hard disks and the 750XT+ UPS for larger business configurations such as multiple IBM Personal Computer XTs.

The 300PC+ has four ac power receptacles and is engineered to power computer loads with a regulated output that provides both the correct peak ac voltage and the proper RMS voltage. For an extended utility outage, a typical IBM Personal Computer can operate for up to 15 minutes.

The price of the 300PC+ is $595, the vendor spokesman said.

The 750XT+ is said to protect against brownouts or momentary dips in the commercial ac supply. It can power up to four fully configured Personal Computer XTs for periods ranging from seven minutes to one hour, depending upon the load. The UPS provides low-distortion sinewave power.

The 750XT+ protects against surges, spikes and electromagnetic interference originating in the utility system. Included is an internal self-test feature and a current-limited battery charger with a preset float voltage.

The price of the 750XT+ is $1,995, according to the vendor.

American Power Conversion, 89 Cambridge St., Burlington, Mass. 01803.

GENERAL POWER SYSTEMS

Memorygard II

General Power Systems (GPS) has released a standby uninterruptible power supply series, Memorygard II, said to have a transition time of 2 msec.

The Memorygard II series comprises 24 models ranging from a 100W unit with a 9-min internal battery time to a 1 kVA unit with a 15-min internal battery time. All models employ pulse width modulation to achieve regulation of power.

Prices range from $495 for the 100W system to $1,295 for the 1 kVA system, the vendor said.

General Power Systems, 1400 N. Baxter St., Anaheim, Calif. 92806.

NOVA ELECTRIC MANUFACTURING CO.

Supernova 400

Nova Electric Manufacturing Co. has announced Supernova 400, an off-line uninterruptible power supply.

Supernova 400 reportedly isolates users from spikes and noise found on an ac power line. In the event of a brownout or power failure, a relay system transfers the load to a battery inverter system and maintains power, according to the vendor. When power returns, the load is automatically transferred back to the ac line and batteries are recharged, the vendor said.

The product can be used with word processors, micro-

MICRO-TO-MAINFRAME COMMUNICATIONS SOLUTIONS."

Working IBM® PCs into the world of large computers used to be quite a headache. But now that I've discovered AST and their full line of proven communication products, things are much easier.

Last week, for instance, the VP of Finance said he wanted to tie into the mainframe down the hall from his office. AST-PCOX™ was my instant answer. We just plugged the card into his PC, then ran a coax cable to the IBM controller. No need to double up on hardware or clutter up his desk with a dumb terminal.

Today, I'm solving a complex problem for our Director of Marketing. He's opening up seventeen new field sales offices and wants to link them to our host at headquarters. Now, at the same time, we're looking to convert our communication network from BSC to SNA. Here, AST really protects my hardware investment.

You see, they have SNA and BSC products with the same hardware. I can go with AST-BSC™ today, then just load another disk to upgrade to AST-SNA.™ And with AST's plug-in cards, PCs can emulate 3274/6 controllers, 3278-2 or 3279-2A terminals, even 3287 printers.

Using PCs in the field sales offices gives us the flexibility of local PC processing power, and the benefit of concurrent processing, since we can use DOS functions while continuing to maintain the mainframe link. It's certainly a major money-saver—a really smart alternative to dumb terminals.

We expect those new sales offices to grow rapidly. When they do, I'll be adding AST cluster functions so we can use PCs, and VT-100™ or compatible terminals in our configuration. All of them can communicate to headquarters over a shared phone line to reduce our telecommunications costs.

Meeting the challenge of change is a key part of my job. AST always has the products to help me. Like LANs to tie all PCs—including ATs and PCjrs together. There's also an AST-5251™ to connect PCs to System/34, System/36 and System/38 for powerful interactive communications from remote sites.

AST was the first company to offer micro-to-mainframe products for the PC, and they continue to lead the pack with a full spectrum of communications products, including AST-3780™ RJE support. Customer support and product reliability. That's why AST is my single source.

Frankly, you should find out more about them. Give their Customer Information Center a call at (714) 863-1333 Ext. 5249 and get acquainted. Just tell them you were referred by another satisfied MIS director.

IBM PC trademark of International Business Machines Corporation. DEC and VT-100 trademarks of Digital Equipment Corporation. TOPAZ ELECTRONICS
Ultra-Isolator

Topaz Electronics has announced the Ultra-Isolator line of noise suppressors intended to protect CPUs against power line noise. The units can also distribute power to peripherals.

Up to 21 power receptacles are available. Shielding is said to provide up to 146 db of common-mode noise attenuation, and low-pass filters combine with peak-limiting circuits to provide up to 60 db of transverse-mode noise attenuation.

Topaz Ultra-Isolator noise suppressors with power distribution are available in 50-Hz and 60-Hz models, with single-phase power ratings from 10 kVA to 20 kVA. Prices for the Ultra-Isolators start at $2,100, the company said.

INNOVATIVE ELECTRONICS, INC.
AC-10 Uninterruptible Power Supply

Innovative Electronics, Inc. has introduced the AC-10 Uninterruptible Power Supply unit designed to maintain power on a microcomputer system when AC line voltage fails.

The AC-10 enables an AC line connected to the microcomputer to be connected directly to the AC-10. When line voltage drops or fails completely, the battery inverter supplies 200W square AC with nominal recovery management system and peak voltages within 1.5 msecs for at least 15 minutes at full load, the vendor said.

The AC-10 is said to be ideal for situations in which protecting personal computer memory from power failure is vital. In addition, the AC-10 reportedly saves electronic typewriter memories when unplugged, according to the vendor.

The unit can also be used to operate security systems, run retail point-of-sale terminals during a blackout and ensure integrity of factory data collection systems.

The price of the AC-10 is $995.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

Macrolink gives memory boost to superminis

ANAHEIM, Calif — Macrolink, Inc. has announced an 8M-byte memory module for Perkin-Elmer Corp. 32-bit superminicomputers.

According to Macrolink, the module allows users of the PE 3210 to upgrade beyond the 4M-byte limit set by the factory. It uses 256K-bit dynamic random-access memory chips.

The 8M-byte module is priced at $25,000.

Macrolink is located at 1150 E. Stanford Court, Anaheim, Calif. 92805.

CAMBEX

from page 73

The technology for the Stor/8000 is the 64K-bit or 256K-bit MOS random-access memory and IBM-compatible emitter-coupled logic chip, the company said.

According to Cambex, the product is available now. The 8M-byte version is priced at $95,000. The 16M-byte version is priced at $180,000.

Cambex is located at 360 Second Ave., Waltham, Mass. 02154.

FERTIG

from page 73

IBM's VM/CMS environment, questions about IBM's direction in distributed DP and dismay over IBM's rapidly skyrocketing support costs.

Based on the survey, Fertig posited several IBM product/strategy scenarios through 1987:

- Unlike Digital Equipment Corp., IBM will purposely avoid providing a total integrated office automation solution for corporate users. DEC's OA solution lets users move from an entry-level Microvax-1 to a high-end configuration of clustered DEC 8600s without changing operating systems. Given this strategy, Fertig said DEC's products are an obvious target for plug-compatible manufacturers.
- IBM's popular Professional Office Systems Software will merge with what Fertig claims is its poorly performing Distributed Office Support System host-based business system by the second quarter.
- IBM will develop multiple solutions and overlapping products to answer mainframe server needs. The 8100 will be enhanced to act as a file and print server in a local-area network, and the 8100, 4300, System/36 and System/38 will serve distributed processing needs.
- IBM will announce initial models of its next mainframe family, the Sierra series, with capacities of 7.5 million to 30 million instructions per second, perhaps as early as the third quarter of 1985. Prices will begin at $150,000. Offering bulk main storage, the Sierra will adversely impact IBM's existing QX and KX models in the System 3081 line of processors by offering twice as much performance at a comparable price.
- IBM's mid-range System/38 will merge with the 4300 line by 1986 and serve as a key departmental and host system in IBM's OA strategy. In its present state, the product has been adversely impacted by the IBM 4300 and 3080 series products, Fertig said.

You live so

A 3M diskette can make one read/write pass on every track, every hour, every day for 200 years and still be in terrific shape.

Has 3M discovered the floppy fountain of youth?

In a way, yes.

We discovered that if you want to make a floppy that's certified 100% error-free and guaranteed for life, you have to make every last bit of it yourself.

That's why we're the only company that controls every aspect of the manufacturing process.

We make our own magnetic oxides. And the binders that attach them to the dimensionally stable substrate. Which we make ourselves from liquid polyester. Which we make ourselves.

We also test our

should long.

floppies. At least 327 ways. And not just on exotic lab equipment with perfectly aligned, spotless heads. But also on office equipment like yours. We even reject a diskette if its label is crooked.

Some companies claim their floppies are as good as ours.

They should live so long.

One less thing to worry about.

BOARD-LEVEL DEVICES

CSP, INC.
IOM-1

CSP, Inc. has introduced a peripheral device I/O module for its Mini-Map array processors. The IOM-1 is said to provide the means to transfer data to and from the Mini-Map without passing through the host computer.

The IOM-1 provides data transfer rates to 16M byte/sec while linking peripherals directly to the Mini-Map. It has a 32-bit bidirectional data port, a 24-bit address input and access to the memory control signals.

The IOM-1 is offered as a Mini-Map system option. When purchased separately, it is priced at $2,000, the vendor said.

CSP, 40 Linnell Circle, Billerica, Mass. 01821.

DATARAM CORP.
DR-280 series

Dataram Corp. has released a compatible memory board for Data General Corp. Eclipse MV/4000 and MV/10000 computers that provides up to 2M bytes of data storage.

The DR-280 series are single printed circuit boards providing up to 2M bytes of memory using 64K-bit random-access memory chips. Depopulated versions are available in 1M- and 512K-byte increments.

The DR-280 compatible memory with a 2M-byte capacity costs $6,900 when purchased singly.

Dataram, Princeton Road, Cranbury, N.J. 08512.

ACTION INSTRUMENTS, INC.
Analog, digital I/O cards

Action Instruments, Inc. has announced a line of plug-in, IBM-compatible analog and digital I/O cards for industrial processing and laboratory applications.

The Model AICP-AI04 is said to accept up to four analog inputs, transmit two analog outputs and provide 12 channels of configurable digital I/O, all with 12-bit resolution.

The Model AICP-AI016 can accept up to 16 single-ended or eight fully differential inputs with 12-bit resolution. The Model AICP-AI08 reportedly accepts eight single-ended inputs and provides seven I/O channels.

The AICP-RTD15 and AICP-TC15 cards are said to accept up to 15 channels and to provide 500V input-to-expansion bus signal isolation, the vendor said. The Model AICP-SG4 is a low-level analog card that accepts four fully differential inputs, provides eight outputs and sources its own excitation voltages for direct connection to load cells, strain-gauges and pressure transducers, the vendor said. The AICP-DIM32 and AICP-DOM32 each have 32 output channels and are used for interfacing multiple digital signals to IBM Personal Computers. Prices range from $250 for the AICP-DIM32 to $1,295 for the thermocouple, real-time device and strain-gauge cards.

Action Instruments, 8601 Aero Drive, San Diego, Calif. 92123.

VDT

from page 73

ous tasks on their own, and they became more useful.

Two other factors were important to the VDT's development — multiuser processing (time-sharing) and distributed processing. As many users accessed the same computer at the same time to do different things, terminals were differentiated according to their use; that is, they were specialized. The result of this specialization is that terminals used primarily in the office now look and work quite differently from those used to design submarine hulls or to direct robots on a factory floor.

Definitions have changed, too. The more intelligent and differentiated terminals become, the more closely they approach the status of an independent workstation. The line of demarcation between the two is now blurred.

The differences between a workstation and personal computer have also become blurred. A few years ago, the distinction was clear: The personal computer was self-contained, and the workstation was part of a larger system.

Today, of course, some personal computers can be used in networking environments, and some workstations stand alone.

All three devices — terminal, workstation and personal computer — will continue to coexist for some time to come. The distinctions between them will become even less clear.

In addition to the changes in terminal technology, there have been three major changes in terminal economics:

- Although terminal prices are falling, features that were once optional are now standard. Bold characters, underscoring and certain logical attributes are examples.
- The revenue ratio between the host computer system and its terminal is changing. This is a result of the terminal's increased functionality. Where once the host/terminal cost ratio was 90:10, today it may approach 50:50. In some of the most sophisticated CAD systems, the terminal may even cost more than the host.
- Because both computer and terminal costs have fallen more than the cost of communications, there is continuing pressure on computer systems manufacturers to minimize the need for communications by providing as much local processing capability as possible.

These economic factors are not likely to change significantly any time soon, but nearly everything else about the terminal will. These changes will affect the entire computer marketplace.

Until quite recently, the usefulness of computer systems was limited by what terminals could do. Now, smarter, faster and ever more functional terminals have begun to put pressure on their host systems to process faster and more efficiently. Terminal attributes such as color and graphics require more of the processor. This trend is expected to continue.

NORM DE NARDI PRESENTS
An Industry Salute To High Technology.
THE CALIFORNIA COMPUTER SHOW
At The Palo Alto Hyatt Hotel

The Longest Running Regional Computer Show

A unique, one day computer showcase highlighting industry trends and product introductions.

An opportunity to reach a base of qualified customers while simultaneously keeping abreast of the competition.

An ideal environment for OEMs, dealers and distributors to meet with industry leaders.

See the latest in computers, CAD workstations, graphic systems, peripherals, communication equipment, UNIX and other software development tools.

Norm De Nardi's computer industry expertise has made the California Computer Show a most effective marketing tool.

An extensive promotional effort including trade journal ads, direct mailings and show publicity insures industry awareness and participation.

Advertise in the largest computer market in Europe — Germany — and reach well over 155,000 people.

The German computer market is the largest in Europe and the third largest in the world. It has over $11 billion in installed general-purpose computers. The fastest growing segment of the German computer market is the microcomputer, with an installed value of $283 million. There were 10,000 IBM PC's sold in 1983 and another 30,000 units including IBM PCjr's are expected to be installed by the end of 1984.

You can reach the DP/MIS market, the PC market, the microcomputer market or the computer retailing market with our four German publications; *Computerwoche, PC Welt, Microcomputerwelt* and *Computer Business.*

Computerwoche is Computerworld's sister publication for the German EDP/MIS market. With a circulation of 30,000, *Computerwoche* reaches the important decision makers in medium to large computer-using organizations throughout the country.

We cover the microcomputer market with our microcomputer publication — *MicroComputerwelt.* Every month, *MicroComputerwelt* circulates to 65,000 German microcomputer professionals in the business, science and education fields.

PC Welt is our monthly publication specifically designed for IBM PC users. *PC Welt*'s total distribution is 50,000 and it is being sold at newsstands throughout Germany.

Computer Business, modeled after MICRO MARKETWORLD in the United States, covers all channels of distribution in the computer industry. *Computer Business*, circulates to 10,000 key decision makers with bulk-buying responsibility.

CW International Marketing Services makes it easy for you to advertise in countries all-around the computer world. For more information on any or all of our four German publications just fill out and return the coupon below.

Inventive software to spur net growth

Personal computer network vendors expect 'tremendous growth' next year

By Eric Bender
CW Staff

LAS VEGAS — While most personal computer local-area network buys have been aimed at reducing costs by sharing resources, future network sales will be driven by new software packages that represent "the [Software Arts, Inc.] Visicalcs of distributed data processing," according to Ken Biba, vice-president for personal communications at Sytek, Inc. of Mountain View, Calif.

During a session here last month at Comdex/Fall '84, other suppliers of personal computer local-area networks also emphasized that innovative application software will be critical for network growth.

L. William Krause, president of 3Com Corp. in Mountain View, forecast that a move from computer resource sharing to companywide information access setups will create enormous markets for new network software. Many employees now run applications such as spreadsheets and graphics on stand-alone micros, but networks represent a promising way to handle filing, mail, scheduling and the other tasks facing every employee in a company, he pointed out.

"We're in the same stage as personal computers were before Visicalc — balancing checkbooks," agreed Harry Saal, founder and chief scientist of Nestar Systems, Inc. in Palo Alto, Calif. "There are few, if any, applications that compel [that networks] be installed."

Additionally, many popular applications do not run on a network because they are copy-protected, Saal said, but he added that this approach is under fire from local-area network buyers. One Nestar customer, a General Services Administration regional office in San Francisco, "will not purchase copy-protected software because it won't run on the network," he said.

The announcements of the IBM PC Network and Microsoft Corp.'s Microsoft Networks and MS-DOS 3.1 established stable environment for application software, strongly encouraging the development of network applications and standard licensing policies, vendors said.

But while almost all suppliers intend to be compatible with the Microsoft network software, they still will differentiate themselves with both hardware and software offerings. "By no means does [Microsoft Networks] define the range of

ITT enhances Xtra micro

Micro-mainframe link, voice features added

PHOENIX — ITT Information Systems has announced options for the ITT Xtra Personal Computer that provide voice communications features, microcomputer-to-mainframe connections, graphics capabilities and 30M bytes of hard-disk storage.

Voice Communications options reportedly provide voice and speech recognition, voice store-and-forward capability, voice synthesis, telephone and management capabilities. In addition to voice control capabilities, digitized voice messages from a telephone or microphone can be stored on disk, the vendor said.

The voice products are designed for industrial inspection, medical facilities, education and telephone management applications. A voice subsystem is capable of recognizing 200 words from one speaker or between 25 to 100 words from a number of speakers, ITT said.

Micropro sees Wordstar 2000 turning the tide

By Eric Bender
CW Staff

LAS VEGAS — "We've been through a really difficult year," acknowledged Micropro International Corp. President H. Glen Haney.

As demand softened for Micropro's popular Wordstar microcomputer word processing software, the company's revenue and profits started to slide. A series of layoffs began last spring, and Micropro reported a loss of $756,000 for the quarter ended Aug. 31.

But Micropro's October introduction of the Wordstar 2000 series will turn the tide, Haney insisted at an interview here last month at Comdex/Fall '84. "We are reasserting our claim to be the undisputed leader in word processing," he said.

Early in the product development stage, the San Rafael, Calif.-based Micropro held an internal debate on whether to design

DBMS, utilities out for CP/M

CROTON-ON-HUDSON, N.Y. — Lawrence Information Systems, Inc. has introduced the Workbase data base management system (DBMS) and Data Baskets software that puts popular data bases on microcomputer diskettes.

Workbase, for the IBM Personal Computer or personal computers running under Digital Research, Inc.'s CP/M, reportedly uses a time-series data base structure and integrates data with tables, text, statistical analysis and graphics.

Workbase is priced at $889, plus $380 for color graphics capability.

Lawrence Information Systems also introduced its Data Baskets software, aimed at reducing the cost of accessing large data bases with a microcomputer.

Data Baskets, on diskettes, is priced from $150 annually, for foreign exchange and interest rates, to $850 annually, for industrial employment hours and earnings. Updated on a monthly basis, the two are $610 and $3,030, respectively.

Lawrence Informations Systems is located at 410 Albany Post Road, Croton-On-Hudson, N.Y. 10520.

[illegible]

[illegible] is manager of computer services at North Texas State University, Denton, Texas.

Quadram offers IBM micro add-ons, software

LAS VEGAS — Along with a raft of software from third-party developers, Quadram Corp. introduced several IBM Personal Computer memory boards and I/O boards at Comdex/Fall '84 here last month.

Quadram's Quad 2 Meg Card reportedly increases the internal memory of the IBM Personal Computer or Personal Computer XT to 2M bytes. The expanded memory is said to be especially useful for computer-aided design applications.

The $3,496 Quad 2 Meg Card board reportedly is twice as fast as a hard disk drive and useful for the creation of electronic read-only memory drives, print spoolers or disk caches. Software for those functions is bundled with the board. In addition, the Quad 2 Meg Card is said to feature a Basic I/O Subsystem chip that handles virtual memory functions without software drivers.

Quadram also introduced a similar board for the Personal Computer AT that provides up to 4M bytes of internal storage. The Quadmeg-AT board reportedly offers a 2M-byte increase in the 256K-byte storage of the AT and acts as a motherboard for up to two optional 1M-byte daughtercards.

Quadmeg-AT is priced at $3,995, with each additional daughtercard costing $1,995.

The Quadport-AT, a board that reportedly offers five additional serial ports and one parallel port for the AT, was also introduced.

The Quadport-AT is priced at $145 with one serial and one parallel port and $340 for the four-serial-port expansion kit.

The IBM PCjr also received a series of enhancement boards. Quadjr is an expansion chassis, priced at $695, that snaps onto the top of the machine and reportedly offers an additional 360K-byte drive, a parallel port and a clock calendar.

The $275 128K-byte Quadjr Memory Board for the Quadjr expansion chassis reportedly offers expansion to 384K bytes as well as Quadmaster II software for use in setting up a random-access memory drive, print spooler and disk cache. The Quadmemjr, also priced at $275, snaps onto the side of the microcomputer and reportedly offers 128K bytes of additional memory and Quadmaster II software.

Software offerings

Among the software offerings were Alpha Software Corp.'s $99 Executive Organizer, which includes functions such as an electronic date book and calendar, and $149 Deadline Manager; Select Information Systems, Inc.'s $149 4-1-1 retrieval system for file access in hard-disk storage systems and $50 Guide to Writing a Business Plan; and XQ Software, Inc.'s $295 Tax Strategist and $295 Investment Strategist.

Also introduced were three Select Information Systems word processors: Freestyle, based on the use of outlines, for $295; the Select Write, for $99; and the Bilingual, said to be driven by Spanish or English commands, for $395.

Quadram is located at 4355 International Blvd., Norcross, Ga. 30093.

Fortune 1000 supports Unix, PC-DOS

REDWOOD CITY, Calif. — A group of workstations reportedly able to run both an AT&T Unix-based operating system and IBM's PC-DOS has been introduced by Fortune Systems Corp.

The Fortune 1000 desktop workstation family reportedly consists of a group of 17 options, from which a workstation can be configured based on users' needs.

The workstations reportedly operate in conjunction with Fortune's existing 32:16 CPU and also permit networking between IBM Personal Computers and various Fortune products.

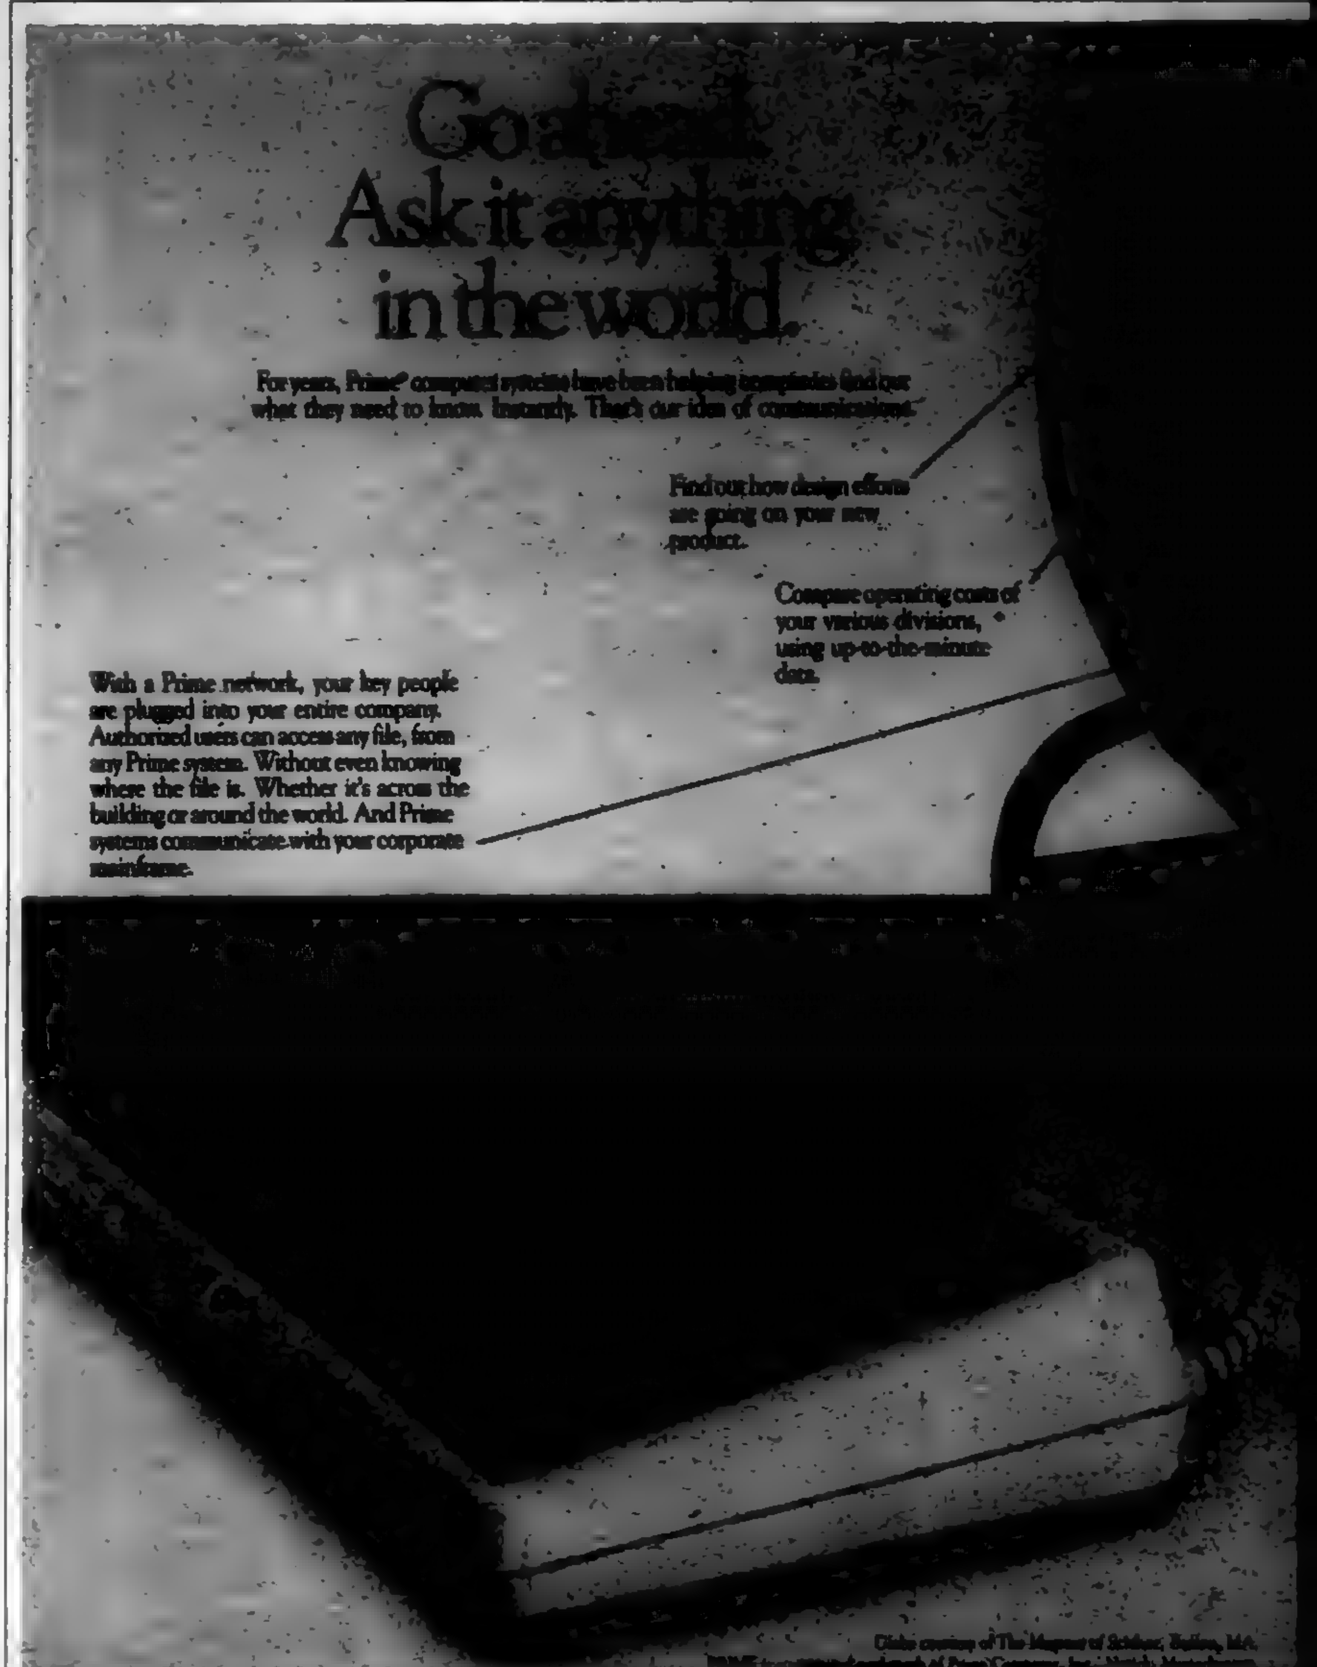
Available options

Among the available options are a color monitor, an upgradable Ascii terminal with a 14-in. monochrome monitor, hard or floppy disks and networking or stand-alone capabilities.

Also available is a high-speed data link that provides intelligent workstation capabilities under PC-DOS, Fortune's Unix-based For:Pro operating system or a configuration combining those operating systems, according to the company.

Workstations in the Fortune 1000 family begin at $795 for an Ascii terminal and extend to about $9,500 for a workstation that includes Unix and PC-DOS capability along with a color monitor, color graphics board, local-area network card and a 10M-byte hard-disk storage unit.

Fortune Systems is located at 101 Twin Dolphin Drive, Redwood City, Calif. 94065.



For years, Prime® computer systems have been helping companies find out what they need to know. Instantly. That's our idea of communications.

Find out how design efforts are going on your new product.

Compare operating costs of your various divisions, using up-to-the-minute data.

Plasma Display offered for IBM Personal Computer

MONTVALE, N.J. — IBM has announced that its Plasma Display, introduced in 1983 as a mainframe terminal, is now available as an OEM product for the IBM Personal Computer and Personal Computer XT.

The IBM 3295 Plasma monitor works with the IBM 3296 Display Adapter and provides 64 160-char. lines.

The plasma monitor reportedly features an undistorted, flicker-free image with a resolution of 960 by 768 lines or 737,280 pixels. The monitor displays alphanumeric, noncoded and graphics information.

The adapter features a 32K-byte display buffer and can store up to eight 25-line, 80-char./line screens, IBM said. It supports six types of programming requests: control processing of lists of orders, control of how the screen displays data, control of when and how emulation operates, light of any picture element on the screen, creation of vectors and display of all-points-addressable alphanumerics.

The monitor costs $2,475, and the display adapter sells for $935.

IBM is located in Rye Brook, N.Y. 10573.

Venix/86, tools available on Personal Computer AT

CAMBRIDGE, Mass. — Unisource Software Corp. has announced that Venix/86 (an implementation of AT&T's Unix System V) and three Venix/86 packages (the Connector, Unify and Fortran 77) now run on the IBM Personal Computer AT.

Venix/86's kernel and driver fit in 50K bytes of random-access memory, Unisource said. Venix reportedly features University of California at Berkeley extensions, real-time capability, record-locking and graphics capabilities.

The Berkeley extensions include VI, Termcap and C Shell and permit flexible data handling, according to the vendor. Real-time capabilities include raw I/O, shared data segments, page addressing and asynchronous I/O. Record locking allows more than one user to access a program while maintaining file integrity, the vendor said. The graphics capabilities support medium- and high-resolution plotting and graphing.

The Connector reportedly enables a user to run programs for IBM's PC-DOS and Venix operating systems concurrently. The product allows a user to run the vast library of PC-DOS programs and to take advantage of Venix/86's multiuser, multitasking capabilities, Unisource said.

Unify features include menu-driven design, a screen-handling package, raw I/O and built-in optimizers, according to the vendor. The data base does not require that a user memorize complicated command sequences, eliminates the need for coding to format screens, allows a user to bypass the Venix/86 file system for faster performance and provides four data access methods, according to the vendor.

Fortran 77 has been widely used for applications that manipulate numerical data and provides easy porting programs from one machine to another, Unisource said.

A one- to two-user version of Venix/86 sells for $875, while an eight-user version costs $1,075. The Connector costs $299, Unify is priced at $1,495, and Fortran 77 sells for $395.

Unisoft is located at 71 Bent St., Cambridge, Mass. 02141.

Tecmar offers Maestro board for IBM micro

SOLON, Ohio — Tecmar, Inc. has introduced its Maestro multifunction board for the IBM Personal Computer AT.

The board reportedly offers memory expansion in two blocks: one upgrading the Personal Computer AT to a maximum of 640K bytes of internal memory, which is the maximum directly usable by its PC-DOS operating system; the other is said to be upgradable to 2M bytes, in increments of 64K or 256K bytes, a feature said to be useful for multiuser environments.

As a single board, Maestro reportedly avoids problems of heat buildup and connector unreliability found in the use of a daughterboard. Its parallel and serial ports can connect printers, plotters, modems and mice, and its programmable array logic chip can secure software, Tecmar said.

Maestro prices range from $529 for a unit with no internal memory to $3,989 for a board with 128K bytes of random-access memory and 2M bytes of additional storage starting at the 1M-byte address.

Tecmar is located at 6225 Cochran Road, Solon, Ohio 44139.

Dayflo software enhanced

Three options, Macrokey utility available

IRVINE, Calif. — Dayflo, Inc. has announced the enhancement of its Dayflo software to include Macrokey, a utility that allows the creation of push-button applications. Dayflo runs on the IBM Personal Computer, Personal Computer AT and Personal Computer XT.

Dayflo 1.1 also reportedly includes a guide that provides step-by-step instructions on creating customized data base solutions. Macrokey is said to allow users to program one or two keys to perform a set of functions or commands.

The package's report writer now offers a preprinted forms option and the ability to print a report to a DOS file in standard Ascii format, the company said. Dayflo also includes the Correspondent, which reportedly allows users to create, edit and print letters and memos, and the Personal Contact Manager package, which permits users to organize and access their daily business contacts, the supplier said.

Dayflo 1.1 is priced at $495. The Correspondent and the Business and Personal Contact Manager are currently provided free with Dayflo 1.1. Otherwise, they are $35 each.

Dayflo is located at No. 400, 2500 Michelson Drive, Irvine, Calif. 92715.

General Computer releases disk unit for Macintosh

CAMBRIDGE, Mass. — A hard disk storage unit said to combine 10M bytes of storage with optional memory expansion to 512K bytes for the Apple Computer, Inc. Macintosh has been introduced by General Computer Co.

The Hyperdrive reportedly speeds program loading and data transfer by Apple's Macintosh. The Hyperdrive's disk interface logic board is directly connected to the main circuit of the Macintosh, allowing all of the computer's serial ports to remain free for use by a modem, printer or the Apple Applebus, according to General Computer.

System software provided with Hyperdrive reportedly allows the storage unit to divide into many virtual disks that automatically resize themselves to accommodate files.

According to General Computer, Hyperdrives for the Macintosh are available in two models. The unit with memory expansion to 512K bytes is priced at $2,795. The unit without the random-access memory is priced at $2,195.

More information is available from General Computer at 215 First St., Cambridge, Mass. 02142.

Desq integrator enhanced by Quarterdeck

LAS VEGAS — Quarterdeck Office Systems has announced an enhanced version of the Desq multiwindowing software integrator that supports Microsoft Corp.'s MS-DOS 2.1 and 3.0.

Desq 1.2 supports the IBM Personal Computer AT, the Compaq Computer Corp. Deskpro series and many other recently introduced IBM-compatible systems, according to Quarterdeck President Therese Myers.

Myers claimed that the new version of Desq is the first windowing program to take advantage of MS-DOS 3.0 features. "The new program is able to use up to 3M bytes of extra memory in these systems as virtual disk, thus facilitating program swapping," she said.

The new release, scheduled for shipment by year-end, will be available free to registered users currently running Desq under earlier versions of MS-DOS or under IBM's PC-DOS. Desq is priced at $399.

Quarterdeck also announced that versions of Desq for the Digital Equipment Corp. Rainbow 100 and for the NCR Corp. PC4 will be offered through those system manufacturers. Desq for the Rainbow will be available in December, while a version for the PC4 will ship in January, the company said.

Quarterdeck is located at 1918 Main St., Santa Monica, Calif. 90405.

"Miss Brown, do you have a nanosecond?"

There's A New Direction In Laser Print Technology.

Introducing the QMS Lasergrafix™ 800.

Now you can bring laser print technology right to your desk for all your business and industrial graphics needs. The Lasergrafix™ 800 from Quality Micro Systems brings full bit-mapped graphics capabilities down to true desktop size. And if you thought the flexibility, convenience and economy of laser print technology was priced over your head—look down—to under $10,000.

For letter quality word processing. Bar charts. Pie charts. Even barcodes. Full bit-mapped page memory lets you mix text and graphics, different letter sizes and type styles—all on the same page—even on the same line. The Lasergrafix 800's intelligent controller takes simple print commands through your normal data stream. So your computer's memory resources are free to do other important work.

And, QMS intelligent applications firmware is standard throughout our entire growing family of electronic page printers. So your Lasergrafix 800 can be part of a print applications master plan—a plan which can include the pioneering Lasergrafix 1200 for more continuously print intensive locations.

You get whisper quiet performance. So you can place a print workstation with the efficient printing speed of eight pages per minute, almost anywhere you need one. And the Lasergrafix 800 interfaces with just about any computer system you can name. So you can be up and running in no time—in the hottest new direction in the graphics field—down. With the Lasergrafix 800 from Quality Micro Systems. Ask for a demonstration today.

___ Send me the Lasergrafix 800 Information Packet, samples of mixed fonts, graphics and everything else it does.

___ Please contact me to arrange a demonstration.

AARON/SMITH ASSOCIATES, INC.
Search Companion

Aaron/Smith Associates, Inc. has introduced Search Companion, a text editor for work with downloaded on-line searches on the IBM Personal Computer.

Search Companion reportedly allows users of on-line services and information utilities to select only those parts of the downloaded data that they want to keep and to print those parts in any order.

On-line searchers can use the product to take output from commercial data base systems, keep only those parts desired, remove all unnecessary computer codes, sort the remaining information in any order, reformat and print or store the results, according to the vendor.

Search Companion is priced at $295 and requires a minimum of 128K bytes of memory.

Aaron/Smith Associates, Suite 518, 1422 W. Peachtree St. N.W., Atlanta, Ga. 30309.

MITCHELL MANAGEMENT SYSTEMS, INC.
Quick-Plan

Mitchell Management Systems, Inc. has announced Quick-Plan, a project management package that runs on a number of microcomputers with Microsoft Corp.'s MS-DOS operating system.

The product constructs project plans and tracks time, cost and available resources, the vendor said. Quick-Plan reportedly handles 250 activities, 99 resources and 500 connectors for each project.

It is said to include editing and modeling capabilities and 13 types of report formats. Zoom, spread and isolating graphics are available on-screen or in reports, the vendor said.

The program runs on the IBM Personal Computer, Wang Laboratories, Inc. Professional Computer, Data General Corp.'s Desktop Generation, Digital Equipment Corp.'s Rainbow Plus and Hewlett-Packard Co.'s HP 150. The program requires 384K bytes of random-access memory.

Quick-Plan sells for $995.

Tools out for micros running Xenix

SANTA CRUZ, Calif. — The Santa Cruz Operation, Inc. (SCO) has introduced a line of business software for the IBM Personal Computer, the Apple Computer, Inc. Lisa and the AT&T 6309 running under Microsoft Corp.'s Xenix operating system.

The Xenix Now! line reportedly includes versions of Microsoft's Xenix for those machines and several Xenix-based applications programs, including SCO's Lyrix word processor; Relational Data Base Systems, Inc.'s Informix relational data base manager; Microsoft Corp.'s Multiplan; and Micro Focus, Ltd.'s Level II Cobol.

The Xenix operating system reportedly allows users to call up, with one keystroke, a screen display from any of up to 10 simultaneously running applications programs. Two optional Microsoft programs are available for it — the Xenix Text Processing Package and the Xenix Software Development Package.

Lyrix reportedly is menu-driven and has an on-line Help facility and mail-merge capability. Informix provides audit trails, compatibility with Level II Cobol Isam files and support for multiuser applications, according to the vendor. Multiplan for Xenix reportedly offers standard Multiplan capabilities such as cell capacity of 63 col. by 255 rows and built-in formulas to create models.

Compact Level II Cobol reportedly offers a runtime system written in C language and a data-entry program generator that generates Cobol programs for screen input and data file upkeep.

The Xenix operating system is priced at $595 for the IBM Personal Computer and AT&T 6300 and at $795 for the Apple Lisa. The other software is priced the same for the three machines as follows: Lyrix, $595; Multiplan, $495; Informix, $795; and Compact Level II Cobol, $795. The Xenix Development System and Xenix Text Processing System are priced at $595 and $495, respectively.

SCO is located at 500 Chestnut St., Santa Cruz, Calif. 95061.

How to get caught in the middle of today's biggest controversy.

FOCUS

on UNIX.

Love it or hate it, UNIX™ is one of the most controversial topics of the day. And that's just the way we'll be presenting it in January's premier issue of Computerworld Focus.

Everyone with any interest in UNIX will be sure to read the January 16th issue of Computerworld Focus, where we'll really dig deep into today's issues and answer some of the toughest questions. Which version is best for what operations? How do you implement applications software? Is UNIX truly portable? How to make UNIX user friendly. With pages chock full of user opinions. Expert views. Tutorials. Investigative reports and other information.

Whether you have a UNIX compatible service or product, or a UNIX alternative, there will never be a better place to make your case. You'll get over 126,000 Computerworld paid subscribers for starters. Plus our high pass-along readership. Plus bonus circulation at the UniForum show on January 21-25 in Dallas, Texas.

But hurry, January's Computerworld Focus closes December 7. So act now. To reserve your space or for more information, call Ed Marecki, National Sales Director, at (617) 879-0700. Or call your nearest sales office listed below.

UNIX is a trademark of AT&T Laboratories.

MICROCOMPUTERS

Continued from page 89

Autodesk's Autocad computer-aided design (CAD) system. It reportedly can run on any microcomputer able to run both Autocad and Microsoft Corp.'s MS-DOS operating system.

Said to be useful for architects, engineers and others in the construction industry, AE/Cadd reportedly enhances Autocad by providing a set of digitizer overlays and a symbol library. These overlays and the library reportedly allow creation of working drawings for the architect, along with specialized engineering drawings.

AE/Cadd Master, the first overlay/symbol library in what will reportedly be a more extensive drawing set, is priced at $1,000, the vendor said.

Autodesk, 2658 Bridgeway, Sausalito, Calif. 94965.

NETS

from page 85

networking solutions," Biba said.

Most network vendors forecast that sales will double or better in 1985. Joseph Hughes, marketing vice-president at Corvus Systems, Inc. of San Jose, Calif., estimated that overall industry shipments have reached the 200,000 node per year level and will triple in a year.

Hughes listed three main reasons for tremendous growth: heavy local-area network advertising by IBM and Apple Computer, Inc., the availability of net software from major software vendors and lowered hardware connection costs.

Noting that Corvus has signed an agreement with NEC Corp. to develop a single-chip version of the Corvus Omninet network controller, Hughes agreed with a prediction by Dallas-based Future Computing, Inc. that 30% of all computers will have local-area networking built in by 1987.

Also at the show, microcomputer networks got a strong vote of confidence from Zenith Data Systems Corp., the first major personal computer supplier to announce an off-the-shelf diskless model. The diskless Z-150 demonstrates "that networking is becoming more and more an integral part of our business," said marketing vice-president John Frank.

Comdex/Fall displayed early signs of a 1985 bonanza of networking software, with products introduced by Micro Data Base Systems, Inc., Software Products International and other vendors.

However, network licensing problems still cropped up. In one case, Lotus Development Corp. sent personnel around the show to check that its 1-2-3 package was not delivered across networks, exhibitors said.

CHARLES RIVER DATA SYSTEMS, INC.
Enhanced Unos

Charles River Data Systems, Inc. has enhanced Unos, an AT&T Unix-compatible operating system that runs on Charles River Data's Universe 68 and Universe 2203 lines of supermicrocomputers.

The enhancements reportedly include the ability to manipulate larger disks and data files. The operating system now supports files up to 2G bytes in size, compared with 67M bytes previously, the company said.

The operating system can connect to an IBM mainframe, and up to 32 Charles River terminals can emulate IBM 3270, 3770, 3780 and 2780 terminals, the vendor said.

Unos is said to support Charles River Data's Universenet, which complies with International Standards Or-

ganization standards. The net features electronic mail, file transfers, remote job execution and message passing.

Unos costs $4,000; current users can upgrade to the new operating system for $1,200.

Charles River Data Systems, 983 Concord St., Framingham, Mass. 01701.

COMPUTER-AIDED DESIGNWARE, INC.

PC-CICS

Computer-Aided Designware, Inc. has introduced its PC-CICS software, which reportedly permits the IBM Personal Computer to test command-level IBM CICS programs.

The development of CICS programs reportedly can be done without the use of the mainframe by using PC-CICS. The software allows finished programs to be uploaded to a mainframe, recompiled and executed without modifications, according to the vendor spokesman.

PC-CICS is said to use an IBM Vsam file structure with utilities to convert data files between the mainframe and the Personal Computer. Among other capabilities, the utilities are said to give the ability to convert PC-CICS data files to sequential data files.

PC-CICS is priced at $500, according to the vendor.

Computer-Aided Designware, P.O. Box 17188, Salem, Ore. 97305.

DAVELL CUSTOM SOFTWARE

DCS Multistat

Davell Custom Software has introduced its DCS Multistat for the IBM Personal Computer and Personal Computer XT.

DCS Multistat is said to be a statistical analysis program designed specifically for engineering and scientific applications.

The software reportedly is an integrated package that does not require programming and includes an editor, statistical routines, screen graphics and report writing capabilities.

No special loading or linking commands are needed to move among the sections of the program, a vendor spokesman said.

DCS Multistat is priced at $290, according to the company.

Davell Custom Software, P.O. Box 4162, Cleveland, Tenn. 37311.

ITT

from page [illegible]

The $1,295 ITT Voice Communication Subsystem consists of a voice option board, voice communications software, documentation and telephone cable. Other options include a microphone for $55, voice utility software for $25, telephone cables costing $2 and Executive Desk Set software priced at $65 that provides an appointment calendar, phone directory, speed dialing and automatic answering.

Two micro-to-mainframe packages were announced, one offering IBM 3278 and 3279 terminal emulation, and the other giving IBM 3270 Personal Computer features, the vendor said.

The $1,145 IBM 3278 and 3279 adapter reportedly provides four windowing sessions: one interactive host session, one personal computer mode and two notepads. Each window can occupy a full screen or various user-defined combinations. The user is able to alternate between host and personal computer applications, ITT said.

The $1,595 3270 Personal Computer-like adapter provides eight windows: five interactive host sessions, one personal computer mode and two electronic notepads. The product allows a printer on the system to act as an IBM 3287 printer, ITT said.

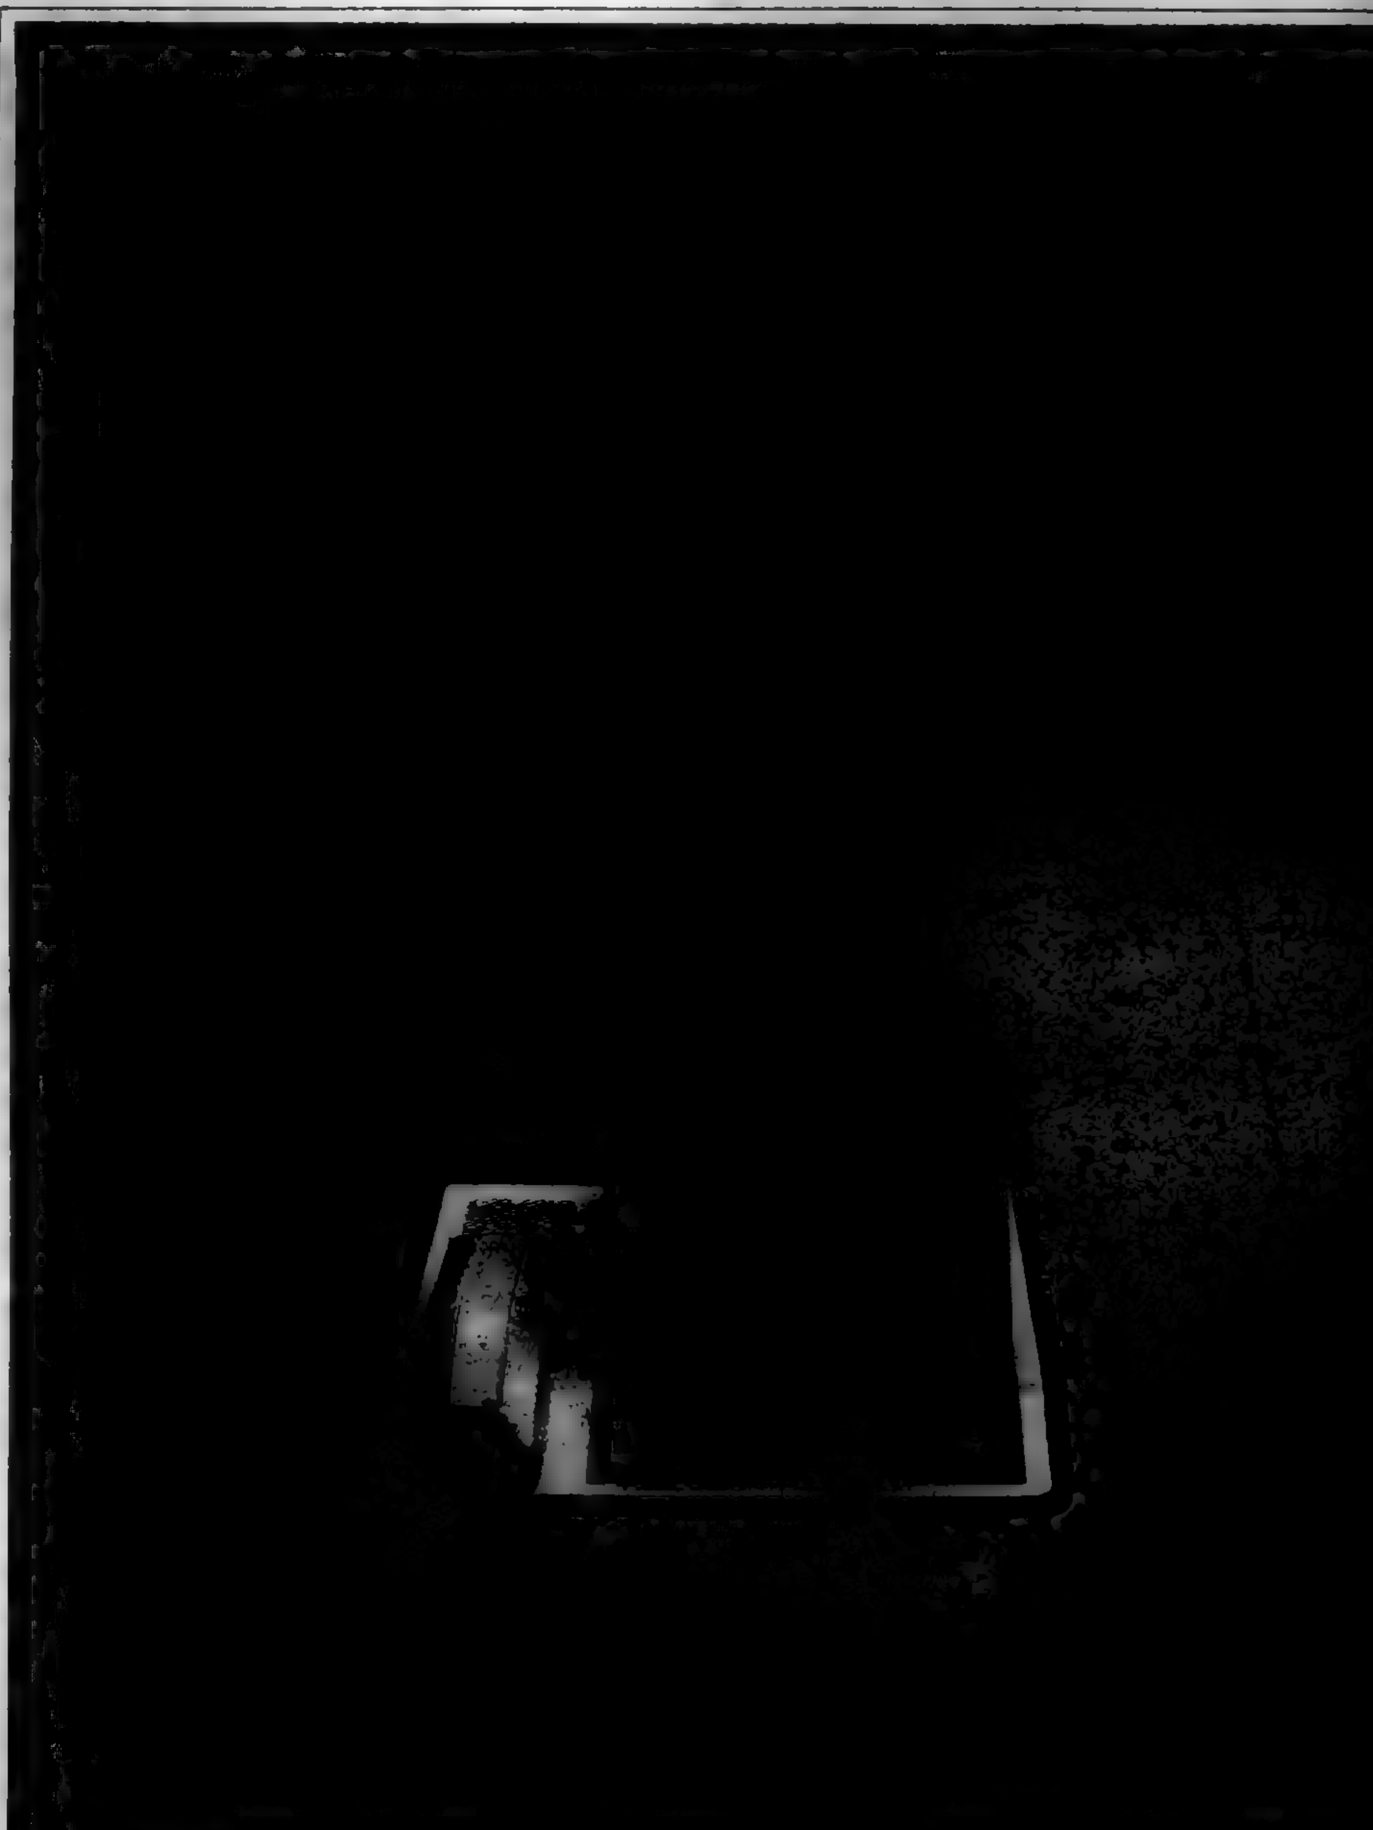
The heart of the graphics enhancements is a $650 Integrated Graphics Adapter that features a real-time clock, selection of font styles, single-slot system expansion and support for all ITT monitors, according to the vendor.

Other graphics options include 128K bytes of random-access memory (RAM) for $295 and 256K bytes of RAM for $400. The company also added two 14-in. monitors: a $695 color-graphics monitor and a $395 dual-mode monitor that allows a user to switch between monochrome or color displays.

Finally, customers can purchase a 30M-byte hard disk drive for $3,950.

The color graphics monitor is available now, while the other products will be shipped in March.

ITT Information Systems is located at P.O. Box 52016, Phoenix, Ariz. 85072.



HANEY

from page 85

the new software along the lines of the original Wordstar or to explore different options, Haney said.

"For Wordstar, there are over 1¼ million users who bought the product," he noted. "A lot of Wordstar users don't want to switch." The decision was to start from scratch with the new product, while maintaining and developing the Wordstar line, Haney said.

Starting from scratch left Micropro free to address the ease-of-learning and ease-of-use complaints of many Wordstar users, Haney said. Testing showed that Wordstar 2000's mnemonic commands were far superior to Wordstar's control-key functions, Haney said. Other upgrades include power features such as windows, list management, simple calculation functions, format sheets and an Undo command.

Micropro defines word processing broadly, from conceptualizing through writing and editing to specialized output, Haney said. Among future enhancements, "grammar correctors are clearly on the horizon," he said. Better communications, improved file management and links for automatic typesetting are also scheduled.

The first release of Wordstar 2000, set to ship by December, is for the IBM Personal Computer. Other versions for Microsoft Corp. MS-DOS-based computers are in the works, and Micropro is also studying releases for AT&T's Unix-based machines or Apple Computer, Inc.'s Macintosh.

Micropro endorses IBM's Topview operating environment, and versions of Wordstar 2000 supporting Topview are running in the lab, Haney said. "Topview really legitimizes the viability of stand-alone products that work together," Haney said. "The bloom is off the seamless integrated package idea, because you have to be so clever to use [one]."

Noting that Micropro has seen heaviest competition from low-priced products, the company will continue to be "a price stabilizer," Haney said. "Wordstar itself was a $495 package for five years, and now we've established a new umbrella. We will continue to stuff more functionality into the product; that's an insidious price erosion in itself," he added.

MICROS

from page 95

organization. Certainly the general introduction has meant that we now know things about our jobs that were not available in preautomated days, and much the same development can take place with the introduction of micros.

An organizational example is budget management within a cost center.

Centralized fiscal reporting in a large organization typically lags behind the need for information by budget authorities at a departmental level. But a spreadsheet or a data management system on a microcomputer frequently makes it possible to arrange a budget control procedure to alleviate the problem.

Budget control

Simple budget control processes that are difficult to implement centrally may be easy to do on micros. The result is that department heads can have the minute-by-minute updates they need to do an effective job of budget control.

Because one of the primary objectives for the deployment of micro-based workstations for professionals and managers is productivity improvement, it is incumbent on an organization to understand what "productivity improvement" means.

Vendors use productivity improvement measures to demonstrate that their equipment will be cost-effective, but those measures sometimes are very subjective. However, when micros are deployed along with support services such as training programs, productivity indeed can be improved.

"Say, that really is a micro-computer!"

Wang programming institute blends business, tech skills

By David [illegible]
CW Staff

TYNGSBORO, Mass. — "We would like to think we're the wave of the future," said Richard Fairley, a professor and department chairman at the Wang Institute of Graduate Studies here, as he described the mission of the school's graduate program for software engineers.

With its 55-student enrollment and one main building — a former seminary surrounded by 200 acres of woods, water and fields — the school has carved out a unique curriculum by combining the disciplines of computer science and business management.

Founded in 1979 by Dr. An Wang, founder and chairman of Lowell, Mass.-based Wang Laboratories, Inc., the institute is one of only three schools in the U.S. offering a master's degree in software engineering and is said to have the only full-time program of its kind. It has nine faculty members.

Wang Institute

The school's program is targeted at industrial software engineers seeking to gain a better grasp of both the technical and managerial skills of software development and maintenance, according to Fairley.

"We are different from computer science and we are different from business school-MIS programs," Fairley said. Most schools do not offer an interdisciplinary approach to the two subjects, he said. As a result, computer science graduates typically lack managerial skills and business school graduates lack technical skills.

"A lot of other schools are looking at our program and are interested in what we are doing," he asserted.

Another goal of the school is to help alleviate the nationwide shortage of software specialists with highly advanced, graduate-level skills. Fewer than 200 students graduate each year from U.S. colleges with Ph.D.'s in computer science, Fairley said, adding that the school is considering forming a Ph.D. program.

Although the school was founded and is primarily funded by An Wang, there is no affiliation between Wang Laboratories and the school. The school is not a training ground for future Wang employees, Fairley said.

The program, which typically takes a full-time student a year or more to complete, has a core of six required courses: systems architecture, formal methods, programming methodology, management concepts, software engineering and project management. The students also choose from three elective courses and are required to complete two team projects.

Students at the institute typically have four to five years of work experience in the software field and are in their late 20s or early 30s. Many, but not all, of the students are sponsored by corporations. "They are people who have made the basic decision that they need more education for career advancement" to supervisory positions such as project managers, Fairley said.

"Our people are already good programmers when they get here," Fairley said, adding that admission requirements are rigorous and include a 90-minute interview.

While the school is small and has yet

Healthy perks keep turnover low, firms find

Offers include furnished homes, baby bonuses

By Kathleen Burton
CW West Coast Bureau

In pre-high-technology eras, a marked parking space near a company's front door, an annual picnic, an insurance plan and a gold watch after 30 years of dedicated service were all an employer had to offer his workers to keep them happy.

Those days are gone forever, at least in the Silicon Valley, according to Craig Justice, a veteran valley headhunter with EDP World, a recruitment agency in San Jose, Calif. "Because there are so many start-ups in the Silicon Valley, there's more job-hopping here than anywhere else in the world," he said. "People only stay with a company two years here on the average."

Because of this employee fluidity, most Silicon Valley-based firms must take a creative approach to luring and retaining a top-notch staff, Justice said. Apple Computer, Inc. in Cupertino, Calif., for example, offers a $500 "baby bonus" for workers who give birth to or adopt a baby; Advanced Micro Devices, Inc. in Santa Clara, Calif., each year raffles away a furnished home to an employee; and Hewlett-Packard Co. sends

AEA offers ideas for renewing U.S. market strength

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

"'Reduced government spending is more compatible with the goal of increased international competitiveness than higher taxes," the American Electronics Association (AEA) declared in a position paper circulated just prior to the presidential election.

In the paper, titled "Strategies for Innovation, High Technology Industries and International Competitiveness," the AEA reiterated its concern about U.S. industry's "declining international competitiveness in an era of increasing global competition."

But while the AEA embraced the free market, decentralized planning philosophy that the so-called New Right advocates, it lined up closer to the posture of the neoliberals. These, formerly tagged as Atari Democrats, tie entrepreneurial enterprise with the need for limits on government spending on both social and military programs.

Competing successfully

"We cannot successfully compete with Japan and other emerging competitors while almost single-handedly providing a security blanket for the free world," according to the AEA.

National security should rank high, according to the AEA, but national security also requires a strong economy to pay for defense programs and to spur competitiveness in the international arena.

The deteriorating U.S. trade position is highlighted by a seemingly never-ending stream of quarterly reports detailing the declining balance of trade. The AEA sees the decline of the U.S. trade position as being caused by "a combination of complex, interrelated issues, including burgeoning federal budget deficits, excessive civilian and military government spending, an overvalued dollar, foreign targeting, access to foreign markets and export restrictions far greater than those of our competitors."

Rebuilding preeminence

The key to rebuilding America's preeminence on the foreign trade circuit, in the AEA view, is reversing the decline in relative productivity growth.

According to the paper, such a resurgence could be spurred by lowering the cost of capital, increasing the capacity and quality of engineering education and increasing R&D investments.

The AEA was particularly critical of the shift in federal R&D funding to military priorities: "We cannot allocate 70% of federally funded R&D to defense and severely limit U.S. high-technology exports, even in Western trade, without paying a very significant price in terms of competitive strength.

"We cannot siphon off a disproportionate share of our scarce technical resources to military applications and still stay ahead of Japan in commercial markets," the AEA paper stated.

It will be interesting to see if anybody in Washington, D.C., pays attention to a group representing some of the fastest growing industries in the U.S. and worldwide [illegible]

IBM compatibility refuted as key to market survival

By David C. Dykstra
Special to CW

First of two parts

There has been an overwhelming amount of discussion that IBM compatibility is necessary for survival, but the facts dispel the myth. The non-IBM world is alive and prospering.

My review of published earnings reports reveals there are now more than 400 publicly held companies in the computer industry. The total number has increased every year since the inception of the industry.

For 1983 vs. 1982 and for the first nine months of 1984 vs. 1983, sales and earnings increases vs. decreases were more than 2:1 for all computer companies, including non-IBM-compatible companies and non-IBM Personal Computer-compatible companies. Computer industry directories indicate an even greater growth for the privately held companies. Here are the facts.

IBM early leader

In the early 1970s, business computers costing less than $100,000 emerged that could operate without a full-time computer programmer on the payroll. IBM was the early leader in this market with its System/32, which included standardized, basic accounting software.

As this market matured, new vendors provided varied customer- and industry-specific software and multiuser capabilities.

The markets became more fragmented and vendor support became more important. IBM virtually abandoned this segment and concentrated on the larger dollar volume — and apparently more profitable — hardware-oriented (as opposed to software- and support-oriented) first market segment.

The pattern in the current under-$10,000 computer market has been repeated: The market emerges and grows; IBM enters the market when it considers market size sufficient; and the experts predict a shakeout. That is where the market is at currently.

Subsequently, the market breaks into new segments or niches, the total dollar volume continues to grow, the number of companies increases and IBM loses total market share.

Many U.S. computer companies whose annual sales range from $4 million (0.01% of IBM) to $400 million (1.0% of IBM) are profitably serving many market niches that are too small to be of interest to IBM. These companies obviously cannot afford an IBM-size marketing budget, and the individual markets do not have broad public interest. For both reasons, these companies do not receive much media attention. The marketing campaigns by these companies must be targeted.

Many of these companies are privately held; their owners seem to be content with their low-profile images and their annual personal incomes of $100,000 to $1 million. These types of companies are well represented in the non-IBM-compatible multiuser market.

Because personal computers have received the most media attention and have been the subject of the widest spread myths concerning IBM compatibility, we will direct our at-

Get better decision-making, more productivity and a very profitable competitive edge. Instantly.

What if everyone in your office were suddenly able to design their own applications, whether they knew anything about programming or not? What if this left you and your computer professionals free to concentrate on really important jobs?

Well, this is exactly what SMARTSTAR does. It puts the power of the VAX at the fingertips of those who need it, no matter how much or how little they know about programming. They get information fast. So they can make decisions fast. Productivity skyrockets. And so does profitability.

Programmers are relieved of the tedious jobs, the busywork — and most important, the backlog of programming jobs that will now be handled by end-users.

For complex applications, SMARTSTAR's structured interface and built-in callable routines reduce development time by a 10 to 1 ratio. Features like scrolled forms, multiple overlapping windows and simple keypad commands simplify the whole decision support process for everyone. SMARTSTAR even works with DEC's new VAX/Rdb to make accessing the database a snap.

Call Signal Technology, the leading independent developer of VAX software, for a 30-day trial or on-line demo. See how SMARTSTAR can make your whole office shine.

AT&T branch to expand data security service

JACKSONVILLE, Fla. — A subsidiary of AT&T recently announced the opening of a data security service facility in Maitland, Fla. American Transtech plans to operate underground, hardened facilities in most Standard Metropolitah Statistical Areas (SMSA) around the country. An SMSA is the U.S. Census Bureau designation for metropolitan areas.

The division, based here, said it also has a facility operational for the New York metropolitan area and plans to open several additional sites in 1985, including a facility to serve North and Central Florida that is to open in January.

The data security facilities were designed to provide secure, off-site storage of data processing media. The company said the facilities typically will be underground, two- and three-story structures featuring two-foot steel and concrete exterior walls designed to be waterproof and to withstand significant external pressure.

American Transtech said bonded couriers will handle all media movements. Transportation to and from facilities is currently handled in specially designed, unmarked vans.

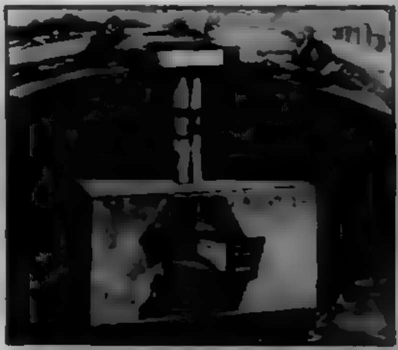
The facilities will be operated round-the-clock, every day of the year to assure client access to data. The company said vault facilities exceed standards set for data storage by various national institutes and associations.

Disaster recovery consulting

Additionally, Transtech Data Security Services will provide disaster recovery consulting for data backup programs. The company said each facility utilizes a tape archival management system providing tape maintenance, cleaning and retensioning on a scheduled basis.

William A. Hightower, president of American Transtech, said the new service "represents a logical extension of business for a company like Transtech, which handles large volumes of highly sensitive financial data for some of America's largest corporations." American Transtech was chartered by AT&T in 1983 to handle all stock and related shareowner services for the divestiture of AT&T and for the resulting new companies.

Transtech Data Security Services' offices are located at 2600 Maitland Center Pkwy., Maitland, Fla. 32751.



An artist's rendering of a typical data security facility that American Transtech planned. Vault facilities reportedly exceed data storage standards.

SURVIVAL

tention to the facts in this market.

Some of the recent questions I have been asked pertain to Commodore Business Machines, Inc.'s surprising advertising claim that it sells more personal computer units than anyone else. (Units yes — dollars no.) Many think the IBM Personal Computer buried all the competition.

The fact is that the IBM Personal Computer buried no one and did not even slow down anyone's growth. The Personal Computer created a whole new market, which apparently reflects a large personal computer segment. Many companies have prospered and more new companies have risen than fallen since the Personal Computer was introduced. The failures and slowdowns that have occurred can be attributed to normal product life cycles, product positioning and/or poor management.

The accompanying table on page 96 highlights the growth of the personal computer market segment in total and by the major companies. IBM's figures are estimated because it has not reported consistently for this breakdown, and personal computers are a relatively small portion of its total sales.

The major personal computer companies designated as "Other" in the table include Wang Laboratories, Inc., Hewlett-Packard Co., Digital Equipment Corp., Xerox Corp., Texas Instruments, Inc., Lanier Business Products, Inc., CPT Corp. and Compaq Computer Corp.

This table clearly shows that the ACT (Apple Computer, Inc., Commodore and Tandy Corp.) group's growth in sales has not been adversely affected by the IBM Personal Computer's introduction. All these companies feature non-IBM-compatible systems. Tandy, however, has started to promote an IBM-compatible line (and its overall growth has slowed). Apple, on the other hand, seems to be doing well with the non-IBM-compatible Macintosh.

Next week: the quiet demise of the IBM 5120 "impersonable" computer.

Do General Electric, Digital Equipment, GTE and Caterpillar Tractor Know Something That You Don't?

If your company is like other corporations, you're spending enormous sums of money on manuals, marketing and technical reports as well as collateral materials. By employing the latest computer technology, you can speed up the entire process, reducing the cost of producing these documents by up to 50%.

The senior executives and key management of the companies mentioned above have already discovered that *they are doing more publishing than most publishing houses.*

They are ready to tell you how Corporate Electronic Publishing Systems have saved them time and money, dramatically simplified their communications processes, earned astounding ROI's (30-60% per year) and made their companies more competitive and profitable.

Carnegie-Mellon wins DOD grant for project

By Tom Neudecker
Special to CW

PITTSBURGH — Richard D. De Lauer, undersecretary of the Department of Defense for Research and Engineering, recently announced a grant to establish a Software Engineering Institute (SEI) at Carnegie-Mellon University. The award of the $103 million, five-year contract concludes nearly one year of competition, discussion and politicking by several universities.

"The center is intended to make DOD computer systems more reliable; . . . these are problems of national significance," said Dr. Angel Jordon, provost of Carnegie-Mellon and member of the team that prepared the university's proposal.

The institute will provide some 250 jobs, 70% of which will be scientists and engineers. Carnegie-Mellon President Richard Cyert predicted that SEI will eventually result in more than 10,000 new jobs in related projects.

Hope for regional economy

Cyert heralded the announcement as an important step in improving the "Steel Valley" regional economy, which has been severely impacted by the decline of the U.S. steel industry. "I really believe that we're going to see important changes in the economy as a result of this; I see this snowballing and I don't think I am being overly optimistic," Cyert said.

To help recruit top engineers to the project, the university has secured support from several of Pittsburgh's corporations to fund professorships. This new talent is expected to provide consultation to the 400 high-technology firms already in Pittsburgh and to those expected in the future.

One of the goals of the project is to develop generic programming approaches that will allow easy interface of new program modules to future programs. These new programming tools should provide an environment that decreases the development time of software. Additionally, SEI will modify and improve existing software for the DOD.

Intense competition

Competition for the award was intense. Insiders said the competitors included the University of Maryland, Wright State University of Ohio, Texas A&M University and a consortium of other Texas schools, the University of California at Berkeley and a consortium of other California schools and Northeastern University of Boston.

Each of the competitors attempted to include local business and political support in their proposals, just as the University of Texas did in its winning proposal for the contract to establish a center for microelectronics and computer technologies in order to develop a rival to Japan's Fifth-Generation Computer Project.

The SEI project joins Carnegie-Mellon's other programs in magnetic storage, microcomputer research and robotics development. The university also intends to convert the abandoned Jones & Laughlin Steel Corp. mill in Pittsburgh into a robotics research and manufacturing center.

Neudecker, a free-lance writer based in Pittsburgh, is a frequent contributor to Computerworld.

UniForum™
The International Conference of UNIX Users
January 21 - 25, 1985
INFOMART · Dallas, Texas

OFFICE SYSTEMS

EXPERIENCE THE WORLDS OF UNIX*

UniForum '85 is your passport to the fascinating "Worlds of UNIX." You'll examine the growing impact of UNIX in Office Systems, Personal Computers, Engineering/Programming, and Market Trends at UniForum '85, the largest UNIX event ever held.

PERSONAL COMPUTERS

More than 200 major vendors, in 850 booths, will display and demonstrate all that's new in UNIX products and applications.

An extensive conference and tutorial program will expand your UNIX database. This program, organized by /usr/group, will include 14 all-day tutorials on user-specific aspects of UNIX...40 in-depth and informative conference sessions...four nationally-known plenary speakers.

In addition, a number of introductory courses in UNIX will be presented throughout the event.

UniForum '85 will be your total UNIX experience. Whether you're just getting started... or are a seasoned UNIX veteran...UniForum '85 is *the* UNIX event of the year.

Sponsored by
/usr/group
The International Network of UNIX Users

MARKET TRENDS

ENGINEERING PROGRAMMING

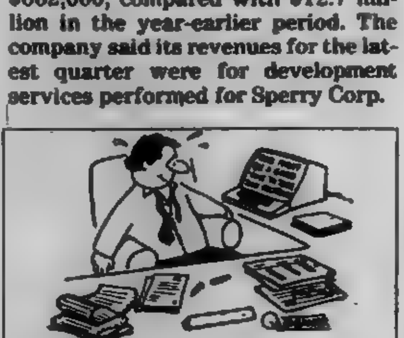
*UNIX is a registered trademark of AT&T Bell Laboratories.

Trilogy posts $5.3 million quarterly loss

CUPERTINO, Calif. — Trilogy Ltd., which in the past year has abandoned its efforts to produce a supercomputer and to develop wafer-scale integration semiconductor technology, reported a loss of $5.3 million for the quarter ended Sept. 29.

The loss, amounting to 14 cents a share, compares with a loss of $1.2 million, or 8 cents a share, for the corresponding period a year earlier. The company further reported that year-to-date losses have totaled $79 million. Those losses include a $43 million write-down in the second quarter related to the company's decisions to discontinue development of a large-scale IBM-compatible computer system, development of its semiconductor manufacturing operations in Cupertino and Ireland and the wafer-scale technology project.

Revenue for the quarter was $662,000, compared with $12.7 million in the year-earlier period. The company said its revenues for the latest quarter were for development services performed for Sperry Corp.



FORECASTS AND FINDINGS

PBX users rate Rolm tops

FRAMINGHAM, Mass. — Rolm Corp. finished ahead of AT&T in a recent survey of private branch exchange (PBX) end users who plan to purchase a replacement digital PBX during the next year to 18 months.

The study by the Market Information Center, Inc., a market research company here, found that 30% of the respondents said they planned to install replacement systems manufactured by Rolm, while 20% listed AT&T as the likely choice. Northern Telecom, Inc. and NEC Corp. were tied with 10.7% each.

Rolm was also the top choice among users who said their organizations planned to add a system, with 41.7% picking Rolm and 35% choosing AT&T.

The survey, priced at $295, is available from the Market Information Center, Suite 350, 100 Pennsylvania Ave., Framingham, Mass. 01701.

Chip vendors to up spending

NEW YORK — U.S. manufacturers of semiconductor devices plan to increase spending for automating their production processes by about 30% a year through 1993. Spending for automation will increase from a projected $83 million this year to $1.1 billion in 1993, according to a recent study from Frost & Sullivan, Inc.

The study, "The Automated Semiconductor Wafer Fabrication Market in the U.S.," concluded that U.S. chip makers are being spurred toward increased automation as a result of cost pressures from their highly automated Japanese counterparts as well as the need for enhanced quality control.

Automation of the wafer fabrication process is just one area of a pattern of increased capital spending by chip makers. The study estimated that Intel Corp., Texas Instruments, Inc. and IBM will allocate $300 million each in capital spending in 1984.

The study is available for $1,550 from Frost & Sullivan, 106 Fulton St., New York, N.Y. 10038.

Distribution channel emerging

DALLAS — Microcomputer manufacturers elbowing for shelf space are finding office product dealers are emerging as an alternative distribution channel, according to the "Office Products Dealers Survey: 1984," a nationwide study of 1,400 office products dealers.

The survey by Future Computing, Inc., an industry research firm here, estimated that $800 million of personal computer products will be handled by office products dealers in 1984. That figure is expected to increase to $3.5 billion by 1989.

Among other information, the report profiles both the typical dealer and the dealer that carries personal computer products. The profiles cover revenue, revenue and profit mix, purchasing methods, typical customers and sales personnel.

Priced at $1,500, the survey is available from Future Computing, 8111 LBJ Freeway, Dallas, Texas 75251.

Survey: Training level low

FRAMINGHAM, Mass. — More than 60% of companies contacted in a recent survey offered no level of training for their personal computer users, according to International Data Corp. (IDC), a market research firm here.

The study, "PC Training Issues for Managers and Professionals," projected that annual revenue for micro training products designed for business use will reach $616 million by 1990, up from $27.8 million in 1982.

The report is available for $195 from IDC, 5 Speen St., Framingham, Mass. 01701.

Computervision regroups

BEDFORD, Mass. — Computervision Corp., a manufacturer of computer-aided design and manufacturing systems, recently announced a major corporate realignment, including the establishment of five major groups with responsibilities for specific industries.

Under the realignment, Computervision will be restructured into five-groups, each to be headed by a group executive. James Berrett, president and chief executive officer, said the move is centered on "the concept of decentralized operations organized under major groups to serve specific industries."

Berrett called the realignment "a critical step for Computervision in growing to a billion dollars in annual sales in the next few years." The company reported revenues for the fiscal year ended Sept. 30 of $504 million.

The five units will consist of the North America Group, headed by Robert Gothie, vice-president; the Business Development Group, headed by Peter Chiasso, division vice-president; the International Group, headed by Karl Geng, vice-president; the Product Group, headed by Richard Paulson, vice-president; and the Operations Group, headed by Robert Callaway, vice-president.

All five executives formerly held the titles of division general managers.

Forte puts mainframe graphics on your PC

Get mainframe graphics right at your desk. With the ForteGraph™ Emulator.

Just add it to the Forte PJ™ communications adaptor. Without using an extra slot. You're ready to roll with a single PC keystroke.

With a compatible monitor, you'll get true 3279 model S3G emulation. From color quality and screen print speed, right down to pixel resolutions.

Dip into a palette of software, like GDDM,* SAS/GRAPH* and ISSCO's TELLAGRAF.* Create pie and bar charts, histograms and conceptual drawings. Or paint up a storm with your own custom-designed characters.

Even foreign language fonts and scientific notations can be used.

ForteGraph is entirely soft-loaded. So you can send, receive and store files while host sessions remain untouched. You can even save your mainframe graphics on your own diskettes. And print copies right in your office.

Installation? It's a snap. Because ForteGraph requires no host hardware or software modifications.

Graphic smarts from Forte. Colorful. Creative. Easy to use. And ready for you now.

5 NICKELS AND DIMES 10¢

Centronics Data Computer Corp. announced revenues for the third quarter of fiscal year 1984 of $41.8 million, compared with $38.9 million for the comparable period one year earlier. Net loss for the quarter was $1.2 million, or 11 cents per share, compared with a net loss $2.1 million, or 19 cents per share, for the comparable quarter one year ago.

■

Key Tronic Corp. reported revenues for its first quarter of fiscal year 1985, ended Sept. 22, of $1.5 million, compared with $28 million for the like period one year earlier. Profits were $1.8 million, or 21 cents per share, compared with $2.6 million, or 30 cents, for the comparable quarter one year earlier.

■

Western Union Corp. reported a net loss of $15.5 million for the third quarter ended Sept. 30, or 80 cents per share, compared with a profit of $16.6 million, or 60 cents per share, for the same quarter one year ago. Revenues were $300 million, compared with $845 million for the same period one year earlier.

■

Daisy Systems Corp. announced that profits for the fiscal year ended Sept. 30 were $11 million, or 73 cents per share, compared with $2.5 million, or 19 cents per share, for the like quarter last year. Revenues were $69.1 million, compared with $17.4 million for the corresponding quarter one year ago.

AGS Computers, Inc. announced third-quarter revenues of $56.1 million, compared with $38.7 million for the like quarter last year. Profits were $1.7 million, or 34 cents per share, compared with $1.5 million, or 34 cents per share, for the comparable period one year earlier.

■

Fortune Systems Corp. reported revenues of $16.7 million for the third quarter ended Sept. 30 — an 85% increase over the $9 million for the same fiscal period last year. A net loss of $3.6 million, or 17 cents per share, was posted, compared with a loss of $9.1 million, or 40 cents per share, for the same quarter last year.

■

Equitable Life Leasing Corp. achieved revenues for the third quarter ended Sept. 30 of $31.1 million, compared with $22.5 million for the like period one year earlier. Profits were $2 million, compared with $1.4 million for the same quarter last year.

■

Uccel Corp. announced profits for the three months ended Sept. 30 of $2.1 million, or 13 cents per share, compared with $224,000, or 1 cent per share, for the same period one year ago. Revenues were $42.7 million vs. $38 million a year earlier.

■

Science Management Corp. reported profits of $22,000, or 1 cent per share, for the quarter ended Sept. 30, compared with $188,000, or 7 cents per share, for the third quarter last year. Revenues were $16.2 million, compared with $14.7 million for the same period one year earlier.

■

M/A Com, Inc. announced fourth-quarter profits of $12.8 million, or 30 cents per share, compared with $8.9 million, or 21 cents per share, for the comparable quarter one year earlier. Revenues were $214.2 million, compared with $184.8 million for the like period last year.

■

Protocol Computers, Inc. reported fourth-quarter profits of $62,200, or 1 cent per share, compared with $559,000, or 12 cents per share, for the like period one year earlier. Revenues were $4 million, compared with $3.9 million for the same quarter last year.

■

MPI Systems, Inc. announced second-quarter results of $45,535, or 1 cent per share, compared with $319,201, or 6 cents per share, for the corresponding period one year earlier. Revenues were $2.8 million, compared with $2.6 million for the prior year.

■

Voicemail International, Inc. reported a third-quarter loss of $540,412, or 18 cents per share, compared with a loss of $540,659, or 40 cents per share, a year ago. Revenues were $556,349, compared with $283,973 in the corresponding quarter one year earlier.

■

Wicat Systems, Inc. reported revenues for the fiscal quarter ended Sept. 30 of $6.5 million, compared with $3.2 million in the like period one year earlier. Loss for the quarter was $1.7 million, or 9 cents per share, compared with a year-earlier loss of $3.5 million, or 18 cents per share.

■

Applied Computer Techniques announced revenues for the first six months ended Sept. 30 were $46.4 million, compared with $26 million in the prior year. Profits were $4.9 million, or 46 cents per share, compared with $2.3 million, or 22 cents per share, for the comparable period one year earlier.

■

Lexidata Corp. reported revenues for the fourth quarter were $10.2 million, compared with $8 million for the comparable quarter one year ago. Profits were $243,000, or 4 cents per share, compared with $88,000, or 2 cents per share, in the like period one year earlier.

■

Cray Research, Inc. reported revenues of $71.6 million for the third quarter ended Sept. 30, compared with $31.3 million for the prior year's quarter. Profits were $19.5

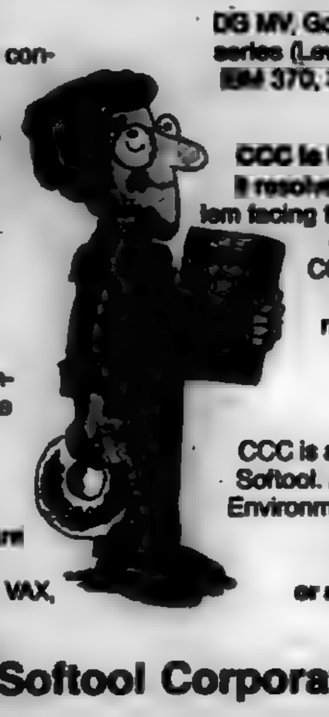
Do you still think automatic configuration management is "pie in the sky"?

Think again.
It's here. Now. Proven.
Deliverable today!

See us at DEXPO WEST booth #2840

With Softool's Change and Configuration Control (CCC™) tool, you will be in charge.



CCC Automates:
• management of changes and configurations • control over who makes what type of changes and where • tracking of trouble reports • reconstruction of previous versions • document control • management reports • archiving • and, much more.

CCC is Interactive And Friendly.
It supports all programming languages, and comes with on-line tutorials.

CCC is a Proven Product.
Over 1,000 Softool products are installed worldwide. CCC is supported on the Apollo, DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 series (Level 66, DPS 8/88), HP 9000, IBM 370, 30XX and 43XX computers.

CCC is the Solution for the 80's.
It resolves the most important problem facing the software industry today: configuration management. CCC offers *true* configuration control. . .where all components of a given release can be managed as a unit.

There is More.
CCC is a stand-alone component of Softool. An integrated Programming Environment (PE™) is also available.

Call today for more details or a hands-on demonstration.

Proven in MIL-STD Applications!

Softool Corporation

million, or $1.32 per share, compared with $2.8 million, or 19 cents per share, in the corresponding period one year earlier.

■

Micom System, Inc. for the second quarter reported revenues of $43.2 million, an increase of 44% over the $30.1 million announced in the like period one year ago. Profits were $6.3 million, or 41 cents per share, compared with $4.7 million, or 31 cents per share, in the prior year.

■

Lotus Development Corp. announced that profits for the third quarter ended Sept. 29 were $9.1 million, or 57 cents per share, vs. 1983's third-quarter profits of $4.7 million, or 35 cents per share. Revenue was $45.6 million, compared with $16.4 million for the corresponding period last year.

■

Emulex Corp. reported a first-quarter fiscal 1985 revenue of $24.1 million, an increase of 60% over last year's $15.1 million. Profits were $2.3 million, or 18 cents per share, compared with $2.9 million, or 21 cents per share, in the corresponding quarter one year earlier.

■

Altos Computer Systems, Inc. announced that revenue for the first quarter of fiscal 1985 was $33.3 million, an increase of 84% compared with $18.1 million the same quarter one year ago. Profits were $3.7 million, or 25 cents per share, compared with $1.1 million, or 8 cents per share, in the like period one year earlier.

■

Harris Corp. reported that profits in the first quarter of its 1985 fiscal year increased 38% to $25.3 million, or 63 cents per share, compared with $18.4 million, or 46 cents per share, in the corresponding quarter one year ago. Revenue was $511.7 million, compared with $432.5 million in the year-earlier period.

■

Computervision Corp. announced revenues for the third quarter ended Sept. 30 of $137.1 million, compared with $104 million in the like quarter one year ago. Profits were $11.1 million, or 39 cents per share, compared with $9 million, or 32 cents per share, for the same quarter one year earlier.

■

Data I/O Corp. reported revenues for the third quarter ended Sept. 30 of $10.5 million, compared with $10.1 million for the like quarter last year. Profits were $1.7 million, or 21 cents per share, compared with $1.8 million, or 26 cents per share, for the same period one year ago.

■

Zitel Corp. announced profits for its fourth quarter of $362,000, or 7 cents per share, on revenues of $7.1 million.

■

Automatix, Inc. reported a third-quarter loss of 40 cents per share on a revenue of $5.4 million. This compared with a net loss of 1 cent per share for the same quarter of last year on a revenue of $3.7 million.

■

General Automation, Inc. announced that revenues for the fourth quarter ended July 28 were $19.8 million, compared with $16.1 million for the like period one year ago. A net loss of $2.4 million, or 91 cents per share, was also reported, compared with a net loss of $2.7 million, or $1.04 per share, in the corresponding quarter last year.

■

Gearad, Inc. reported a net loss of $1.6 million, or 10 cents per share, for the third quarter, compared with a net income of $4 million, or 26 cents per share, in the comparable period last year. Revenue was $52.7 million, compared with $54.8 million for the corresponding period last year.

■

Computer Identics Corp. announced that for the third quarter ended Sept. 30 revenues were $2.5 million, compared with $1.4 million in the like quarter one year ago. Profits were $196,000, or 5 cents per share, compared with a loss of $19,000, or 2 cents per share, for the comparable period one year earlier.

COMPUTER INDUSTRY

MERGERS AND ACQUISITIONS

Data I/O Corp. and **Futurenet Corp.** jointly announced they have entered into an agreement in principle for Data I/O to acquire all of Futurenet's outstanding shares in exchange for 2.16 million shares of unregistered Data I/O common stock.

The acquisition will be accomplished through the merger of a Data I/O subsidiary and Futurenet and will be accounted for as a pooling of interests.

The transaction depends on execution of a definitive merger agreement and approval of two-thirds of Futurenet's shareholders.

■

Zitel Corp., San Jose, Calif., announced that the company has acquired **Gifford Computer Systems, Inc.**, San Leandro, Calif., for 250,000 shares of Zitel common stock. Gifford will operate as an autonomous subsidiary of Zitel.

■

Basix Corp., New York, announced it has agreed to acquire **Multisonics, Inc.**, Dublin, Calif., for a maximum purchase price of $5.25 million, including payments contingent upon future revenue of Multisonics, up to a maximum of $4.5 million, and a payment of $750,000 at closing.

Basix said that the purchase price, substantially contingent upon Multisonics' product sales over the next five years, is payable in Basix common stock.

■

Printronix, Inc., Irvine, Calif., announced that it has completed the acquisition of **Anadex, Inc.**, a privately held California-based company. The acquisition was completed through a merger of Anadex into a newly formed, wholly owned subsidiary of Printronix in exchange for 380,948 shares of Printronix common stock. The subsidiary will continue to conduct business with its former management under the name Anadex, Inc.

■

Computer Power Systems Corp., Carson, Calif., has become a wholly owned subsidiary of **Emerson Electric Co.**, St. Louis. Terms of the acquisition were not available.

Wang Institute photo

Wang students rarely have to wait in line to access computer equipment.

SCHOOL

from page 95

to earn the reputation of an MIT or Stanford University, its small size is a plus to some students. "I chose Wang because there was clearly a concern about me as a person and how I could develop into an excellent software engineer," said Susan Cardwell, a recent graduate who now works as a software development engineer at Hewlett-Packard Co. in Waltham, Mass., which sponsored her studies.

The school is equipped with an assortment of computer hardware and software, much of it from corporate donors. The systems include two Digital Equipment Corp. VAX systems, one running the AT&T Unix operating system and the other running VMS; a Prime Computer, Inc. 750; Wang VS100; and Apollo Computer, Inc. DN Domain Processing System. There are also a dozen or more different microcomputers for student use.

"We are a very rich computing environment," Fairley noted. "Students never have to wait in line to get access to computer equipment."

The master's program in software engineering is the only program so far in the institute's School of Information Technology, according to Fairley.

Stuff it to JES

CICS, DSPrint, IMS, and SAS* Reports

The Dynamic Report System provides a bridge between on-line systems and the JES report queues. Move it all to JES and gain performance along with centralized report distribution. Let JES account for, archive and distribute reports to 327X printers, local printers, PCs, plotters, microfilm devices and 5210s.

And Let JES Distribute Your 328X Reports

VPS, the VTAM/TCAM Printer Support subsystem places 328X/328X printers, PCs, plotters, 5210s, and word processors directly under JES. These non-dedicated devices become JES RJE print stations. VPS expands JES's local and remote hardcopy alternatives as it reduces real network costs and complexity. Ask our 400 users and their 20,000 printers.

The first 3-in-One printer smart enough to change typefaces automatically. The Toshiba P1351.

The Toshiba P1351 is the ultimate 3-in-One printer. Others come close to us on speed. Others try to approach our level of graphics sophistication. And there are even a couple of printers with a 24-pin dot matrix print head similar to ours. But no other printer has it all.

Because Toshiba has always pioneered in printer development and technology. Where we have led, others have followed. And now we've added the benefit of software-selectable downloadable typefaces.

Smart and unlimited. The Toshiba P1351 does more than give you access to three resident typefaces. It also gives you the ability to download an unlimited variety from a growing library of IBM-compatible software typefaces. They're all stored on floppy disk. And you get programming access to five typefaces at any time.

Smart and letter-perfect. Our unique high-density 24-pin dot matrix print head gives you letter-quality results from any typeface you choose. And with Qume SPRINT 5™ emulation, the Toshiba P1351 can give you those results from almost every popular word processing program.

Of course, it's fully IBM-compatible. And there's even an optional forms tractor or sheet feeder for paper handling versatility.

Smart and fast. Why sacrifice speed for letter-quality printing? The Toshiba P1351 gives you the best of both worlds. Sharp, clean letter copy at 100 cps. And even faster draft copy at 192 cps.

Smart and an eye for detail. The P1351's print head doesn't just produce letter-quality type. At 180 x 180 dots per square inch, its high-resolution graphics lead the industry. And it's supported on popular graphics software like Lotus 1-2-3.™

Smart and reliable. The Toshiba P1351 is designed and built with a very intelligent attitude toward reliability. And optional third-party 24-hour service is also available. That's why, over the past four years, more than 200,000 smart buyers have depended on Toshiba 24-pin printers for letter-quality results.

So make the smart move. To the Toshiba P1351 3-in-One™ printer. For more information, call 1-800-457-7777, Operator 32.

Lotus and 1-2-3 are trademarks of Lotus Development Corporation. SPRINT 5 is a trademark of Qume Corporation.

INTRODUCING THE AT&T

PERSONAL COMPUTER.

The personal computer game is ready for business—and now it's your move. To win the game your company needs a fast, flexible, reliable personal computer that enables you to call the shots.

Go directly to the new AT&T Personal Computer.

The AT&T Personal Computer is more than just a superior piece of hardware. Behind it is a commitment to a better way of managing information and communications. One that can pay off handsomely in increased productivity and profits.

Because our AT&T PC is designed to be flexible enough to meet all your business needs—today and in the future.

Whether you use it as a stand-alone workstation or as a team player in a fully integrated system, you'll find our PC a high-performance machine. And a hard-working addition to your office.

Its fast processing and [illegible] graphics will help make [illegible] task a computing [illegible] you can expect [illegible] More [illegible] [illegible] business applications. Financial analysis. Forecasting. Budgeting. Word processing. Inventory. The AT&T PC does it all.

And its flexibility means that when it's time to expand, our PC will actually make your computer growing pains painless.

With our unique PC Interface it can be linked to the more sophisticated, higher capacity world of the UNIX** System V Operating System—the AT&T Computer "brain" that is emerging as the operating system standard for multi-user, multi-tasking machines.

PERKS

from page 96

its staff on a six-week, fully paid sabbatical every four years.

But several Silicon Valley companies have discovered that another way to win the talents and loyalties of today's fitness-conscious workers is with a high-tech version of the college gymnasium.

Jean Hollands, a psychologist at the Good Life Center in Los Altos, Calif., specializes in helping corporate clients at IBM, HP and AT&T combat what she calls "high-tech stress." Employee fitness and image-building are becoming increasingly important corporate priorities, Hollands said. "High-ticket recreation centers help companies reduce the toll that smoking, stress and [being] overweight takes on its workers and lets companies say 'I value you,' to employees. Basically, when people feel better about themselves, they do a better job."

National Semiconductor President Charles Sporck (far right) leads area politicians and others through National Semi's employee recreational park.

According to Robert Levering, coauthor of the best-selling book *The 100 Best Companies to Work For In America*, the bottom line is return on investment rather than corporate humanism. But, Levering said, "Because these facilities definitely lower staff turnover, companies gain from higher employee productivity and increased profits. It's a win-win situation."

Computerworld took a look at four companies in the Valley who have chosen this route and found out why.

■ **Rolm Corp.** Rolm's three-acre headquarters in Santa Clara, Calif., nicknamed "the campus" by envious outsiders, typifies most people's vision of the mellow California work style. The company's $1.5 million employee recreation center, built after employees voted for it over their annual Christmas party in 1980, boasts two heated swimming pools, a sauna, several Jacuzzis, a steam room, tennis and racquetball courts, an indoor track, a full-size basketball gymnasium and a mirrored hall for fitness and martial arts classes.

According to Rolm spokesman Ken Rowe, because of the center, staff turnover has decreased to half that of the rest of the Valley.

On one afternoon, Jim Weisert, Mark Lyon and Bill Kirsch, three engineers with Rolm's technical group, relaxed on lawn chairs near Rolm's outdoor pool after jogging and swimming. "I love coming here," Weisert said over the noise of a spirited game of water polo. "It motivates me to work harder." Kirsch added, "I think the ambience here helps Rolm keep younger people. All this would definitely make it hard for me to leave."

■ **National Semiconductor Corp.** On Sept. 29, Charles Sporck, National Semiconductor's chief executive officer, and Frank Deal, National Semi's recreation park manager, formally cut the ribbon on the company's 14-acre, multimillion-dollar Employee Recreation Park, a dream of Sporck's and Deal's since 1968.

"When it's finished," Deal said, "it will be the pride of the Valley. It's a park for those who want to [play] sports and for those who just want to sit by the lake and get some sun. I think everybody here at National [Semi] will use it."

The park, surrounded by 1,000 Burn trees, boasts a lighted baseball field, landscaped paths, an amphitheater with a sound system, a 1.3-acre lake, several picnic areas, a one-mile jogging course and a central green for sports.

■ **IBM.** Paid for out of corporate coffers, IBM in 1980 converted 17 acres of fields and orchards at its San Jose, Calif., manufacturing plant into an employee recreation area with softball, basketball, volleyball, tennis and shuffleboard courts, picnic gazebos and a ¼-mile asphalt running track.

Ken Hollenbacher, IBM's manager of recreation services, estimated that 20% of the company's 10,000 West Coast employees use the recreation area regularly and said that usage is up 50% over the last two years. "Employees want to stay healthy," Hollenbacher said. "Corporate headhunting is so competitive now that companies must offer these kinds of things. IBM is no exception." IBM has just added $180,000 to the next phase of the project, he added, and will build lighted tennis courts and another softball field by mid-1985.

■ **Tandem Computer Corp.** "Employees spend a lot of time here, and we want to give something back to them," said Gina Burr, a spokeswoman for Tandem. The company gives the "something" back in the form of a four-building, 442,000 sq-ft athletic complex perched amid several acres of prime Santa Clara land. The complex includes tennis courts, a golf course, a weight room and a full-size lap pool, Burr said.

According to Tandem legend, the company's enlightened personnel policies go back to founder James Treybig, who modeled the company's corporate philosophy on the Japanese concept of "heiwa," or a state of tranquillity, Burr said. "We make sure the perks here are for all employees, not just top executives."

Tandem's turnover rate has decreased 20% since Tandem refurbished the buildings in 1979, according to Burr.

THE HARDEST-WORKING DBMS A CORPORATE HEAVY COULD ASK FOR.

You may not work for a global business with four billion customers and the world's biggest inventory.

But you can still give your executives an easy way to get at corporate data through their PCs. Without your getting snowed under with requests for information.

It's the new R:base™4000 Version 1.1.

"THE MORE PROGRAMMING CAPABILITY, THE MERRIER."

The new R:base offers greatly expanded programming capability that lets your users do conditional processing. Post transactions. And update multiple files from one input form. There's even a new applications diskette, with sample mailing list, inventory management, and prospect management applications.

Of course, R:base still lets your managers tap billions of records. Open 40 files at the same time, and handle up to 400 fields. And sort it all out before they know it.

"THE EASIEST DBMS SOUTH OF THE POLE."

The self-guided tutorial makes learning—and using—R:base a snap. Especially when it's combined with Clout,™ a software program that lets users ask questions of the database in their own words.

The result? You'll spend less time training managers and more time doing the bigger, more DP-intensive jobs.

"AVOID THE RUSH. CALL NOW FOR A DEMO."

If you'd like to try R:base, we'll send you a full demo/tutorial (with Clout as well) for only $9.95 plus shipping. Just call 1-800-547-4000, Dept. 938. In Oregon, call 1-503-684-3000, Dept. 938. Or see your nearest software store.

And show a corporate heavyweight how he could be sitting pretty.

R:BASE™
FROM MICRORIM®

Requires 256K of memory. Runs on MS™-DOS, PC/DOS,™ BTOS™ and CTOS™ operating systems.

RESEARCH SCIENTIST

The Lawrence Berkeley Laboratory's Applied Science Division is seeking a research scientist to join its Building Energy Data group. The scientist will participate in the formulation, planning, and execution and evaluation of research in the areas of measured energy performance of buildings and equipment. Performs simulations of building energy performance of major computer buildings models (DOE-2, BLAST) in the course of reconciling predicted energy use with measured energy consumptions. Supervises and coordinates all computer activities within the group, including development of data transfer protocols and software between mainframes, micros, and PCs. Prepares publications for archival journals. Requires significant research experience related to energy efficient buildings and significant experience running building loads models, preferably with DOE-2 and BLAST. Requires familiarity and experience with VAX, Unix, and CDC operating systems. Prefer a degree in Computer Science and Master's degree in an energy-related field. Please send TWO resumes to Lawrence Berkeley Laboratory, Employment Office, Building 90 Room 1042, One Cyclotron Road, Berkeley, CA 94720. Please refer to Job #A/3251. An Equal Opportunity Employer M/F/H.

LAWRENCE BERKELEY LABORATORY

DATA MANAGEMENT/ARCHITECTURE/TELECOMMUNICATIONS SPECIALISTS

RISK TAKERS

At GTE Data Services, we're not afraid to take risks...to lay our ideas on the line...to attempt what has never been done.

It's the only way to meet our corporate challenge: to develop and deploy architecturally compatible hardware/software systems—integrating voice, data and text—in a distributed data environment utilizing end user computing and intelligent workstations.

To create and implement this unprecedented subject data base environment for corporate-wide use...we must be proactive initiators, fearless innovators, dedicated to our personal best. We'd like you to share in the challenge in the following areas:

DATA ADMINISTRATION—To translate external data views into conceptual data models, you must have Data Management experience and a working knowledge of:

- Logical Modeling
- Userview Consulting
- Data Standardization
- Data Dictionary
- Information Systems Planning
- Data Administration Security

DATA ARCHITECTURE—You must have at least 5 years Data Management experience, background in relational data base applications and/or data base design/development/implementation and knowledge of:

- 4th Generation Languages
- Product Evaluation
- Problem Resolution
- Systems Support
- Data Dictionary
- Tuning Data Base Appl.Sys.

ARCHITECTURAL PLANNING—To define and lead establishment to architecture for integrated telecommunications, DP and office product network, you should have:

- Minimum of 15 years experience in telecommunications, DP, large networks and office automation
- Knowledge of network theory, data-base techniques, PABX's and fault tolerant computers
- Excellent managerial and project leadership skills

TELECOMMUNICATIONS—As a Project Coordinator involved in IM technical network architecture, your background should include:

- 8-10 years in telecommunications; data and/or voice network design
- 3-5 years in PBX design, LANs, satellite transmission or SNA networking
- 5 years in planning, budgeting or project leader capacity
- Knowledge of office and networking technology, simulation and math modeling

ALL THE ABOVE POSITIONS REQUIRE a BS, MS, or PhD in Engineering, Computer Science, Math or equivalent.

GTE Data Services, a subsidiary of GTE dedicated to Information Management, offers the challenge of a lifetime, the rewards you deserve and relocation assistance to our Florida Gulf Coast location.

Please submit resume with salary history to: N. Fitzpatrick, Dept. CWD, GTE Data Services, P.O. Box 1548, DC 136, Tampa, Florida 33601. An Equal Opportunity Employer.

ACADEMIC SERVICES COORDINATOR
University of Wisconsin-Parkside

We seek a creative individual to fill the position of Academic Services Coordinator. Individual will coordinate the academic user functions including support of statistical packages, consulting, documentation, user education, and user services activities. Individual will direct staff and students to insure that the needs for information and assistance are met.

Qualifications include a minimum of a Bachelor's degree in computer science or information management, and three years professional experience in a university computing center providing service to the academic community. A thorough understanding of the academic environment, with demonstrated ability to understand user perspective and combine it with educational and management requirements. Demonstrated technical skills including programming, teleprocessing, data manipulation, problem solving utilizing mainframe computers, use of SPSS and SAS statistical packages, written and oral communication, and management skills to direct staff and students. Experience with IBM and Digital computers preferred.

Salary depends upon qualifications and experience. Outstanding fringe benefits and advanced educational opportunities available.

Screening of resumes will commence on January 4 and continue until position is filled.

UW-Parkside is a medium-sized university in a pleasant suburban environment located in southeastern Wisconsin.

Send resume to:
William Mixemore
Director, Computer Center
U. of Wisconsin-Parkside
Box No. 2000
Kenosha, WI 53141

AN EQUAL OPPORTUNITY EMPLOYER

INFORMATION SCIENCE SPECIALISTS

The Aerospace Corporation is a private, nonprofit, public service company which specializes in space systems and their related technologies. Currently, our Information Processing Division has a number of openings for individuals with interest and background in one of the following areas.

GRAPHICS SYSTEMS ANALYST

Maintenance and modifications/expansions of vendor graphics libraries (CalComp, DI-3000, Versaplot) in-house developed graphics subroutines, conversion software for vector files, and software/procedures for distributed processing in a CDC Scope 2-NOS/BE—IBM MVS—DEC VAX VMS environment with FORTRAN being the major higher level language. Experience in Systems Programming with emphasis on graphics, preferably in a scientific/engineering oriented computational facility employing large mainframes is required.

CDC SYSTEMS PROGRAMMER

Responsible for systems installation, maintenance, user consulting and documentation on several large-scale Control Data Corporation (CDC) computers, including a Cyber 176 and two Cyber 180-835's.

Internals of the operating system is the main thrust. Experience with FORTRAN (FTN4 and FTN5) and COMPASS (both CP and PP) is required. Any experience with multimainframing and networking. Scope 2 and NOS/BE operating systems, and NOS are acceptable. We are responsible for interfacing with a large user community and are therefore responsible for consulting and documentation. Good interpersonal skills and writing capability are highly desirable.

VAX/VMS SYSTEMS PROGRAMMER

Function as System Manager for VMS or VAX 11/780 and 11/750. Responsibilities include establishment of user accounts, evaluation of system performance, system tuning, system configuration management. Other duties include assisting users with the use of the system, some system development work and installation of third party software. Applicants must also be experienced in the use of DCL and FORTRAN. Some understanding of VMS internals and experience with assembler is highly desirable.

IBM SYSTEMS PROGRAMMERS

Systems Analyst required to support an IBM 3033 and two 4341's running MVS/SP1.3. Provide SYSGEN and IOGEN support, general system debugging and maintenance as well as document selected functions and provide user seminars on selected topics. Knowledge of Assembly language and PL/I or FORTRAN are required.

COMMUNICATION SUPPORT ANALYST

Requires systems analyst experience, plus familiarity with ACF/VTAM and ACF/NCP. Responsibilities include network planning, device support and problem determination and analysis for existing and future software packages.

JES2 SUPPORT ANALYST

Requires systems analyst experience plus in-depth familiarity with JES2 including the ability to code user mods and JES2 exits.

All of the above positions require a minimum of 3 years applicable experience and a BS in Mathematics, Computer Science or other Engineering discipline.

We offer salary commensurate with experience, an outstanding benefits program including three weeks vacation your first year, tuition reimbursement and in-house educational facilities. Please direct your resume to:

Data Access Systems, Inc.

JOIN A LEADER

We lead the nation as a distributor in the sale, lease and service of microcomputers, terminals and peripherals from such quality manufacturers as IBM, DEC, TI, Diablo, Wyse, Epson, Hayes and many more. As a rapidly expanding company with 17 sales and 22 service locations across the country, we offer the right people new opportunities to make a career with DASI. We deal with Fortune 1000 corporations, have an excellent product line, a multimillion dollar inventory and our own on-site maintenance.

Sales Reps: We are looking for people with a high energy level, at least 2 years experience in the sale of PC's, terminals and telecommunications. We supply you with all the necessary sales tools including good territories, an excellent base salary, high commissions, company car and full benefits package.

District Sales Managers: Work for us if you are a dynamic self-starter with a proven management track record in the sale of PC's, terminals and telecommunications. With openings nationwide, we offer you an excellent base salary, high commissions, overrides, company car and full benefits package.

Regional Managers: Here's an excellent career opportunity for two accomplished Sales Management professionals to take charge of multiple District Sales Offices. One in the East and the other in the Central Region. Bring a proven track record in generating top line results from a remote sales force through managing managers, and a solid knowledge of the PC, terminal and telecommunication marketplace, and one of these positions may be yours. Excellent base salary, company car and full benefits. Degree required. Some travel required.

Marketing Manager: We want a real achiever with a minimum of five years computer industry experience in the PC, terminal and telecommunications area. Field sales experience helpful. Report directly to the President in this high salary plus bonus position. Corporate office location in suburban Philadelphia. Degree required. MBA preferred.

If interested in any of the above positions, please send resume, in confidence to:

An Equal Opportunity Employer DAS

SR. PROGRAMMING SPECIALIST

An opening exists for a seasoned professional who is a self-starter and who enjoys *programming* state-of-the-art systems.

Reporting to the Director of MIS, Power Conversion Group, responsibilities will entail the programming of systems that will address the needs of management at both the plant and Group level.

Specific applications at the plant level entail the bar-coding of ASK manufacturing software modules, and the development of both CAM and micro-computer applications geared to improve user productivity. Experience on the HP-3000 with a command of Fortran, and a working knowledge of Cobol is required.

Specific applications at the Group level entail programming micro-computer applications relative to the Marketing, Sales and Financial areas, and the transferring of data from/to the HP-3000. A working knowledge of micro-computer software (dBase II Wordstar, etc) is preferred but not required.

The ideal candidate will have a B.S. in Computer Science plus 10 years experience.

The Power Conversion Group is a dynamic organization which offers rich rewards to top performers. For immediate consideration send resume to [illegible].

Developing the world's most advanced systems software requires exceptional talent.

For 25 years, Applied Data Research has been the "driving force" in software development. Many of the innovations we introduced years ago are now considered industry standards. Many of the software systems we are developing today will no doubt become the standards of tomorrow.

Currently, ADR software development professionals in Princeton, NJ and Dallas, TX are taking an innovative look at 4th generation systems software for IBM mainframe and personal/micro computer technologies. Individuals interested in associating themselves with this "world-class" development effort should be experienced in any of the following areas:

SYSTEMS SOFTWARE DEVELOPMENT

-4th Generation Languages
-Data Base Management Systems
-Word Processing/Electronic Mail
-Performance Measurement/Capacity Planning
-PC/Mainframe Communications
-Operating System Extensions

TECHNICAL SUPPORT SERVICES

-Data Base Administrators and Consultants
-MVS/DOS/VM Technical Support
-Systems Programmers (MVS/VTAM/NCP)
-Systems Analysts/Programmers (DB/DC)
-Human Factors

Applied Data Research offers an excellent program for professional development, relocation assistance, and a compensation package which is fully commensurate with your education, experience and potential. For immediate consideration forward your resume or call Mr. Gary Johnson, (201) 874-9000, **APPLIED DATA RESEARCH, INC.**, Route 206 & Orchard Road, CN-8, Princeton, NJ 08540.

DATA PROCESSING OPPORTUNITIES

Juneau and Anchorage, AK

DATA BASE ADMINISTRATOR
Salary: $47,500 to $52,000/year plus benefits

The State of Alaska has a current vacancy located in Juneau. This is a supervisory position with responsibility for the development, analysis, design control and management of the State of Alaska data base systems.

Minimum qualifications are: three years of data base management systems experience on a system equivalent in size and complexity to IBM, IMS, Total Systems 2000, RAMIS, IDMS, or ADABAS, including one year of experience equivalent in kind and level to Data Base Specialist with the State of Alaska, PLUS three additional years of computer programming and/or systems analysis experience.

Note: The State's DBMS is ADABAS and preference is given to applicants with ADABAS experience.

DATA BASE SPECIALIST
Salary: $43,500 to $47,500/year plus benefits

Open recruitment is underway in order to find additional qualified candidates in the event of future openings. Positions are located in Juneau and Anchorage, and perform the full range of data base requirements in support of user activities. These include DBMS design, definition, organization, security, efficiency, documentation, generation, long term requirements, and operational guidelines.

Minimum qualifications are: two years of data base management system experience at a level equivalent to Systems Analyst II, EDP Programmer IV, or Systems Programmer II with the State of Alaska on a system equivalent in size and complexity to IBM, IMS, Total Systems 2000, RAMIS, IDMS, or ADABAS.

One year of experience listed above must have been in the analysis and design of data base applications and/or data base administration, PLUS at least three additional years of computer programming and/or systems analysis experience.

Send official State application or resumes to: Recruitment Coordinator, Pouch C-0201, Juneau, AK 99811.

THE STATE OF ALASKA IS AN EQUAL OPPORTUNITY EMPLOYER. WOMEN AND MINORITIES ARE ENCOURAGED TO APPLY.

State of Alaska

Mark IV Systems Programmers

Take up the Aramco challenge!

Aramco is the largest oil-producing company in the world. When you join us in Saudi Arabia, you will work on challenging projects that will utilize your skills to the fullest.

You will work in the material supply organization and be responsible for designing, accessing, modifying, and analyzing systems using Mark IV.

You must have a degree in Math, Computer Science, Engineering or Business Administration and have 5 years experience with Mark IV including familiarity with transaction and file coordination processing in IBM MVS 308X environment. Familiarity with FOCUS language is also desirable.

We offer an excellent salary and special benefits including long vacations, free medical care in Saudi Arabia, comfortable living arrangements, good schools and a wide range of recreational opportunities.

If you are qualified and interested in adding an absorbing international chapter to your career, please call Dr. M. Trujillo at 1-800-231-7511 or send your resume in full confidence to: Dr. M. Trujillo, Aramco Services Company A-070-4, P.O. Box 4530, Houston, TX 77210.

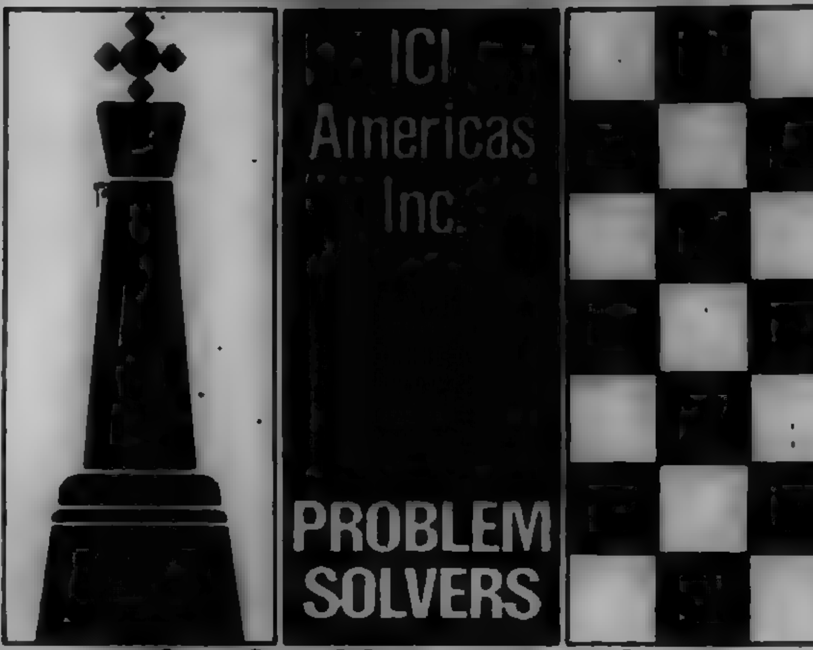
ATTENTION BUSINESS & SCIENTIFIC MIS PROFESSIONALS



Why Should You Consider A Career With ICI Americas?

Challenge/Recognition/Career Growth

These are just a few of the many advantages of working for ICI Americas (1983 sales exceeded $1 billion), the U.S. subsidiary of a major multi-national corporation. If you would like non-routine assignments, creative problem solving, and the opportunity of working with top-notch professionals on meaningful projects, we would like to hear from you. Due to our rapid growth, several new positions have been added to our dynamic corporate MIS Department. These positions support all major business functions including manufacturing, marketing, finance, and R&D throughout the Company.

Sr. Business System Analyst — 5+ years experience including project responsibility for implementation of manufacturing, financial or marketing systems in a large IBM mainframe environment. Experience in MRP II, DRP, Quality Control, or Automated Warehousing is a plus.

Sr. Scientific Analysts — The positions require individuals with 3 to 5 years of experience in one of more of the following: development of structure activity relationships, computational chemistry, chemical graphics, applied statistics, chemical data management, instrument interfacing and laboratory information systems. An advanced degree in the physical sciences, and VAX/VMS experience are preferred. FORTRAN experience is essential, as well as strong verbal and written communications skills.

Programmers/Analysts — Excellent advancement opportunities for people with 2+ years in OS/MVS, COBOL, TSO/SPF or DOS/VSE and CICS/DLI in programming complex business, financial and marketing systems.

Data Base Analyst — 3 or more years data processing experience with a working knowledge of IMS DB/DC and either COBOL or assembler, as well as IMS backup/recovery utilities.

Operations Research Analyst — BS in OR or Business, Industrial Engineering with major in OR, MS or MBA preferred. Minimum three years of experience in applying OR techniques such as LP, Forecasting, Econometrics, Financial Modeling, Simulation, Statistic or Decision Analysis. Experience using FORTRAN, SAS and Financial Model languages (FCS, 1-2-3) a definite plus; looking for results-oriented individual.

OS/MVS Systems Programmer — 3-5 years of solid MVS operating system support experience, including system generation, maintenance (SMP4) and program product installation. A good knowledge of TSO, ISPF, ACF/VTAM and SAS is preferred with exposure to either IMS/VS or CICS/VS a definite plus.

Information Center Positions — Mature IC has positions for Personal Computer Programmer Analyst and Time-sharing Technical Consultant (project leader). Experience required in fourth generation languages (SAS, FCS, INQUIRE) and PC software (BASIC, C, 1-2-3 or PASCAL). Both positions involve hardware and software evaluations and user support.

These positions are located at our corporate headquarters, a campus-like complex in suburban Wilmington, DE. ICI offers salaries fully commensurate with the required experience, excellent benefits including a generous relocation policy and ample growth opportunities. Delaware, "the small wonder" state, offers cosmopolitan living without the high costs and other drawbacks of big city living. Why not invest 20 cents in your future by sending your resume including salary requirement, in confidence to: **James H. Kline, Dept. CW-3, ICI Americas Inc., Wilmington, Delaware 19897.** *An Equal Opportunity Employer M/F*

Sr. Systems Analyst

Florida location

Burroughs Corporation, an international leader in computer technology, has an exceptional career opportunity available for a Senior Systems Analyst at our Boca Raton, Florida facility.

In this position, you will be responsible for the development of productivity tools for UNIX based minicomputers. To qualify, you must have a Bachelor's degree in Computer Science (Master's preferred), at least 2-3 years in a UNIX* programming environment and knowledge of "C" language.*

Burroughs offers excellent salaries and benefits, including relocation assistance to beautiful Boca Raton—where you'll enjoy a unique blend of cosmopolitan culture, suburban living in the natural beauty of the tropics and NO state income tax. For immediate, confidential consideration, please send your resume with salary history to:

Kay Casey

Burroughs
THE QUESTION ISN'T WHO'S BIGGER.
IT'S WHO'S BETTER.

WGE Wayne Green Enterprises, Inc.

Fast growing hi-tech firm in south New Hampshire region has the following career opportunities:

Free-lance Writers

N.H. consumer magazine on telecommunications seeks free-lance writers for articles on local area networks, electronic mail, office automation, cellular radio and mobile phones, micro-to-mainframe connections, PBX systems, paging systems, facsimile transmission and other topics related to the flow of information. The magazine will cover the communications field as it applies to business—more specifically the middle manager and small businessman. If you have a knowledge of the communication field and a flair for writing **contact [illegible] in writing or by phone at [illegible].**

Editors

N.H. consumer magazine on business communications currently has 2 openings on its editorial staff. We seek a technically oriented editor who is familiar with the telecommunications field. The ideal candidate will be comfortale with such topics as local area networks, electronic mail, micro-to-mainframe connections, hard copy transmissions, cellular radio, etc. Past publishing experience is a plus but knowledge of telecommunications is essential. We also seek an editor with a background in copy editing and production flow. A knowledge of computers and telecommunications is helpful, a familiarity with publishing and a love for the language is an absolute necessity.

Good benefits. Non-smoking environment. Send resume to **Kathryn Garrett, Personnel Director, Wayne Green Enterprises, WGE Center, Peterborough, NH 03458.**

S/38 Systems Analysts

ITT Transportation Distribution Services, located in Palm Coast, Florida, is currently seeking dynamic, well qualified individuals.

The successful candidates will be responsible for various systems development efforts relating to transportation, cost accounting, accounts payable, accounts receivable, and PC networking.

The qualifications required include:

- **Excellent knowledge of S/38 COBOL, RPG III, CLP**
- **Proven track record in applications development**
- **Good communications skills/customer interface**
- **Bachelor's degree in Computer Science**

We offer a salary commensurate with experience as well as an excellent benefits package including relocation assistance. Please send resume and salary history in confidence to: J. Loudis, ITT Transportation Distribution Services, P.O. Box [illegible], Palm Coast, FL 32037.

KEY ENGINEERING OPPORTUNITIES

Systems Research Laboratories, Inc., located in one of the lowest cost-of-living areas of the country, is a 30-year-old R&D company. We're a growing company, and because of our continued expansion we have these professional career opportunities available:

Principal R&M Engineer — Lead the corporate R&M efforts. 5-8 years working knowledge of MIL SPECS 217, 756, 780, 470 & 472. History of successful R&M program development and implementation is a must.

Managers of Systems Engineering — 10 or more years of experience in logic design, digital systems design and digital signal processing. Current experience in Radar, Avionics, EW, ELINT/SIGINT.

Sr. Electrical Engineers — 5 years diverse experience in such areas as computer interfacing, software, circuit design, electro-optics, displays and video circuitry.

Digital Design Engineers — 3 or more years experience designing digital signal processors, digitally controlled receivers, radar video scan converters, real-time graphic display systems.

Scientific Programmers and Scientific Systems Analysts — Multiple opportunities available for individuals with experience in scientific real-time environment. Includes math modeling, simulation and analysis on mini-computers and microprocessors.

Analog/Video Engineers — Experience designing complex systems, flight training simulators, electro-optic systems and high resolution display systems.

Human Factors Research Engineers — Many challenging areas.

Systems Engineer — Multiple opportunities available in developing programs for real-time flight simulation. BS with strong background in math, computer graphics, and RSX/UNIX operating systems, and 3 years experience.

Program Managers/ Project Engineers — 2 or more years current management experience at the program or project level. Requires experience in sophisticated electronic systems (displays and/or simulators) with a previous background in analog or digital design.

Manufacturing Engineers — 3 or more years current experience in the manufacture of sophisticated electronic systems.

Investigate a high technology career position with us. We offer competitive salaries based on experience, comprehensive benefits, advancement opportunities, and a working atmosphere that encourages personal responsibility in a high technology environment. For immediate consideration, send your resume in confidence to: A.J. Davis, SRL Human Resources Department.

COORDINATOR FOR ADMINISTRATIVE COMPUTER SERVICES

UNION COLLEGE OF NEW YORK

The Office of Computer Services is seeking an Administrative Services Coordinator, one of three senior positions in the department. The successful candidate will have 3-5 years of data processing project management experience, a proven ability to work with individuals and groups, and very good communication skills.

The Coordinator is responsible for all administrative software and services, and oversees the activities of programming project teams involved in software development and maintenance.

Union College is a highly selective independent residential college of about 2,000 undergraduates, offering liberal arts, engineering and computer science curricula along with a small graduate program.

The College is located in New York State's Capital District Area near the Adirondacks, and the region offers a wide variety of educational, cultural and recreational opportunities.

The position is available January 1, 1985. Special consideration will be given to candidates with any of the following: an advanced degree in an appropriate discipline, expertise with the HP3000 computer system, or management experience in an academic environment. The college encourages applications from women and minority group members. Salary $27,000 to $35,000 DOE. Wage benefits generous. Write, including full resume plus contact information for three references, no later than December 21, 1984 to:

George R. Richards, Director of Personnel
Union College, Schenectady, N.Y. 12308

EDUCATION

Your Strategic Career Choice

Does your career need a strategic boost? If so, you should consider Dartmouth's professional program in the design and management of information systems.

Our two-year Master's program is designed to equip tomorrow's information systems managers to play a leading role in the design and development of effective business solutions to business problems. We offer a blend of technological, management, and communication skills, and a record of career advancement.

Students in Dartmouth's CIS Program spend one term as interns in a variety of sponsoring organizations. On campus, they study the broad fundamentals of information systems, networks and distributed processing, current analysis and design methodologies, database management systems, communication and management skills crucial to effective planning and implementation, and the social, ethical, and organizational issues related to information systems. Case studies and guest lectures by practicing managers of information systems and professionals-in-residence are regularly featured.

If you have previous experience in the computing field but want to be equipped to assume more responsibility and leadership, why don't you consider joining us next year? For more information, write:

It's easy to advertise in COMPUTERWORLD. If you don't have an advertising agency to supply us with copy, layout and order, or a camera ready mechanical, stat or film negative of your ad, just call one of our ad-takers at 1-800-343-6474. They will be glad to take your ad and typeset it in available fonts at no extra charge. If you have lengthy ads that require logos and artwork, just send a clean typewritten copy of your ad to the classified advertising department at COMPUTERWORLD (telecopier service is available): note the ad size you want; and, if you want your company logo to appear in your ad, please be sure to include a camera-ready copy with your insertion order. You should also supply any special borders, headlines and artwork that you want in your ad. Our Production Department will follow your suggested layout as closely as possible if you wish to send one.

Ad closing is every Friday,
8 working days prior to issue date.

Rates: Open rate is *$144.90 per column inch. Minimum ad size is 2 columns inches (1 column wide by 2 inches deep), and costs *$289.80 per insertion. Additional space is available in half-inch increments. Per agate line the cost is *$10.35. Some sample sizes and costs are shown.

1 column x 4" - *$579.60
2 columns x 4" - *$1,159.20
2 columns x 5" - *$1,449.00
2 columns x 8" - *$2,318.40

Discounts are available when you run more than 35 column inches of advertising in a year anywhere in Computerworld. Box Numbers are available, *$15.00 per insertion.

To reserve space for your ad, or if you'd like more information on Classified Advertising in COMPUTERWORLD, call our office nearest you.

There's only one name you need to know in leasing.

Greyhound.

When it comes to equipment for your company, there are a lot of decisions to be made. Decisions like whether you purchase or lease, where to actually find the equipment you need and how to finance it.

To make those decisions, all you need to know is Greyhound Capital Corporation. Whether you decide to lease or purchase, we'll work with you to customize your equipment for your particular business. And we'll also work with you on the financing of that equipment.

At Greyhound Capital Corporation we've been leasing, servicing, refurbishing, maintaining and providing financing for computer and other equipment for over 20 years.

So the next time you have a lot of decisions to make about high-tech equipment, make them easier. Call Greyhound Capital Corporation.

COMPUTERWORLD CLASSIFIEDS—
—*PROGRAMMED TO HELP YOU*

The computer industry is dedicated to developing greater efficiency and valuable time-saving resources for the business world.

Well, so are *Computerworld Classifieds.*

And we can deal with a lot of problems. Our classifications include:

Position Announcements – To help you find the computer professionals right for you.

Positions Wanted – For individuals seeking full-time, permanent positions - no company ads are allowed.

Buy, Sell, Swap – For those seeking to buy, sell or lease computer equipment.

Time & Services – For companies who want to offer computer timesharing or other computer-related services.

Software For Sale & Software Wanted – Used for buying & selling software packages.

Business Opportunities – For those seeking individuals or partners in computer-related business ventures, mergers, or franchises.

Real Estate – For those seeking to sell or lease office space suitable for computer rooms or computerized businesses.

Bids & Proposals – Used to request for bids on equipment or to invite proposals for desired computer acquisitions.

Here's the data you need to know to place your ad:

The deadline for classified advertising is ten days prior to the issue desired. (That's six working days prior to the issue date). Ads may be sent in by mail. For camera-ready ads, a velox or negative is required. For ads to be typeset by us, enclose a layout if needed, along with any logos or artwork you would like to include in the ad. These must be dark and clear for reproduction purposes.

Our ad takers will be happy to take smaller sized ads over the phone. We can provide simple line borders for you, if desired.

We also provide telecopier service at extensions 410 and 451.

The open line rate is *$10.35 per line and there is a minimum size ad of 2 column inches (28 lines) at a cost of *$289.80. Column inches are calculated by multiplying the number of columns wide by the number of inches deep that your ad is. Depth increases in half-inch increments and we accomodate up to 5 columns. Column widths are as follows:

1 column	–	*1 13/16" or 11 picas*
2 columns	–	*3 13/16" or 23 picas*
3 columns	–	*5 13/16" or 35 picas*
4 columns	–	*7 13/16" or 47 picas*
5 columns	–	*9 13/16" or 59 picas*

If you wish a box number to be assigned to your ad, it will cost an additional *$15.00.

First-time advertisers must send either payment or a purchase order along with their ad.

So, whatever the problem, simply supply us with the data we need to help you on your way to a solution, quickly and efficiently.

If you wish to reserve space, or would like more information, call us at 1-800-343-6474 or (in Mass.) 617-879-0700. All materials should be sent to:

COMPUTERWORLD Classifieds
Box 880, Framingham, MA 01701

The Bulletin Board

Our Low-Cost Way to Sell Your Equipment in Computerworld

What Is The Bulletin Board?

We have a classified section designed to help you buy or sell individual software and hardware. It's especially suited to companies with a piece of used equipment for sale. For one low price, you can advertise to over half a million Computerworld readers nationwide.

How Does The Bulletin Board Work?

- The Bulletin Board is designed to advertise only one piece of equipment or software per unit.
- Units are one column wide by one inch deep at a cost of $130.00 per column inch. Although several units may be purchased for one advertisement, there will be no quantity discount.
- All ads are standard in format and typeface. No special typeface, borders or logos are allowed. Copy may be up to 25 words per unit.
- The Bulletin Board ads are listed by manufacturer or by product type under appropriate headlines.
- Ads are set on a six-column page in our classified section under "The Bulletin Board".

How to Place an Ad in the Bulletin Board:

- We suggest you prepare your ad before contacting us. Here are some guidelines:
  The first line is set in larger, bold type and should contain standard equipment identification.
  The body copy should describe the equipment and state the price.
  The closing should supply the seller's name and telephone number.
  This is all the information an interested buyer needs for follow up.
- Ads are accepted by mail, phone or by telecopier.
- Deadline is 7 days in advance of Monday issue.
- If you have never advertised with Computerworld, we request a check with your order.
- The Bulletin Board ads are not agency commissionable nor may they be applied to contract advertisers inch count.
- We assume no liability for errors beyond the price of the ad.

Here's the Address and Phone.

ORDER FORM
COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be cleanly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commisions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's
Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Business Opportunities and Real Estate).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines.

Cost: Our rates are $128.10 per column inch. (A column is 2" wide.) Minimum size is two column inches (2" wide by 2" deep) and costs $256.20 per insertion. Extra space is available in half-inch increments and costs $64.05. Box numbers are $15.00 extra.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE.

Ad size desired:__________columns wide by__________inches deep.

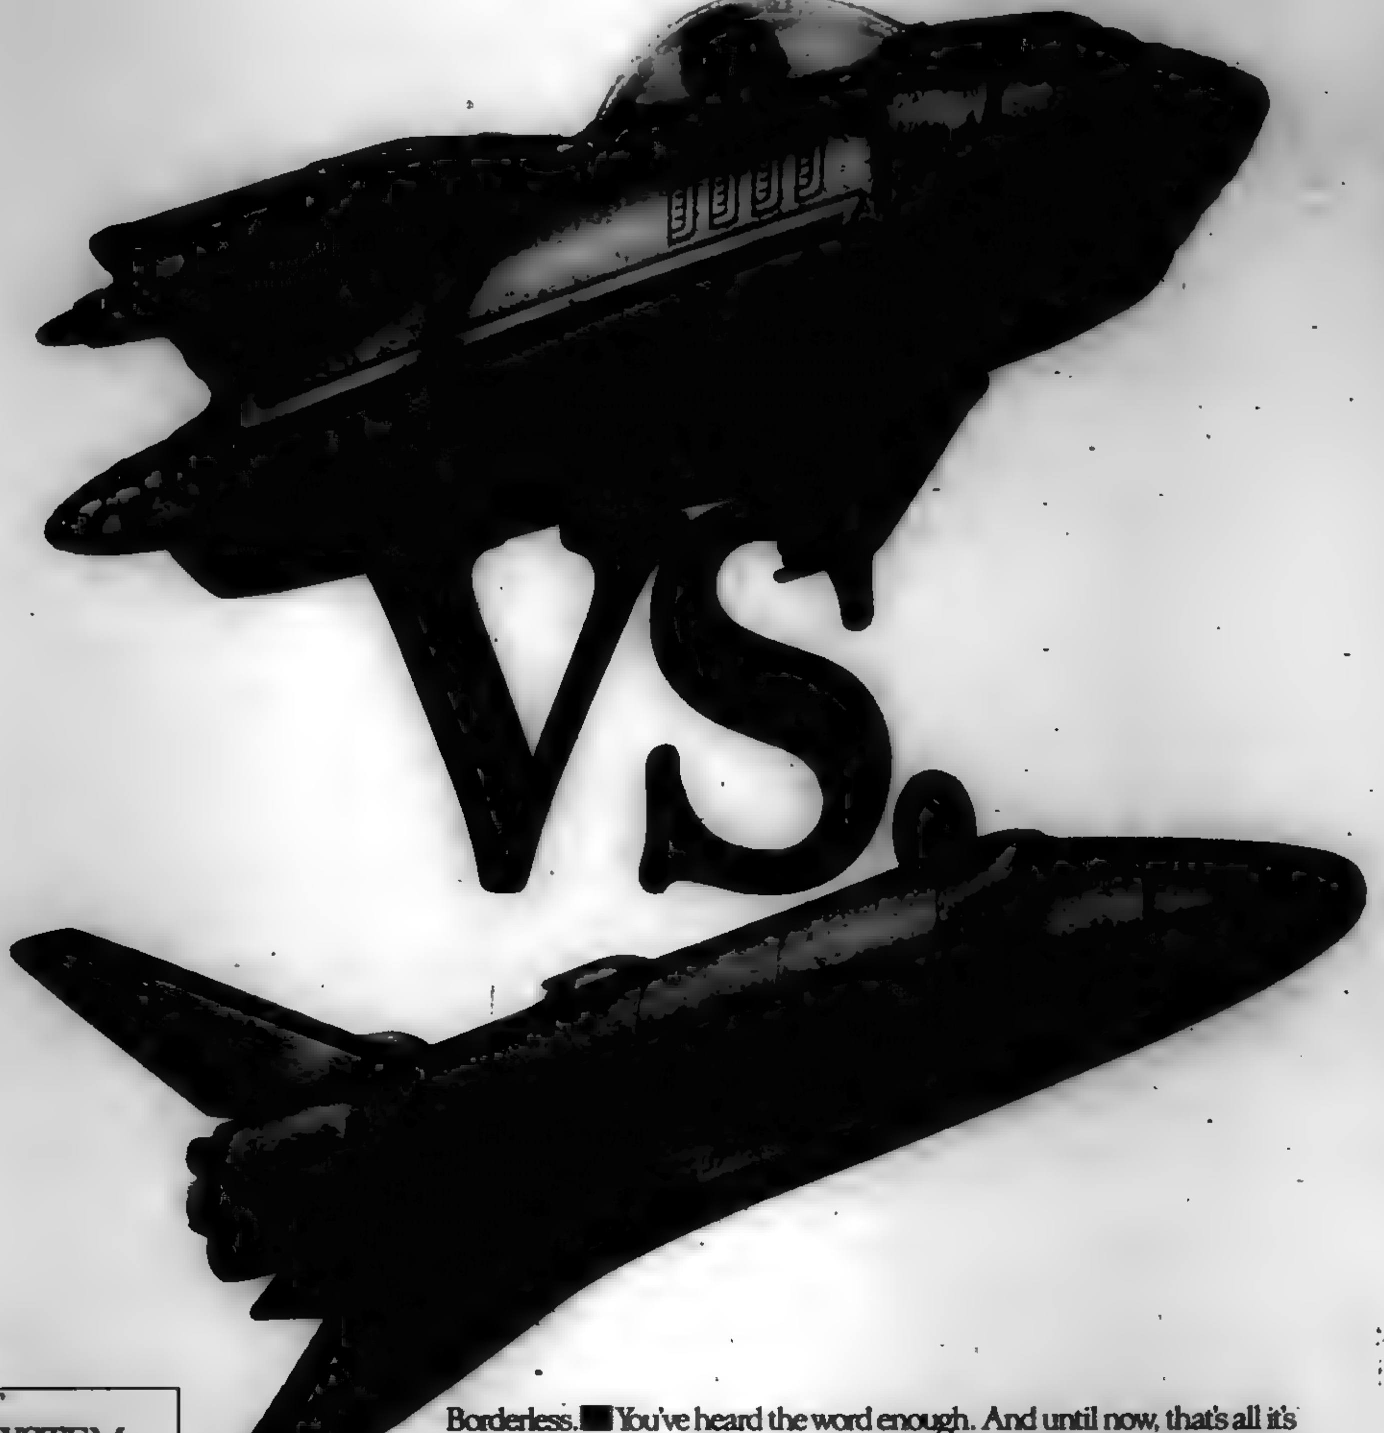
MSA WE ADD THE GENIUS TO COMPUTERS.™

The Software Company



MEET THE SYSTEM THAT MAKES BORDERLESS FACT. NOT FANTASY.

INFORMATION EXPERT™

Borderless. ■ You've heard the word enough. And until now, that's all it's been. A word. Not reality. ■ But Management Science America has changed that for good. ■ Introducing Information Expert™ (I.E.). The new mainframe software tool that gives you the level of system integration that some companies have been promising. But not delivering. ■ I.E. is truly borderless. ■ It removes the barriers between systems. Between the individual user and accounts receivable. And accounts payable. And general ledger. And more. So that the individual user can retrieve information and design reports from several application programs at once, even if they aren't all MSA programs. Simply and quickly. At one online terminal. ■ And I.E. is designed to meet the needs of a broad cross section of users. It's easy enough for first-time users—because commands are in plain English. And powerful enough for the most advanced DP specialist. ■ And I.E. also gives you higher levels of security than most other systems. ■ Only MSA gives you I.E. ■ It's a giant technological step into the future from the company that has quietly led the way in application software development. It will now be a part of all software MSA provides. The result of 3½ years of intense research and development, it's the tool that has taken the concept of total "system integration" out of the realm of theory and into the realm of fact. ■ To find out more about I.E., contact Robert Carpenter at (404) 239-2000. ■ Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326. ■ I.E. from MSA. ■ It's one more way we're adding the genius to computers. ■ Today and tomorrow. ■ © 1984, Management Science America, Inc.

1985 National Database & 4th Generation Language Symposia

Washington, DC March 18-21 • Toronto April 1-4 • Los Angeles April 16-19 • Chicago May 14-17 • New York June 17-20

Presented by Digital Consulting Associates, Inc.

The NATIONAL DATABASE & 4TH GENERATION LANGUAGE SYMPOSIUM is designed for those who need information on 4th Generation Languages, DBMS, software productivity tools, Information Centers, and/or prototyping. It features an intensive product-oriented discussion and seminar program showing how the new generation of software can be profitably used to build systems both for the DP Department and the end user in the Information Center.

DAY ONE features two concurrent sessions covering the important concepts of data management technology. These two sessions are designed to meet the different needs of management, the experienced DBMS practitioner, the DP professional, and the end user. No other conference, seminar, forum or publication offers this unique program format to provide timely, accurate software information.

SYMPOSIUM CHAIRMAN

Dr. George Schussel, *President, Digital Consulting Associates, Inc.*, is one of the best known and most widely respected lecturers on DBMS and 4th Generation Languages. Dr. Schussel will lead the Management Concepts Session on DAY 1 of the Symposium with the expertise and experience which prompted ICP INTERFACE MAGAZINE to call him the "Guru of Data Base Management"

GUEST LECTURER PRESENTATIONS BY THE WORLD'S SOFTWARE LEADERS:

Dr. Edgar (Ted) Codd
Independent Consultant

Independent Consultant

President

VP International Operations
Cullinet Software

President
Cincom Systems

Ronald G. Ross
Founder
Ronald G. Ross Associates

SOFTWARE PRODUCT PRESENTATIONS

On DAYS 2, 3, and 4, the Symposium features one hour presentations on the outstanding 4th Generation software products available today. A partial list appears below:

VENDOR	(DB + 4GL PACKAGES)
Applied Data Research	DATACOM/DB, IDEAL, DATA DICTIONARY
Battelle	BASIS, DM
Burroughs	LINC
CGI Systems	PACBASE
Christensen Systems	TELON-ADS
Cincom Systems	TIS, ULTRA, MANTIS
Cognos Corp.	POWERHOUSE

EDITORIAL

Nothing remains the same in the computer industry. The impetus for change is too strong and potential gains in revenue, productivity and quality of work too great for vendors, MIS managers or users to be satisfied with the status quo for very long.

Office automation, for example, is in some ways changing very rapidly and in others moving very slowly. Microcomputers have become the driving force in OA and have opened up vistas of information power to end users. The demand for more computing capacity has become insatiable.

The speed with which all this is happening is breathtaking. Until 1983, the equipment cost per factory worker exceeded that for a white-collar worker. Last year, for the first time, white-collar equipment costs — technology — outpaced that of factory workers, signifying a shift in the whole economy.

At the same time this demand for technology is rising, other factors are working against true OA. Overall planning is still uncommon; coordination of technology with business goals and procedures is rare; and training, ergonomics and implementation are too often glossed over, frequently to the detriment of the current and future system. OA has always suffered from a lack of sharp definition — it can mean too many different things to too many different people. Although some of the technology is in place, it is not being utilized to full capacity. OA is not just a set of applications or a checklist of technologies. It is that, of course, but it is also a change in the way we work — a change that is occurring slowly and with difficulty.

Because the nature of the industry is evolving and our readers' needs are changing, *Computerworld OA* will also be undergoing some transformations. This is the last issue of *Computerworld OA*. We believe we have an even better idea in store for you for '85. Through extensive reader and market research, we have determined how to help you stay on top of what's happening. On Jan. 16, *Computerworld* readers will receive the premier issue of *Computerworld Focus*, a whole new concept in editorial coverage for us. In 10 issues next year, we will present concise, tightly integrated packages of articles covering the trends, state-of-the-art products, analysis, issues and news by top experts in the field as well as by our own staff. Rather than cover end-user computing in general, we will deliver to our MIS readers in-depth coverage on the industry's hottest topics. We will provide you with all you ever needed to know about micros, OA, Unix, software, business graphics, networks and even factory automation. We'll concentrate on one topic in each issue, so we'll be able to tell you what's happening where, when and for whom.

You as an MIS manager are already or soon will be deeply involved in planning, selecting and implementing technologies and products in these areas. If not, you *should* be. We're excited about the changes in store; we feel they will provide that very special perspective and critical information resource you'll be needing. We won't report on everything that happens — only on what's important. And we'll tell it in a way that you, your staff and (even) your boss will be able to benefit from.

We thank you for your enthusiasm and loyalty to *Computerworld OA* and promise you an even better package next year — *Computerworld Focus*. From myself and the staff, Merry Christmas and Happy New Year!

LETTERS

GIBBERISH OVERLOAD

Your editorial in the Aug. 15, 1984, issue of *Computerworld OA* asked what it was that was keeping users from attending computer shows.

In my opinion, there is one reason for the lack of interest shown at, and therefore in, computer shows of late: INFORMATION OVERLOAD. I recently attended the Federal Computer Conference. (I had received a "free" invitation to this exposition — only to see the same "free" pass published in the *Washington Post* a few days before the show opened.)

Within one hour, I could not tell you the difference between a modem and a VDT, between local-area networks and long-distance telecommunications, between professional computers and office automation equipment. My feet hurt. I got no in-depth answers from the salespeople (who were not trained to answer in-depth questions), and I heaved home a lot of product literature that did not address my needs.

As I left the convention center, I felt like part of the madding crowd — ready for the padded cell.

Having noted that certain major computer and office automation firms were not present, I determined why IBM sells so well: "IBM" takes up much less room in my brain than does the roomful of gibberish I had just left.

Ellen L. Bouwkamp
Washington, D.C.

STANLEY

DOES ARTIFICIAL INTELLIGENCE SCARE YOU?
WHAT DO YOU MEAN?
©1984 JOHN STEVENS
DO YOU THINK STANLEY WILL EVER GET SO SMART THAT HE TAKES OVER OUR OFFICE?
I'M ALREADY TOO INTELLIGENT FOR THAT!

Computerworld Focus

Computerworld Focus will be published 10 times in 1984. Remember, it's *your* publication. Send comments on what you like, don't like or want to see included to The Editor, Computerworld Focus, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

CW subscribers will continue to receive issues as part of their subscriptions.

ADR® WARE™
ADR/eMAIL®

You may be just one program away from true office automation.

ADR/eMAIL is the software that makes the automated office truly automated.

It starts with speed. ADR/eMAIL delivers information throughout your organization—be it across the hall or around the world—at close to the speed of light.

But speed is hardly all of it. ADR/eMAIL will also file your messages electronically, discarding the ones you choose to discard. It provides an index showing author, subject and date, just like a paper filing system. But without taking the time or space of a paper filing system. Any e/MAIL message you want to locate, you can. Instantly.

When you receive your mail through ADR/eMAIL, you can read it, make notations on it, even forward it, just like an ordinary letter. But it exists electronically so it can't be misplaced like an ordinary letter.

ADR/eMAIL allows you to route your message to as many people as you wish. Or as few. Whichever you prefer. You can store routing lists of the people you frequently copy, and ADR/eMAIL will send them all messages at the touch of a button. You can assign an urgency to your message to make sure it gets priority treatment. And ADR/eMAIL will inform you when it has been viewed. ADR/eMAIL security features insure that only the parties you choose receive your message. And message encryption is available for even more sensitive environments.

And talk about having your cake and eating it too, if you'd like a paper copy, ADR/eMAIL will provide you with it.

And with ADR/eMAIL, electronics are only half the story. Economics are the other half.

ADR/eMAIL reduces paperwork and paper flow, reduces administrative time and costs, reduces telephone expenses, reduces mail and telex expenses and reduces training expenses because its simple, user-friendly end-user interface requires no data processing experience and little training.

Best of all, ADR/eMAIL is software you can have without spending a penny on hardware. You probably have everything you already need; an IBM (or plug compatible) mainframe, CRTs, 328X printers, PCs, TTY dial-ups and TP networks.

In short, you've already paid most of the price for total office automation. So why not start taking advantage of it.

With ADR/eMAIL.

FORUM

By Andria Rossi

An integrated office system must extend beyond just the integration of functions to the file manager and the operating system. The success of a hardware design should also be measured by its ability to support various operating systems and to process different file structures through its file manager. The ideal product will support integration on three levels: application, file and operating system. Today, however, most developments are at the application level only.

Application Integration. Integration at the application level can best be described as integrated packages available on personal computers. One example of these packages is Lotus Development Corp.'s 1-2-3. Different functions are closely coupled to ensure interactive relationships among the various applications.

The next step, which only a few vendors have mastered, is to include data transfers from one application to another. It is not sufficient just to copy data into another application and data transfers should not be restricted to similar kinds of hardware. Rather, all types of systems should participate in data transfers and be executed within an interrupt mode. The integrity of the data file should also stay intact following the transfer.

For vendors, the most difficult task will be to develop a common user interface across all applications. Vendors that have developed programs to run under specific hardware have succeeded in these developments, but the industry is evolving into integrating third-party software programs into the turnkey office applications. Unless the vendor is willing to add a superficial layer on top of these applications, one cannot assume third-party software will use similar command structures just because it can be accessed from within that vendor's integrated software offering.

File Integration. The complexity of a file system will depend on the operating system it is built upon and, in some cases, on the underlying data base management system. The file system also directly affects the flexibility users have within applications. If it can support compound documents or if different application files can be stored in a single file element (folder or drawer), then the process of simultaneously transferring and manipulating multiple application files is simplified.

For the vendor designing it, this type of file system is the result of very complex program routines. Even so, a few vendors are on the right track. Generally, these vendors support one file manager for every system in their product line.

Those that have not insisted on a consistent file system are realizing that utilities and/or conversion programs must be written for each file structure that will be part of their integrated system plans. For the end user, this will in most cases translate into more operator keystrokes. The end user will also sacrifice flexibility by not being able to access one common file directory or by not having access to a directory that may not be in his file manager. This defeats the power of an integrated system; at the crux of file services should be a facility to instantly access or retrieve data from the file directory. A directory should be able to be accessed from within any type of application or any screen form. The file system should support a facility that would allow interrupting one application to enter into another, then returning to the original location in the working file. Without a consistent file manager, these operations are cumbersome — in most cases, not even implemented.

Operating System Integration. Until networking different systems together became the "in thing," operating systems were hardly discussed as issues in office systems analyses. Now, with the need to have consistent, portable and even nonrestrictive operating systems, the operating system's influence on the user interface is being acknowledged. Because all applications are developed to run on top of it, the operating system becomes the foundation of the command sequences needed to run these applications.

Most vendors protect the user from having to cope with the "programmer's language" by putting a mask over the operating system. This mask can take the form of menus, fill-in-the-blank screens and even user-friendlier commands. Many WP and DP vendors have succeeded in implementing this disguise, but personal computer vendors have not.

When a vendor decides to design an integrated office system by linking together its existing products, the underlying operating systems play a major role in the user interface. If one consistent operating system is employed, the user is hardly aware of the operating system processes.

If, however, an integrated office system consists of multiple operating systems, either the vendor must develop translations and utilities for each operating system on the network or the user becomes explicitly involved in instructing the system about how he wants to interact with the other operating systems. Another counterproductive issue surfaces when one operating system is upgraded with a new software revision. How will the other operating system applications interact with the revisions? What must be done to allow this interaction?

One of the most important operating system concerns is how multiple operating systems will coexist in a networked architec-

Q&A

Ericsson, Inc., a subsidiary of the Sweden-based telecommunications and information systems manufacturer L.M. Ericsson, recently cosponsored a conference on ergonomics in seven cities in the U.S. and Europe. The company, which is highly involved in European ergonomics, is entering the U.S. intending to take a 5% to 7% share of the U.S. PBX market over the next three years. Hakan Ledin, Ericsson, Inc.'s president and chairman, talked with Computerworld OA *about his company's entry into the market here and about the contributions ergonomics can make in the U.S. office.*

What advantages can Ericsson offer in the U.S. market?

Ergonomics — it has differentiated us in Europe and contributed very much to our success there, and I think the same can be true here. I know, most people in this country tell me nobody knows what ergonomics is and people are not prepared to pay for it.

My answer is, first, it is true — people here don't know what ergonomics is; nevertheless, they deal with ergonomic issues every day. Second, people do not have to pay for ergonomics. If you ask the right questions when a product is being designed, you design it correctly from the beginning. In most cases, the buyer won't have to pay anything for good ergonomics — it is an extra benefit.

What can ergonomics contribute in the U.S. office?

A good definition of ergonomics is that it is quality, productivity and human satisfaction. If I add that together and ask a businessman what it represents, he will answer that it represents profitability. OK, another name for that combination is ergonomics!

More and more of the organisation's cost is now related to the information family, and management is becoming more aware of this. Traditionally, you could look at the DP department and see if it was productive. Now, a rapidly increasing portion of the total cost for information handling is at the end user's desk — not just the cost of the equipment on that desk, but also the cost of the time people spend at the workstation.

Are you in favor of legislating ergonomics?

Legislating ergonomics doesn't serve anybody's purpose. Legislation is always perceived as something that costs money. The businessman says, "Here comes more legislation; that means I have to pay for it." You can explain to people what these concerns are and that many of the solutions are available for free.

Do you believe education is an effective way to reach these goals in the U.S.?

Well, we are trying to educate people through this conference. We sent out a special invitation to chief executive officers of about 1,200 companies — not inviting the CEO personally, but telling him that the conference was coming up and, if the CEO was interested, asking him who in his organization we should address on these matters.

More than 80% of the CEOs responded. That's not only very interesting, it also shows something important: On the bottom of the organization, there is an absolute awareness of the need for ergonomics — the people sitting there working all day are aware of it. But now top management is also becoming aware; they are finding out that information technology means more than just a computer center. To many companies, the application of the information technology is becoming a strategic issue, not a cost-cutting issue.

The link that is missing is the middle manager, the link between the top and the bottom.

Do you think the middle manager is seeing the problem, but for some reason is not communicating it?

That's right. They don't know if they dare to mention these concerns. They don't know if top management will oppose their suggestions because perhaps finding solutions will cost a lot of money. If people can come to understand that ergonomics is nothing but common sense, it would really be to everybody's benefit.

What segment of the U.S. market is Ericsson targeting?

We are basing our entry into the market on our communications systems, and we are looking at two major market areas. In the first, the PBX market, we are offering our MD 110 voice and data PBX product. We believe the PBX will tie the office together as the means of horizontal communication. Local-area networks can offer high speed and high capacity, but how many in the office really need that speed?

The other area is the central office, where we want to take advantage of AT&T's divestiture. We are developing our AXE [digital central office switching] system so we can offer it to the Bell Operating Cos. We are also exploring our opportunities in the workstation market.

IBM recently announced it would acquire Rolm Corp. Will this affect your plans?

This move did not come as a major surprise to us. IBM already existed as a presence in the market because of the minority interest it owned in Rolm, of course.

If anything, IBM's move lets us know we are moving in the right direction by pursuing the PBX market. OA

OA NEWS

DEMISE OF DISPLAYWRITER?

Though IBM says otherwise, industry analysts and IBM customers are convinced the Displaywriter is dead. The dirges began when interest in the IBM Personal Computer as an office workstation soared, and analysts now feel Displaywriter's demise is simply a matter of time — the time it takes IBM to introduce a new keyboard for the PC.

In its relatively short lifespan, the Displaywriter has fallen from grace rather quickly. The product was introduced amid the stand-alone stampede in 1980-81 and was an immediate hit. Tom Willmott, director of user programs for the International Data Corp., estimated that as many as 200,000 Displaywriters were shipped in its first 18 months on the market. Unfortunately for Displaywriter, the IBM PC, introduced in 1981, was enjoying even greater popularity. As the PC began to dominate the Fortune 500 market, IBM began to focus attention on that product to the detriment of Displaywriter.

IBM customers and industry consultants began to sense a change in focus earlier this year when Big Blue started quoting 11-month delays on shipments of Displaywriters. According to one customer, orders used to be filled within three weeks. Though he had installed more than 200 of the workstations in 1982 and 83, this customer added just 11 this year. "The Displaywriter is dead here," he said.

"The impression I have is that the PC running Displaywrite software is the replacement for Displaywriter," said Patty Seybold of the Seybold Consulting Group in Boston. "It won't be too long before software for the PC is equivalent to the functionality of Displaywriter, and then the only remaining missing piece will be a new keyboard."

According to Willmott, the Displaywriter costs too much money and is not compatible with IBM's workstation strategy. "There's no reason to have two boxes doing the same thing . . . one costing $14,000 and the other $5,000. People will no longer buy that. Even the sucker-born-every-minute routine will run dry in 1985," he said.

IBM is still "talking up" Displaywriter until the new keyboard is ready, Willmott added. "They have been quoted as saying they want an 'orderly transition' to the new keyboard," he explained. "I believe they are waiting for inventories on the Displaywriter to get lower and they want to avoid another 'Chiclets' fiasco like they had with PC Jr. They want the dust to settle on keyboard design in the industry."

Of course, only IBM knows for sure what its plans are for its products. A company spokesperson pointed out that IBM is committed to both the Displaywriter and the PC functioning in the marketplace. "Customers will continue to want high-function, stand-alone word processing," the spokesperson said. "They will also want to move away from dedicated word processors to more intelligent workstations, so we see a need for both." There are no plans, she said, to do away with the product.

Stay tuned.

OA GROWS IN MIS

Office automation expenditures within the management information systems (MIS) budget increased nearly 50% over the past year, reflecting both the steady growth of OA and increasing consolidation with MIS. This was among the key findings of the Diebold Group's 1984 Biannual MIS Budget Survey.

According to David Dell, director of research services for Diebold, OA still remains a very small percentage — between 1.5% and 2% — of the MIS budget in major corporations. Despite those numbers, Dell is convinced that they point to a trend.

"We're not talking about huge dollar increases, but there is a significant share of new moneys that go into the MIS budget being diverted specifically to office automation," Dell explained. The figures also reflect a better accounting and control of expenditures as well as increased MIS responsibility in the OA area, he added.

The survey also found that 80% of respondents have information centers, up from 67% in 1983. This reflects what Dell called a growing commitment to end users from within MIS. Off budget expenses are growing in the continued turning over of responsibility and expenses to end users, he said.

According to the survey — which included 150 companies with MIS budgets of approximately $30 million to $40 million — MIS budgets have increased only modestly in comparison with the sharp increases in work load most companies are demanding from their information resources. This has forced MIS management in these companies to reallocate resources and shift more work and responsibility to the users of computer services and equipment within the corporation.

"The real problems of growth and managing and having something to manage are just beginning," Dell stated. "It's like saying the most exciting part of a

BRIEFS

NEW YORK — Europe may be learning the wrong lessons from U.S. high-tech companies, according to John Diebold of The Diebold Group, Inc.

In a speech he gave recently in Frankfurt, Diebold warned that Europeans expect too much from venture capital, especially in a European environment where risk-taking is discouraged and failure is not tolerated. He also warned that too much emphasis is being put on European high technology and said that only 1.5% of new U.S. businesses each year are high tech. For more information, contact The Diebold Group, Inc., 475 Park Ave. South, New York, N.Y. 10016.

WELLESLEY, Mass. — The demand for integrated software on personal computers will skyrocket from 445,000 packages in 1983 to more than 3.6 million in 1988, according to a report by Venture Development Corp. (VDC).

"Integrated Software for Personal Computers 1983-1988," said that about half of the packages are currently sold at computer stores and that standard distribution channels will be severely tested in the future.

The report is available for $2,650 from VDC, One Washington St., Wellesley, Mass. 02181.

DELRAN, N.J. — NBI, Inc.'s word processing systems swept the top three positions of Datapro Research Corp.'s 1984 Honor Roll of Word Processing Systems.

The other vendors selected after a survey of 3,400 WP users were CPT Corp., Compucorp and Exxon Corp. NBI was the only vendor selected in both stand-alone and multiterminal categories.

The 25-page report, "User Ratings of Word Processing Systems," costs $29 from Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

PORTOLA VALLEY, Calif. — U.S. expenditures on expert systems will grow to $2.2 billion by 1990, according to a report from International Planning Information (IPI). The 380-page report, "The Commercial Application of Expert System Technology," said that while Digital Equipment Corp. computers are currently the most widely used, the market for workstations and software "shells" for expert system development is expanding. The report costs $395 from IPI, 164 Pecora Way, Portola Valley, Calif. 94025.

WELLESLEY, Mass. — There are more than 3,000 software packages for the IBM Personal Computer and IBM compatibles, according to a report by Venture Development Corp. (VDC) that describes each of them.

The study, "IBM PC Software: Directory and Analysis," said that 26% of the titles fall in the general business category and 18% are designed for specific vertical markets. The $795 report is available from VDC, One Washington St., Wellesley, Mass. 02181.

PORTOLA VALLEY, Calif. — The number of personal computers shipped to European end users will skyrocket 57% in 1984, according to a report by International Planning Information (IPI).

The 275-page report pointed out that the installed base of micros in Europe is expected to reach 11 million by 1990. IBM's share in this market reached 27% in 1984. The report, "The European Personal Computer Market 1984-1990," is available for $970 from IPI, 164 Pecora Way, Portola Valley, Calif. 94025.

YORKTOWN HEIGHTS, N.Y. — IBM research scientists have produced an experimental system that can correctly recognize 5,000 spoken words from a standard business vocabulary, the company reported.

The system, which requires a user to train it by reading a brief standard text, is reportedly correct 95% of the time. For more information, contact IBM Research Division, P.O. Box 218, Yorktown Heights, N.Y. 10598.

FRAMINGHAM, Mass. — More than 83% of minicomputer and mainframe users choose DP manufacturers for their service contracts, according to a report from International Data Corp. (IDC).

Hewlett-Packard Co. and Digital Equipment Corp. lead the rest of the vendors, according to users surveyed by IDC. The report, "User Satisfaction with Customer Service: Minis and Mainframes," said third-party maintenance firms account for only 5% of the service market. It is available for $2,400 from IDC, 5 Speen St., Framingham, Mass. 01701.

NORWALK, Conn. — One of the greatest fears of DP and corporate security department heads is deliberate harmful acts by disgruntled employees, according to a report by International Resource Development, Inc. (IRD).

Employee revenge, made easy by an accessible microcomputer, was ranked the second greatest fear, following accidental mishaps by workers. The 220-page report, "Computer Security — Hardware, Software, Systems and Facilities Markets," costs $1,850 from IRD, 6 Prowitt St., Norwalk, Conn. [illegible]

FINALLY. HELP FOR THE DATA CRAZED.

Introducing Cypress,® Cedar,™ and Juniper.™ Three fast, friendly, infinitely applicable desktop ideas from ROLM.

It comes as no surprise that people react to technology differently. Dyed-in-the-chip techies thrive on it. True nonbelievers avoid it instinctively.

Now you can please all of the people all of the time. Honest.

Say goodbye to complicated log-on codes. Just push a button and — whoosh! — travel all the way to a data base, talk to a mini or access your IBM mainframe.

Say hello to speakerphones, phone books, message takers and calculators. Built right in.

If you want to take snapshots of data in your mainframe, there's Cypress. It's as easy as Point & Shoot. It's a smart little ASCII terminal integrated with a fully-featured digital phone.

Need a 512 KB, fully IBM-compatible PC that runs programs like pfs:graph,™ the IBM Assistant Series,™ 1-2-3,™ and lets you mini-network through your phone line? Cedar's the one.

Already in love with your IBM® PC or XT but crave the affections of Cypress? Ask for Juniper. Its one slot adaptor card lets your system keep growing. And growing.

Of course, only ROLM has Cypress, Cedar and Juniper. Because only ROLM has the system to run them on. At its heart is the CBX II, a breakthrough communications controller that manages voice and data over standard telephone wire. Simply, brilliantly and cost effectively.

And ROLM has the technical edge, the operational track record and the worldwide service and support organization to please even the toughest customer.

So phone ROLM. High tech. Not high anxiety.

ROLM

THE YEAR IN REVIEW AND A LOOK AHEAD

GOODBYE, BIG BROTHER HELLO, BIG BLUE

BY GLENN RIFKIN

or three. It was, they pointed out, a time for users to step back and assess implementation strategies and future needs while taking realistic looks at such issues as networking and communications.

Several industry consultants and analysts discussed with *Computerworld OA* some of the major events of 1984 and looked ahead to 1985. Here is what grabbed their attention:

IBM in the Office: The year started slowly for IBM, but by midsummer Big Blue picked up the pace. As one analyst said, "Everything from July on has been one IBM move after another. The pressure just isn't slowing down."

In the spring, IBM shocked the computer industry by announcing a delay of two to three years on its token ring local-area network offering. Though the delay was startling, the statement of direction "made the local-area network market legitimate," according to Melody Johnson, an analyst with Cable, Howse and Ragan in Seattle.

At the same time, IBM offered a cabling configuration and, later, a network from Sytek, Inc. specifically for its personal computers, as an interim network solution. As Ed White, associate director of OA services at Dataquest, Inc. pointed out, user excitement about networks has generally been premature, and "IBM has honestly faced the problem that the user is not ready for networking yet because networking is going to involve integrated voice, text and data."

Despite that, IBM's network announcements and nonannouncements actually stimulated business in that market, according to other analysts.

The IBM PC grew even stronger during 1984 as the de facto standard in the office and IBM increased the pressure on competitors and look-alike vendors by lowering its prices and announcing a glut of software.

The struggling PC Jr. was given a shot in the arm with a new keyboard and additional features, and the long-awaited Popcorn appeared in August in the form of the PC AT. The AT, a powerful, aggressively priced multiuser system, is expected to have a major impact on the desktop market, a market IBM already controls.

Some analysts, however, don't believe the AT is a breakthrough product for office automation. "I was more fascinated that they could put 1.2M bytes on a floppy disk," Tom Willmott, director of user services for the International Data Corp. said, referring to part of the AT's offering. "The fact that they were going to incorporate an Intel 286 into a new high-end product was no surprise, and I haven't seen anything new or innovative in the architecture."

"I question whether or not the AT could be considered an OA device," White added.

However it eventually fits into IBM's office plans, the AT was simply another example of IBM aggressively flexing its muscle. In late September, the company announced its plans to acquire Rolm Corp., a leading PBX manufacturer which it had purchased a percentage of last year.

IBM reportedly wasn't happy with the pace of development on the integrated voice products Rolm had undertaken. According to Randy Goldfield, president of the Omni Group in New York, the Rolm announcement was the last piece IBM needed in order to compete with AT&T in the PBX arena.

Whatever the true reason for the takeover, consultants agreed it underscored the importance of having a powerful voice-switching PBX network capability in order to compete for the office market.

By late October, IBM had moved to secure its position in the office market even further by announcing its office systems family of software incorporating the IBM PC, System 36 and, eventually, System 370.

The announcement was among the key introductions of the year, according to Patty Seybold, editor of the Seybold Report on Office Systems. "This plugs a big hole in IBM's office strategy," she explained. That strategy, according to Seybold, is for a departmental solution which allows PCs to be plugged into a System 36 running Disoss for filing, retrieval, electronic mail and electronic document distribution.

By designating the System 36 as the host system for its office solutions, IBM has essentially pulled the rug out from under both its 8100 and 5520 systems, consultants said. By further extending support of Displaywrite software for the PC and for System 36, the company has also sounded a death knell for the Displaywriter.

As 1985 gets under way, the military cliches are being dusted off. Goldfield said that the industry is now reduced to being IBM versus AT&T watchers. Willmott expects to see "an enormous battle between IBM and Wang for the desktop in the office." IBM is coming at it from the DP side: Wang is already positioned in the office, but without a strong DP background. "Their continued penetration of this market will rest on their success in establishing themselves as the vendor of choice with MIS planning people. Those issues will come to a head in 1985, but the groundwork has been laid this year," Willmott said.

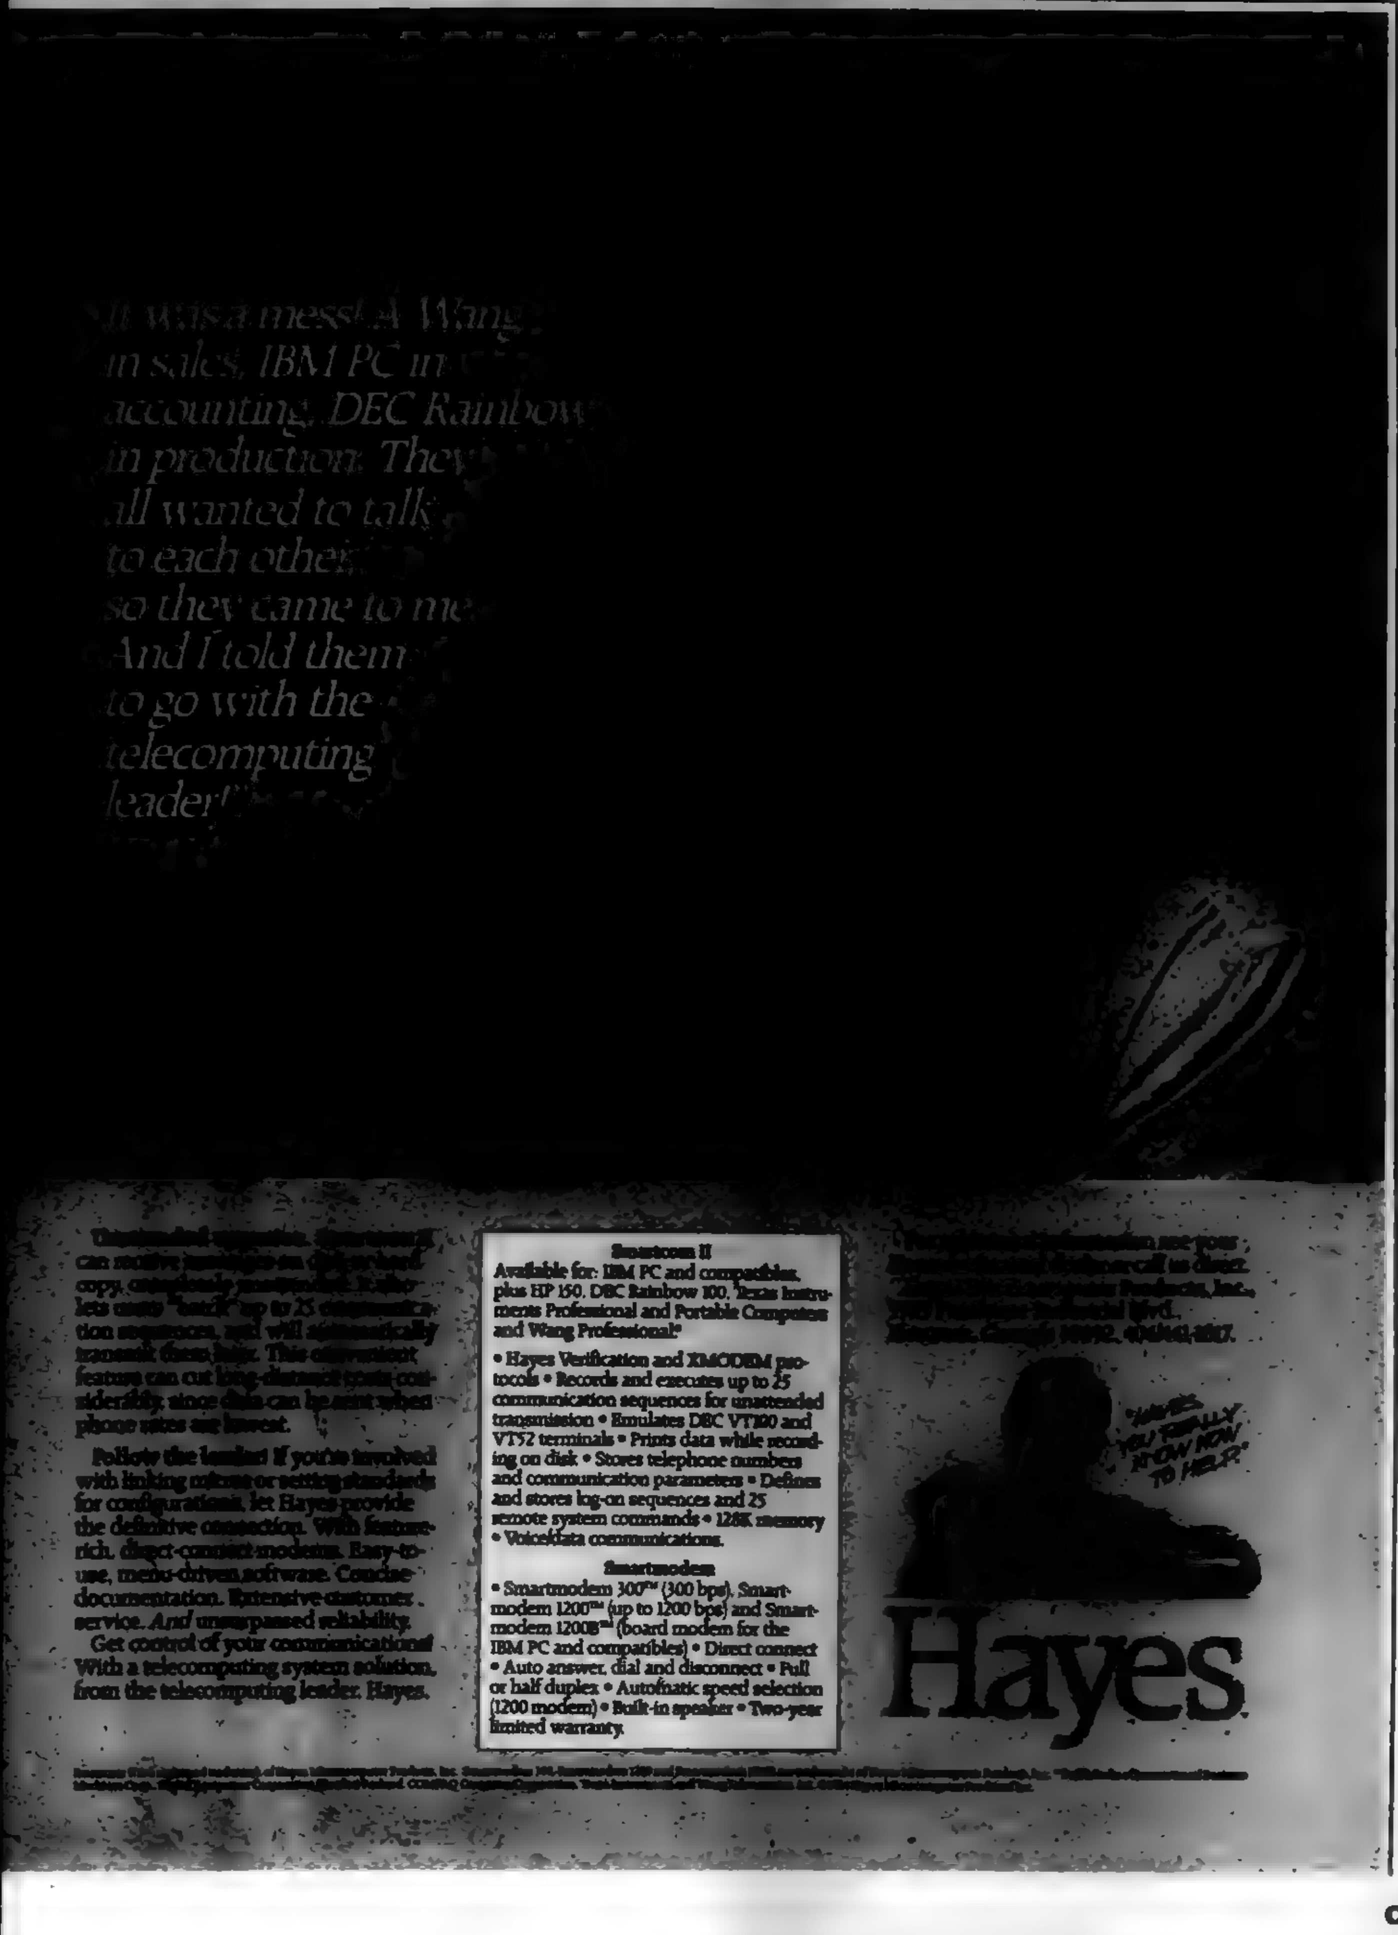
IBM, of course, is setting a fast pace and it has started raising some eyebrows. One consultant, awaiting the November election results said, "They do want it all, but there's a certain point within a couple of percentage points, where their legal department says 'Hey guys, lighten up on market share.' [They believe that] as long as Reagan is reelected, there won't be any problems, but why push their luck?"

By extending support of Displaywrite software to the PC and the System 36, IBM has sounded a death knell for the Displaywriter.

Apple Computer, Inc.'s Macintosh: Seybold called the introduction of the Macintosh "the number-one happening for this year." Setting "a whole new standard" for user interfaces, the Mac served two purposes, according to Seybold. First, it let end users know there is now an easy, nonthreatening way they can use computers; second, it served notice to IBM and the rest of the industry that "this is the interface standard you must meet."

"It attracted a bunch of new users in the office — not because it was an office machine, but because of the interface," Seybold said. "The IBM PC Jr. announcement was a complete catastrophe," Willmott added, "and therefore the Mac appealed to people in large corporations that were unwilling to spend $5,000 per workstation."

Analysts agreed that, after its splashy introduction, the Mac ran into serious problems because of the lack of adequate software for the business environment — data base and spreadsheet packages, for example. "That has hurt the Mac in the OA environment," Willmott said. "However, its original introduction and appeal to office planners



It was a mess! A Wang in sales, IBM PC in accounting, DEC Rainbows in production. They all wanted to talk to each other so they came to me. And I told them to go with the telecomputing leader!"

Unattended operation. [illegible] can receive messages on disk [illegible] copy, [illegible]. It also lets users "batch" up to 25 communication sequences, and will automatically transmit them later. This convenient feature can cut long-distance costs considerably, since data can be sent when phone rates are lowest.

Follow the leader! If you're involved with linking micros or setting standards for configurations, let Hayes provide the definitive connection. With feature-rich, direct-connect modems. Easy-to-use, menu-driven software. Concise documentation. Extensive customer service. *And* unsurpassed reliability.

Get control of your communications! With a telecomputing system solution, from the telecomputing leader. Hayes.

Smartcom II
Available for: IBM PC and compatibles, plus HP 150, DEC Rainbow 100, Texas Instruments Professional and Portable Computers and Wang Professional.*

• Hayes Verification and XMODEM protocols • Records and executes up to 25 communication sequences for unattended transmission • Emulates DEC VT100 and VT52 terminals • Prints data while recording on disk • Stores telephone numbers and communication parameters • Defines and stores log-on sequences and 25 remote system commands • 128K memory • Voice/data communications.

Smartmodem
• Smartmodem 300™ (300 bps), Smartmodem 1200™ (up to 1200 bps) and Smartmodem 1200B™ (board modem for the IBM PC and compatibles) • Direct connect • Auto answer, dial and disconnect • Full or half duplex • Automatic speed selection (1200 modem) • Built-in speaker • Two-year limited warranty.

[illegible] Products, Inc., [illegible] Blvd., [illegible] 404/441-1617.

Hayes

[illegible]

was an interesting surprise in 1984. The jury is still out on its final acceptance."

Seybold pointed out that the Mac sold well in its first year because it was a novelty and that in its original configuration, it simply was not an office machine. In fact, the stepped-up introduction of the 512K-byte "Fat Mac" was Apple's reaction to that, she said. "They knew from corporate customers that they had to have a more powerful machine quickly if it was to be taken as anything more than a toy." In November, Apple undertook a multimillion-dollar advertising campaign to bolster sales in the office market.

In 1985, Seybold expects Apple to concentrate on connecting and networking Macs through such products as Apple Bus. She is concerned that Apple is underestimating the amount of work it needs to do in order to connect Macs to other systems. "At this point, all they are saying is that if you want your Mac to talk to a Wang system, buy the source code from us and modify it. No user wants to do that. Apple is going to have to learn a few lessons, but they probably have time," she added.

Wang Laboratories, Inc.'s Office Assistant: Though it wasn't met with a great deal of fanfare, Wang's Office Assistant is considered a key office product for 1984. At $2,395, the multitasking desktop unit is aimed specifically at the secretarial marketplace, an audience that has been swept aside in the rush to automate the professional desktop.

Positioned in between an electronic typewriter and a personal computer, the Office Assistant "addresses the real issues of the secretary," according to Dataquest's White. "It's not a perfect product, but it has combined the necessities of word processing and the electronic typewriter in a single device that also allows for the expansion potential of communications, networking and limited PC applications," he stated.

Not everyone is convinced that Wang was simply identifying an overlooked market. Johnson pointed out that, like other office vendors, Wang is losing money on its personal computers. At Wang, the problems at the low end were starting to hurt earnings; as a result, the company decided against bringing out just another low-cost PC, she said. Instead, they chose to try to differentiate the market.

Analysts agreed 1985 will be a critical year for Wang. Its proprietary office systems software, Wang Office, is now shipping, and customers can decide whether it is prudent to stick with the vendor or to look elsewhere. Elsewhere may just be IBM, which applied a tightening hand to the neck of Wang with its System 36 announcements in October. By offering software that runs across several different office product lines, IBM effectively negates what had long been a Wang advantage.

AT&T Jumps In: In 1984, Americans added the word divestiture to their vocabularies and AT&T took its first tentative steps into the office market. As Seybold indicated, the significance of AT&T's first year in the market "was how badly it did." The company may have done well enough financially and solidified its PBX market, but it did nothing in office systems, she said.

In fact, AT&T did announce its 3B line of minis and supermicros in March and later unveiled an MS-DOS-based personal computer (designed by Ing. C. Olivetti & Co. in Italy). In addition, it stepped up its support of Unix as a de facto standard operating system. All that, however, was not enough.

> ***"No one knows how to [network the workstation], no one knows why they should do it and no one knows how to cost-justify it. If you wind up having a workstation on everyone's desk, but have no network, aren't you missing out on the whole point?"***
>
> **Randy Goldfield, Omni Group**

"They don't have any software," Seybold explained. "They devoted so much time to reorganizing, which was one of the problems and, frankly, they underestimated how much time it takes to create office application software."

In fairness, consultants agreed that AT&T simply needs more time. "They've got a chance to shine when we really get into integrated voice, text and data," said White. "You'll see progress in '85 but more likely in the '85 to '87 timeframe."

Market Trends: With IBM surging, consultants have become cautious about predicting survivors in the office market. In the personal computer battle, IBM has helped kick off the anticipated shakeout, and 1984 was a year of diminished returns for many start-ups. Gavilan Computer Corp., Victor Technologies, Inc., Otrona Advanced Systems, Inc., Eagle Computer Inc. and others either filed for bankruptcy or were on the brink.

In the office market, despite IBM's movements or perhaps because of them, some analysts are predicting a backlash against Big Blue. According to Goldfield, the maturing of the marketplace is making a difference. "In an immature marketplace, people choose IBM because no one ever got fired for picking IBM," she explained. "As the market matures, there are more viable alternatives that emerge."

"Every time IBM makes an announcement it attracts users while at the same time, it tells many that it's not the way to go," Seybold added.

Consultants agreed that Wang would continue to be IBM's strongest competitor in the office, but that both Digital Equipment Corp., bolstered by an internal reorganization, and Data General Corp., with its well-regarded DG/One portable, are becoming major factors as well. According to Johnson, some companies — Xerox Corp., Honeywell, Inc. and Exxon Office Systems, Inc., for example — will have to find niches and vertical markets to survive while others, such as CPT Corp., NBI, Inc. and Syntrex, face uncertain futures.

A surprise for '85 may be Datapoint Corp. which, according to Willmott, has hit bottom and is ready for a comeback with some innovative new products. "I look for Datapoint to make a bold turnaround in 1985," he said.

Other Major Issues: Perhaps the most important issue to emerge in the office this year was the question of networking. Despite White's feeling that users aren't ready for it, networking personal computers and office systems was high on the list of priorities for OA implementors, according to consultants. Goldfield's Omni Group conducted an extensive study involving more than 800 Fortune 500 decision makers and, according to the study, networking the workstation is the single greatest concern.

"No one knows how to to do it, no one knows why they should do it and no one knows how to cost-justify it. If you wind up having a workstation on everyone's desk but no network, aren't you missing out on the whole point?" asked Goldfield.

In that regard, the groundwork has been laid for further controversy in 1985 over IBM's DIA-DCA and the issues of exchanging and formatting the text, graphics and voice capabilities over multiple vendor equipment, according to Willmott. "These are very important issues for office planners when a large corporation wishes to have distribution networks that make sense across the total company," he said. "It's at the point where the giants like DEC, Wang and DG have completed their strategic planning for these issues, but we've yet to see the products or results of the research and development. That's likely to occur in 1985."

Though analysts agreed there were few major software announcements (beyond IBM's System 36) in 1984, Dean Hiller of D.L. Hiller & Assoc. in Sterling Heights, Mich., felt that the first truly integrated software packages, in the form of Ashton-Tate's Framework and Lotus Development Corp.'s Symphony, were shipped. Hiller also pointed out that the acceptance of these kinds of packages by "power users" in corporations was a major trend during the year.

"You tend to spend a dollar on training for every $3 you spend on the system," said Hiller. "Therefore, it makes sense to train somebody on a product that has a consistent command interface. Integrated software and products with the same command syntax are products you should train the masses on."

Seybold predicted that 1985 would be the year of networking and multiuser software as well as applications generation software. "That's going to be the next wave after spreadsheets," she said. Seybold also predicted a solidification of offerings in the telephony arena, including the integration of telephony functions into office systems.

In the Emperor's New Clothes department, Unix was among the hottest topics of 1984. But the Bell Labs innovative operating system was more sizzle than steak, particularly in the office market, according to consultants. "Unix in '84 did not change the way people use computers and do data processing in commercial installations," Willmott said. "Unix is going to continue to be an issue next year and then it will become a nonissue the year after," Seybold added.

Seybold pointed out that despite the fact that people assume Unix is a requirement for minicomputers and for networking personal computers, the vote is still not in. "Either MS-DOS will migrate close enough to Unix, or Unix will be improved so that it's better for networking or there will be a third kind of hybrid operating system that will crop up as a replacement. I don't see Unix as it currently exists surviving as a major factor over the next two or three years," she stated.

The State of OA: In 1984, there was a sense that the term office automation had outlived its usefulness. There was also the very real feeling that despite years of discussion, very little had actually changed in the way people work in the office.

According to Ed White, the complex picture of integrated office systems continues to baffle management and, in order for true office automation to be implemented, the office faces an almost total reorganization in terms of work flow and the way people think about their jobs. "There needs to be a lot of training and a lot of systems design, and it will be a good 10 years before it all happens," White said. **OA**

GLENN RIFKIN

EUGENE MANNO, HONEYWELL'S ASSOCIATE GROUP VICE-PRESIDENT FOR SMALL COMPUTER AND OFFICE SYSTEMS, AT THE MICROSYSTEM NX.

HIGH HOPES AT HONEYWELL

BY GLENN RIFKIN

In 1985, Honeywell, Inc. will celebrate its 100th birthday. The $6 billion Minneapolis-based giant hopes to get its 94,000 employees in the party mood by creating an up-scale national celebration of its centennial. In the office automation community the noisy party will probably be met with great surprise — instead of a birthday, the industry was more likely expecting a wake.

Though Honeywell's other businesses (aerospace and defense, control products and systems, communications and so on) may all have reason to celebrate, the company's computer business — Honeywell Informations Systems — has run into hard times and a Big Blue wall. Most hard hit has been the office systems division, which virtually disappeared from sight for nearly two years. The division is now making a comeback attempt with a reorganization, reported autonomy, a new leader, a spate of new products and a new strategy for penetrating the OA market.

Industry analysts are divided on Honeywell's chances for success. Some, like Tom Billadeau, vice-president of the Gartner Group in Stamford, Conn., have written off Honeywell completely. "They have done basically nothing that makes any sense at all in the office automation business to date," Billadeau stated. Others are taking a wait-and-see stance, believing that the company has at the very least set its sights on more realistic goals and has the presence via its large systems to make a go of it.

What Honeywell intends to do, in fact, is forego the broad-based general OA market and concentrate on large but specific vertical markets with tools designed especially for those markets. It also wants to look to its installed base of large computers and serve as a systems integrator for that base in the office. According to Chuck Ross, director of market segment operations, "That is our history. We got into the business as a systems integrator. The others are iron pumpers; they got into the business that way."

For Honeywell, the task at hand will be difficult and multifaceted. The company is still fending off questions about its inability to move swiftly and innovatively in the rapid-paced end-user market. Some analysts, in fact, have pointed out that several of the new products are merely revamped versions of previous failures. In a business driven by marketing and hype, Honeywell has earned a reputation as boring and slow. It is also not out from under the shadow of the massive layoffs and cutbacks that racked Honeywell Information Systems two years ago. Questions about internal morale and corporate commitment to OA still abound.

Although the industry may still be unsure, internally things have been straightened out, according to James J. Renier, vice-chairman of Honeywell and president of Honeywell Information Systems. "It is correct to say that in the past in the office automation area, we did not do a good, quality job. That's prior to 1982. Our products didn't have the requisite quality. They have it now and that period is behind us.

"Sometimes an organization has problems and people get discouraged," Renier said. "A conclusion is drawn that we are not interested any more, and that's a natural kind of assumption. But we have never lost our enthusiasm for the market and we have never backed off in our support of the effort."

During the next year, Honeywell intends to get its message out to the buying public via a stepped-up national advertising and public relations campaign designed to highlight its new strategy and products. Though it has taken Information Systems nearly two years to reorganize and straighten out its internal affairs, company officials are confident the window of opportunity has not closed. "These are huge markets," Renier insisted. "There is still room for many companies to do their thing."

Among the changes was the recent naming of Eugene Manno to the new position of associate group vice-president for small computer and office systems. Manno had served as vice-president and general manager of Office Management Systems and now assumes control of the entire OA push for Honeywell.

According to Manno, the change is a significant one. With its 25,000 employees and wide-ranging line of computers, Information Systems had been a monolithic structure without an identity, he said. It was simply one huge division reporting to Minneapolis. Now, all marketing and pricing, profit and loss and strategic decisions concerning OA rest with Manno in the division's Billerica, Mass., office.

Manno, admitting impatience on his part, explained that the process took so long because "changing an organization and its thought processes and culture that have been deeply engrained over a 25-year period can only be accomplished at the assimilation rate of the people."

While coordinating the structural changes, Manno's group also faced the difficult task of new product development and creating a viable new marketing strategy. The company decided to forego the general OA market — hence the vertical market approach.

Though Honeywell, through its mainframe computers, has a wide DP presence, there is serious question as to how much of its installed base is left to target for office systems.

"We project that 50% of its installed base are Wang customers," Billadeau said. "Another 25% have made a different vendor choice. That leaves them just 25% without a commitment."

David Cushing, an analyst with the Omni Group in New York, pointed out that, despite the presence of other vendors in its base, Honeywell still has "a lot of elbow room in terms of pure market volume." "We want a bigger share of smaller markets," Manno stated.

Those vertical markets include administrative sales support — specifically, remote sales locations for large and mid-size corporations; engineering administrative support; and the intelligent building and shared tenant environment (a market that is carefully tied into Honeywell's expertise in the controls arena). The company is also taking a hard look at the health and medical records market.

"It's a good marketing strategy that others will take as well," said Ronni Marshak, associate editor of Seybold Publications. "They are not specializing too much — sales and engineering are large enough markets to be generic. Frankly, it is the only way they can keep going."

To attack those markets, Honeywell has introduced several new products and indicated that more are on the way. For the sales support market, the company unveiled its Office Management System (OMS) 40 and 90. To address the engineering administrative support market, Honeywell introduced its Microsystem NX, a Unix-based multifunction workstation developed by Corvus Systems, Inc.

The OMS 40, available in two models, is based on Honeywell's 16-bit DPS 6/40 minicomputer and runs the proprietary Gcos 6 operating system while supporting up to eight users on Model 2. The OMS 90, based on the 32-bit DPS 6/95 supermini, is available in three models and is packaged for larger offices. It can reportedly support up to 34 workstations on Model 3. Though repackaged and marketed as new offerings, the OMS systems are merely revamped versions of the ill-fated Office Automation System (OAS) software running on the DPS 6, according to the Seybold Report, an industry newsletter.

With an average per workstation cost of $6,495, Honeywell believes it is aggressively attacking the price/performance levels of competitors such as Wang Laboratories, Inc., IBM and Digital Equipment Corp. Though the OMS systems don't currently offer connectibility to IBM PCs, Honeywell indicated that capability would be offered on the next release of the product in late 1985.

At under $10,000, the Microsystem NX is aimed specifically at the engineering support environment. Based on the Motorola, Inc. 68000 processor, the NX comes with 512K bytes of main memory, a detachable keyboard, 12M or 18M bytes of disk storage and a 15-in. monochrome, high-resolution monitor.

According to Martin Strakhovsky, director of workstation marketing, Honeywell has already begun putting NXs on the desks of its own 30,000 engineers. The NX was not designed to compete with advanced computer-aided design and manufacturing systems; instead, it is geared to provide administrative support for engineers when the design work is done.

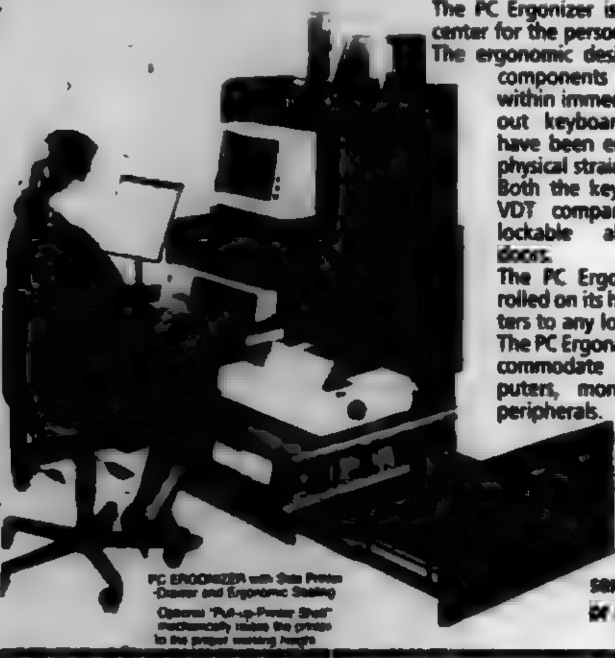
Though Honeywell has centered its office thrust around the DPS 6 minicomputer, it hasn't ignored the low end completely. In 1983, it brought out the IBM PC-compatible Microsystem 6/10 and will soon unveil the Microsystem PC. However, the company seems to be making only a perfunctory gesture toward the low end; both micros are merely OEMed versions of Columbia Data Systems, Inc. products.

"They are pass-through products," Ross admitted. "Our sales people can sell [the 6/10 and PC] to anyone, but we're playing the role of systems integrator and they are aimed at our customer base as added value for a DPS 6 system."

Honeywell has also announced compatibility with several local-area network technologies such as Ethernet, Omninet (from Corvus), Bridge Communications and Hyperchannel. Manno's group is working closely with Honeywell's communications division, but it has also established agreements with such vendors as AT&T, Ericsson Information Systems, Inc. and Northern Telecom, Inc. for PBX technology.

Although offerings such as Omninet solve the short-term networking needs, Manno acknowledged that higher level protocols are necessary. He pointed out that Honeywell offers both its own DSA — an architecture based on the International Standards Organization OSI model — and IBM SNA compatibility. Honeywell, he said, plans to remain committed to IBM de facto standards such as DIA-DCA and plans to use its new OMS line as the gateway to these higher level protocols.

Within the next six months, Honeywell also plans to announce its entry into the image-processing arena. The company is working with the Belgian company



THE NEW PC ERGONIZER,™
EVERYTHING AT YOUR FINGERTIPS,
AT A PRICE WELL WITHIN YOUR REACH.

The PC Ergonizer is the ultimate workcenter for the personal computer.
The ergonomic design puts all systems components and workspace within immediate reach. The pull-out keyboard and workshelves have been engineered to relieve physical strain.
Both the keyboard and optional VDT compartments come with lockable aluminum tambour doors.
The PC Ergonizer can be easily rolled on its heavy duty carpet casters to any location.
The PC Ergonizer is designed to accommodate most personal computers, monitors, printers and peripherals.
All in one attractive, superbly constructed workcenter.

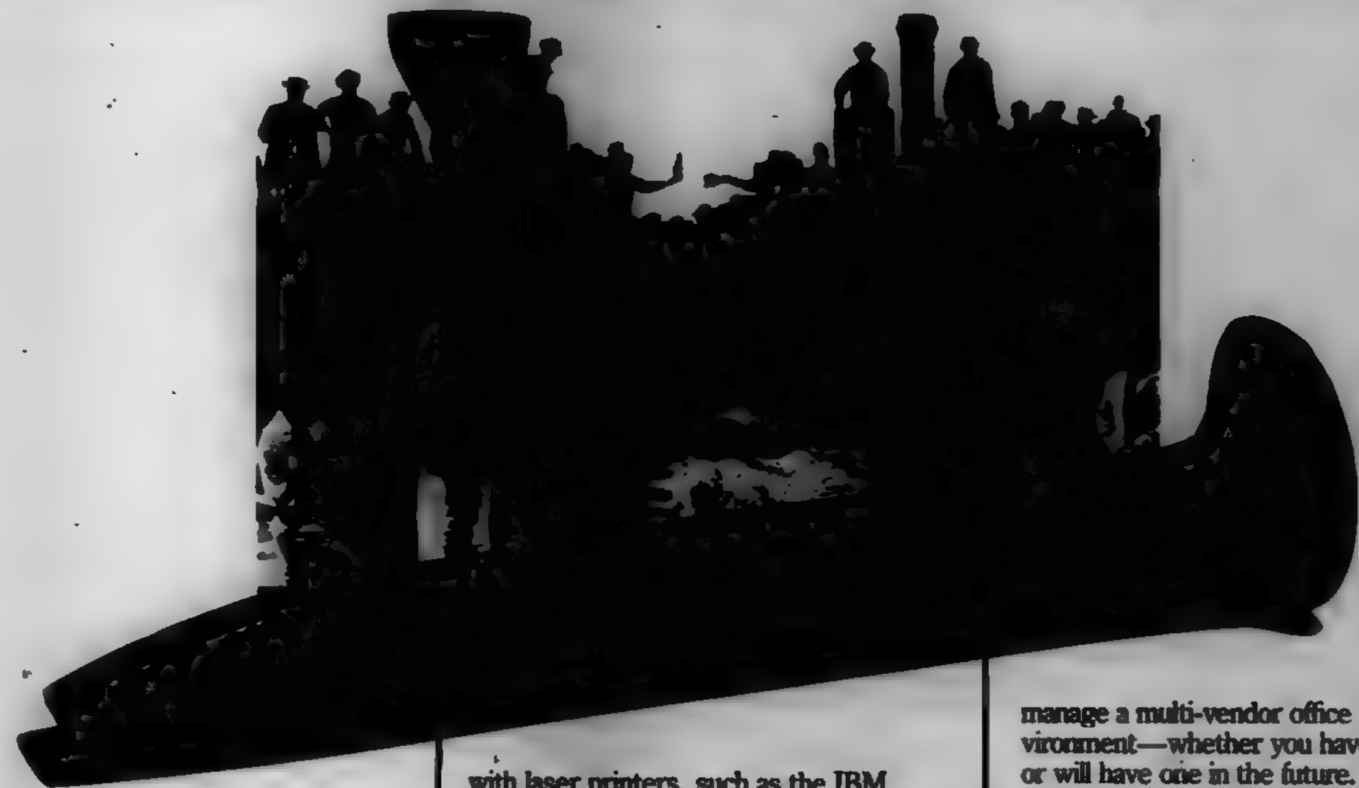
Some connections are more important than others.



Soft-Switch™ spans the office systems communications gap:

The goal is clear enough: connect all your office systems so that documents can be freely interchanged for editing, storage, display, and printing.

But *interchange* requires far more than simply transporting documents. It requires transforming the document coding so that it is ready-to-edit at the receiving station (including word processors, PCs running word processing packages, and mainframe terminals accessing DCF and PROFS.) Soft-Switch provides *true document interchange.*

Soft-Switch fits the best tool to the function.

For several reasons, you probably have office systems equipment from different vendors. You want to interconnect this equipment and integrate it into your IBM mainframe environment. That's no problem with Soft-Switch because it ties together a variety of brands of equipment. Soft-Switch communicates with IBM, Wang, Xerox, and NBI word processors. And with a variety of IBM PC-compatible word processing programs, such as MultiMate and DISPLAYWRITE 2; with host-based systems, such as DCF and PROFS; with laser printers, such as the IBM 6670; and with standard hard-copy printers.

Running as an application program in an MVS or VM environment, Soft-Switch allows users to send documents to other users—document translation is performed automatically. In addition to translation services, Soft-Switch provides comprehensive electronic document distribution services and text library services.

Soft-Switch solves real-world problems.

Let's say an analyst, in Los Angeles on a field assignment, prepares a document on a PC with MultiMate. With a single, simple command, the analyst can specify distribution to a home-office secretary's Wang OIS in New York and to a 6670 laser printer down the hall from the secretary, and also store the document in a host library.

Soft-Switch transports the document from the PC to the IBM host, translates it from MultiMate to Wang's WPS format and the IBM 6670 laser printer OCL format, automatically routes the document to its final destinations, and stores a copy in the library at the mainframe.

Soft-Switch lets you choose your office system's best course.

Soft-Switch is a valuable strategic tool and it is the first (and only) Document Control System to help you effectively manage a multi-vendor office system environment—whether you have one now or will have one in the future.

Soft-Switch is also totally consistent with evolving standards for office systems. In fact, Soft-Switch integrates multi-vendor office environments by first translating a document into IBM's Level 3 DCA (Document Control Architecture), and then into the exact format required by the receiving workstation. Already installed in many FORTUNE 100 companies, Soft-Switch connects word processors, PCs, text management systems, micro/mainframe links, and electronic mail systems to provide organizations with integrated office systems.

The Soft-Switch connection is the practical solution to your office automation needs and your connection to success in the OA world.

Correlative Systems, Inc., which has developed an image-handling system based on the DPS 6. Manno said he is confident that image processing will be a large business for Honeywell. "The big key now is storage; no one has it solved as yet," he added.

The newly announced systems, coupled with Honeywell's wide range of minis and mainframes, gives the company extensive coverage across many potential markets. But analysts are reserving judgment about the new offerings and any guarantee of success in the office. Seybold's Marshak noted, "the new products are standard Honeywell fare — not exciting, but they can do the job. Targeting niche markets is probably a good idea, and when you look at who is stumbling — Xerox, Exxon — Honeywell is a little above them, probably because Honeywell's a little more conservative. I don't see it disappearing very quickly."

"The idea of working with the user to develop a tailored system for a specific need is a good idea, and some will take advantage of it," said Ken Sobel-Feldman of the Gartner Group. "But I don't think they can succeed overall with it. Users generally want vendors to supply the solution and do all the work. Honeywell needs user commitment, and that could be a long time coming."

How much time Honeywell will need is as unclear as how much time it will get. Renier insisted that the company is in the market for the long haul. Because of Honeywell's size, it does not release revenue figures for each division, but the company indicated that Manno's group had sales of more than $450 million in 1983. The unit made money in 1984, but "I will say the numbers have got to be better," Manno said. The new vertical markets have yet to earn a profit, but the strategy is too recent to be effectively judged, a spokesman said.

There is also speculation that fallout from Honeywell's internal troubles continues to take its toll. One former employee pointed out that fiscal security has come simply because Honeywell has made its numbers more reachable. The company has cut back so dramatically in terms of overhead and personnel (more than 3,000 Information Systems employees were laid off two years ago) that it is able to appear lean and profitable. Unfortunately, this cutting back has also meant that Honeywell is losing market share in the computer business. With only 2% of that business to its credit, there is not much room for decline.

With IBM, AT&T, DEC and a host of others clamoring for pieces of its niche markets and its installed base, Honeywell has to offer something different and better.

"We're a systems integrator," Ross said. "We said that two years ago, and it wasn't what people wanted. I have no fear that we're too late in the market; if anything, we were too early," he added. "Our fundamental strategy is not to simply have an account, but to integrate Wang, IBM, Hewlett-Packard, etc. and ourselves into an office information network responding to the requirements of large organizations. Before, the market didn't want that. But it's ready now and demanding it."

> ***The company has cut back so dramatically that it is able to appear lean and profitable. Unfortunately, this cutting back has also meant that Honeywell is losing market share in the computer business.***

"In the industries we choose to be in, we will be far more flexible than our competitors," added Renier. "We'll offer hardware that will compete with the rest, but they'll get more from us in terms of a system solution and customer service."

Internally, morale is reportedly up again. "I expect relative stability," Renier stated. "I would never promise [no more layoffs], however, simply because promises of that nature are irresponsible. I just don't see anything like what happened two years ago. There's a strong spirit here now."

Though the analysts tend to be a bit more cautious than company executives, there is general agreement that Honeywell has a fighting chance.

"Don't bury Honeywell just yet," Marshak said. "We've been waiting for them to get out of the business since 1975, and they're still here." OA

Get better decision-making, more productivity and a very profitable competitive edge. Instantly.

With SMARTSTAR software, everyone in your office can get on the VAX. They can get the facts they need, when they need them. Organize them any way they want them. In seconds. When a decision needs to be made, it can be made *now*. Not days later when the overworked computer staff can finally get you what you asked for.

Everyone from top to bottom works from the same information. And no one has to be a computer expert. With SMARTSTAR, anyone can quickly design on-screen windows that customize the organization of information, easily access and update it, and create complete reports with a few simple keystrokes.

Because non-programmers can now do their own computer work, programmers love it. They can spend their time on more challenging jobs. Their backlogs disappear. And SMARTSTAR helps cut programming time by a 10 to 1 ratio. It works with VAX/Rdb, DEC's new relational database.

SMARTSTAR does so much that productivity soars. So does profitability.

Call Signal Technology, the leading independent developer of VAX software, for a 30-day trial or on-line demo. See how SMARTSTAR can make your whole office shine.

FEELING AT HOME WITH PORTABLES

BY LAWRENCE F. VOGEL

As relatively low-cost portable computers proliferate, a nearly equal number of questions arise about how these machines can best be used to help the work force do their jobs. An assessment of the suitability of portables as workstations raises many of the same issues found with desktop units. (For the purposes of this article, a workstation is any screen/keyboard unit used by a knowledge worker to support that worker's regular duties.)

Portables and desktops target the same users; it's the technology that's different. While they still can be classified in the microcomputer genus, portables have some strikingly dissimilar characteristics. There is also a

You live so

A 3M diskette can make one read/write pass on every track, every hour, every day for 200 years and still be in terrific shape.

Has 3M discovered the floppy fountain of youth?

In a way, yes.

We discovered that if you want to make a floppy that's certified 100% error-free and guaranteed for life, you have to make every last bit of it yourself.

That's why we're the only company that controls every aspect of the manufacturing process.

We make our own magnetic oxides. And the binders that attach them to the dimensionally stable substrate. Which we make ourselves from liquid polyester. Which we make ourselves.

We also test our

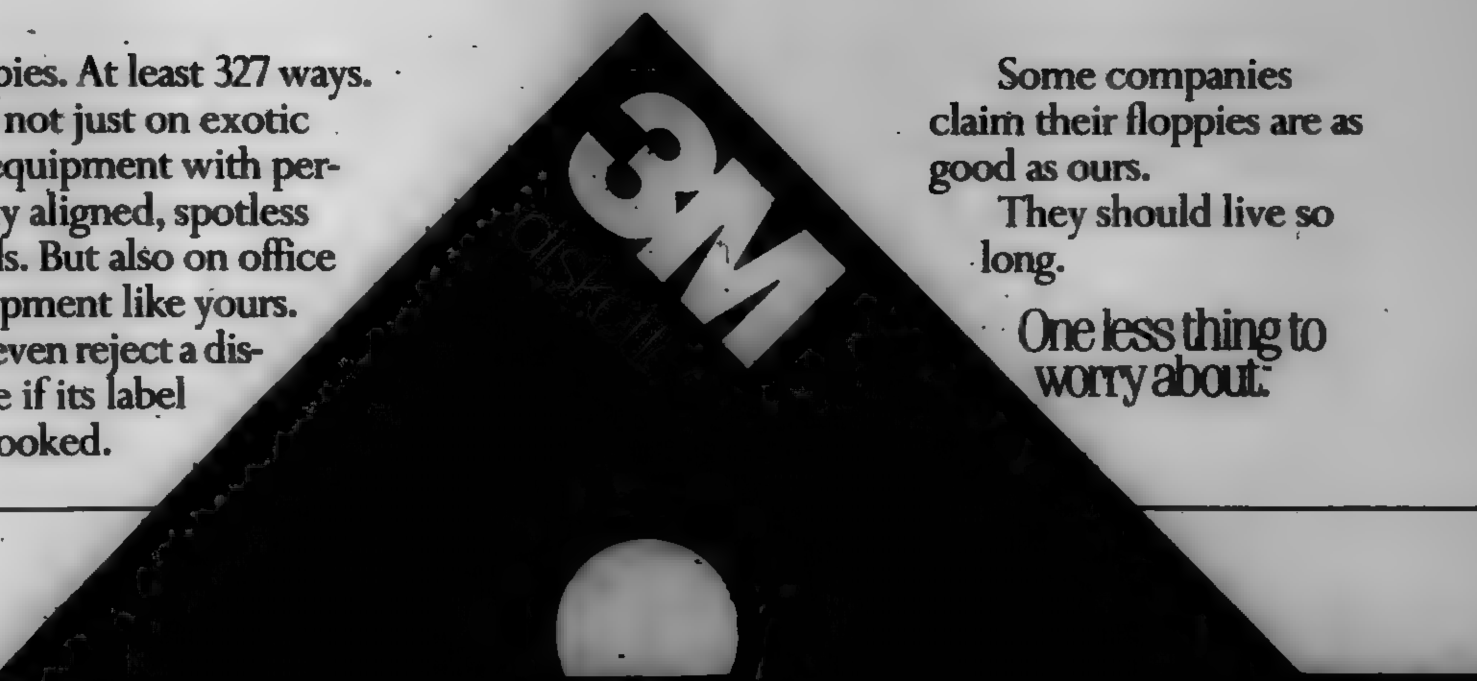
should long.

floppies. At least 327 ways. And not just on exotic lab equipment with perfectly aligned, spotless heads. But also on office equipment like yours. We even reject a diskette if its label is crooked.

Some companies claim their floppies are as good as ours.

They should live so long.

One less thing to worry about.



profound difference in the way many users react to the portable as compared with their response to its desktop counterpart.

Adam Osborne is credited with introducing the first portable model in early 1981. Although Osborne's machine could be carried from place to place, it was not an easy task. It and others that followed in the 20-plus pounds category have come to be known as "transportables" or, to less muscular users, "luggables." Purchased as portables, the bulk of these machines became de facto desktop units.

A new category of micros has formed recently and contains products much more worthy of the term "portable." Included are such machines as Hewlett-Packard Co.'s Portable 110, Grid Systems Corp.'s Compass and the Data General Corp. One at the high end and Radio Shack Corp.'s TRS-80 Model 100 and Convergent Technologies, Inc.'s Workslate at the low end. These machines generally weigh less than 10 pounds and can be carried in a standard-size briefcase. Despite some current shortcomings, this class of micros will grow into the portables of the future.

The debate over what characteristics must be present in a successful office workstation has gone on for years. Some advocates have been uncompromising in their demands for the perfect workstation. Others take the position that a stand-alone personal computer, although not offering every bell and whistle possible on a full-blown OA system, might be sufficient for the needs of many users. The lesson to be learned is that the workstation should be utilitarian and acceptable, both individually and collectively, to the users it serves.

The way micros have been accepted and utilized over the past few years has a lot to do with users' attitudes, which usually fall between two extremes. Some users (especially those who had no say in the purchase of their workstations) view their workstations as cogs in the corporate wheel. They react to the machine as if it were a standard company-issued piece of equipment, much like a telephone. It has set operational procedures and those procedures produce a standard result. To these users, the purpose of their machine is to enter data, process it and produce an output.

Other users have a different view of the machine's role. They more often consider it a personal productivity appliance. They use this machine as a tool that provides them with information to support a decision. The process of the input and output of information takes a back seat to the decision support aspect.

Users of portables generally fall into the latter category. The purchasing decision frequently lies with the individual; many portables (especially the new crop) are purchased as personal property. The portability aspect creates a bond between person and machine which is not so frequently found with desktop users.

One executive I recently met is representative of a growing number of new users: "My company bought a number of XYZ PCs last year for all our middle managers," she said. "I learned the basics and it helped me with a few jobs. But, this new portable has done twice the work for less than half the price. I still use the XYZ for big jobs, but the portable is capable of performing at least 85% of my applications. Also, I'm not afraid to depend on the PC, because it can go where I go. It's now easy to take my work home, rather than working late in a deserted office to meet a deadline."

Regardless of attitude, some basic considerations should be part of a decision on which workstation is best for a given user or situation. In considering which hardware/software combination will become the workstation of choice, the user and/or company must answer several basic questions:

- ***What applications are really needed?*** The applications should be, of course, the primary consideration in choosing any workstation product. But the applications must be prioritized. Chances are, there will be some tradeoffs requiring a clear delineation between what's essential and what would be nice to have.
- ***What level of compatibility with other machines is required?*** If files are to be used by other staff members, care must be taken to ensure that they can be accessed on the other machines. Many users, even those who consider these potential incompatibilities, prefer to live with incompatible machines rather than accept second best. A decision must be made about whether the portable will be the user's only workstation or whether it will defer to a desktop in the office.
- ***What level of communication with outside data bases is required?*** Data communications capabilities on portables are every bit as complex as desktop micros. It is realistic to expect that a large number of users will have no need that exceeds the terminal emulator capability offered standard on many of the new crop of portables.
- ***How important is upgradability?*** This is somewhat of a crystal ball question, but is nevertheless important. Accurately predicting at least the next few years can save a lot of money and trouble.
- ***Cost.*** Just like cars, workstations come in luxury and economy models. A clear understanding of how much the user is willing to pay must be present at the outset.

An evaluation of their workstation potential will show that compromises made to reduce the size and weight of portables sometimes translate into user limitations. The most obvious shortcoming is screen size and type.

The typical portable screen is an integral liquid crystal display, similar to those found on many watches. It is seldom larger than 14 lines by 80 characters — a severe limitation in applications such as spreadsheets, where viewing a large area is crucial. Although the user has the benefit of full software functionality — he can access any cell using cursor keys or GOTO commands — the interpretation of data suffers because the spreadsheet cannot be seen as a whole. Those who use spreadsheets frequently or whose spreadsheets are complex are likely to find this limitation overwhelming. And, needless to say, anything more than the most simple graphics are ineffective.

Some machines offer read-only memory chips that contain popular software packages. This concept makes portables much more attractive as workstations because it increases the software options without substantially increasing physical size or weight.

On the other hand, applications such as simple word processing and personal data bases are not significantly inhibited by the screen size. Many users report no particular problem with these applications. In fact, the quality of their written documents often improves because they are free to edit or add to them at any time.

Keyboard type and layout can also be limitations in applications that require substantial data entry — most commonly in WP. This drawback is most apparent on Convergent Technologies' Workslate, which has round buttons for alphanumeric keys. Just as the shape of those keys can slow down input and increase errors, conventional keyboards with tightly packed and badly placed keys can inhibit efficient keyboarding.

Specifications for lightweight portables are very diverse. The virtues and vices of each must be weighed individually, but a few general comments can be made. Mass storage techniques are very important in portables. Many low-end machines have only a microcassette tape; high-end machines like the Grid Compass have advanced nonvolatile bubble memory. The spectrum is very wide.

Some machines offer read-only memory (ROM) chips that contain popular software packages. Purchasers of the Hewlett-Packard 110, for example, can use Lotus Development Corp.'s 1-2-3 (spreadsheet), H-P Memomaker (limited function WP) and a terminal emulator, all from integral ROM chips. Grid Systems Corp. now offers on its Compass II model external ROM software that can be changed at will by the user. Many other vendors are also committed to the ROM software concept, and a number of such enhancements and new product announcements are expected early next year.

This ROM software concept makes portables much more attractive as workstations by increasing the software options without substantially increasing the physical size or weight. As ROM software becomes more widespread on portables, their numbers can be expected to increase dramatically.

The merits and limitations of portable computer hardware can be the source of many debates. Nevertheless, the most important topic is that they *are* portable — their shortcomings are tradeoffs. Portables can, after all, go anywhere from the friendly skies to a hostile boardroom. They can frequently be cost-justified solely on the value of time previously wasted but now productive.

Portables and desktops are not mutually exclusive. A growing number of companies, recognizing the need for portability, have acquired a limited number of compatible machines to be shared among users on an ad hoc basis. This is not an optimal situation; users won't use the portable for permanent tasks like personal data bases. It does, however, lay the groundwork for later acquisitions and affords users valuable hands-on experience without their having to actually purchase the machine.

An evaluation of the portable as a workstation leads back to an age-old concept. The primary consideration of the carpenter who buys an electric saw is not whether it is attractive, runs quietly or comes with a two-year guarantee. It is not even the saw that he is ultimately buying — it's the ability to cut wood. In much the same way, companies and individuals don't buy computers because they're computers. They buy them because of the productivity gains they can achieve through their use. How well the portable computer and its user interact to enhance productivity is the ultimate test of its success as a workstation. **OA**

Formerly a consultant with the Office Systems Consulting Group, Inc., Vogel has recently joined the staff of Gray Strayton International, a Wellesley, Mass.-based marketing communications firm.

GRAPHICS POUR INTO THE OFFICE

BY JEFFREY COGEN

The oft-heard remark, "Show, don't tell," can apply to many forms of business communication. Why choose words when a picture can tell the story better and quicker?

In the office, the influx of personal computers has brought with it the ability to make quick and efficient pictures with an ever-growing supply of integrated and dedicated graphics software. Once considered an unnecessary frill, graphics are quickly being accepted as standard fare in business communication.

According to industry watchers, this acceptance will fuel some staggering growth rates. Most predict that the growth of business graphics hardware and software will range from 30% to 40% annually. Carl Machover, president of the White Plains, N.Y.-based Machover Associates, predicts that sales of business graphics hardware and software will reach $6 billion in 1990, up from $500 million in 1982. According to International Data Corp. (IDC) of Framingham, Mass., the number of microcomputers used for some sort of business graphics will grow, in the next two years alone, from 400,000 to more than 2 million.

Why the unbridled enthusiasm? Graphics have often been overlooked, either because of the time it takes to create a graph manually or because of the cost and turnaround time involved when the job is turned over to an in-house art department or an independent service. Microcomputers have removed these obstacles. Personal computers have automated chart production, and managers are discovering that, with a few relatively inexpensive additions, the micro they bought for spreadsheets can produce graphics. Innovative products such as Apple Computer, Inc.'s Lisa and Macintosh, equipped with high-resolution, bit-mapped displays and graphics software like Lisa Draw and Mac-

paint, have spurred both the industry and end users to take another look at the possibilities of graphics.

Micros, however, are not the only reason for the interest in graphics. The lower cost and higher quality of today's graphics monitors, pen plotters, laser printers and other output devices such as 35mm slide makers make high-quality graphics an affordable option. In fact, many large companies already consider graphics a must-have tool for managers.

More managers have the option of using graphics because "more office equipment is sold with graphics capabilities as a standard feature," according to Maxwell Steinhardt, vice-president of information systems at Strategic, Inc. of Cupertino, Calif. Graphics are becoming a sought-after feature on any office system, and most vendors are obliging.

Business graphics is a catch-all phrase encompassing bar, pie, line, flow, area, scatter and text charts, along with maps and other illustrations. These images can be viewed on a computer monitor or output as overhead transparencies, 35mm slides, video or hard copy.

Managers who make frequent presentations are among those who have long recognized the value of having computer systems produce presentation-quality graphics. Recognition of computer-generated graphics as a powerful tool for decision making, however, has lagged behind. What the vendors and analysts are saying is that graphic information enables a manager to make better decisions quicker.

"Many studies have shown that it is a lot easier to understand a graph or chart than a table of numbers," said Deborah Kelly, manager of computer graphics research at IDC. "You can understand a lot more information, a lot quicker if you can see it in a graph. Even if you don't make any presentations, it can be a very helpful tool," she added.

For busy managers, graphs may be more than helpful. "Graphics are essential in making the best decision," according to Kathryn Alesandrini, president of Microconnect, a Santa Monica, Calif., graphics consulting firm.

Up until a few years ago, color graphics terminals cost about $20,000. Few microcomputer graphics software packages were on the market and, in fact, relatively few micros were found in businesses. The mainframe computer graphics programs, in general, were far from hospitable to non-data processing managers. For decision support, where the manager wants to see something quickly and then experiment with different what-if situations, there were noncomputerized options, but none especially quick and easy. "If you have to draw it out by hand or send it to an art department, you probably won't do it," Kelly said. IBM started a trend when it brought graphics to the masses with its introduction in 1979 of the low-cost 3279 color graphics terminal. The 3279 has since become the de facto standard for that capability. Other vendors followed suit, and the low-end color terminal market now ranges from $2,000 to $4,000.

While low-priced monochrome and color terminals brought graphics to those in mainframe environments, microcomputers brought graphics to smaller businesses and to the office desktop.

The lower cost and higher quality of today's graphics monitors, pen plotters, laser printers and other output devices make high-quality graphics an affordable option. In fact, many large companies already consider graphics a must-have tool for managers.

Increases in desktop memory have expanded the resolution of microcomputer graphic systems, encouraging vendors to beef up hardware and software graphics products for micros.

For example, IBM has recently added color graphics displays, expansion cards and graphics software for its line of Personal Computers. And with the 3270-PC/G and 3270 PC/GX workstations — graphically enhanced microcomputers targeted specifically for the mainframe environment — Big Blue is one of the few vendors to have addressed the question of mainframe data base access for graphics users. In addition, high-resolution bit-mapped displays are becoming more and more popular and have been a boon to computer graphics.

Following the lead of other microcomputer software packages, graphics packages have become increasingly user-friendly. More than 70 graphics packages, priced from $300 to $700, are now on the market. These include Business & Professional Software, Inc's BPS Business Graphics; Decision Resources, Inc.'s Chart-Master; and Graphic Communications, Inc.'s Graphwriter. Most are geared either to presentation graphics or to personal graphics for decision support.

Presentation graphics packages must offer many font styles, line widths and colors; they must also simply look good. Decision support graphics must be highly interactive for quick what-if games, but need not have all the output options.

General Mills, Inc. in Minneapolis, Minn., started implementing a graphics decision support system for plant productivity this year and is still looking for some of the tools, according to Ronald Miller, graphics support specialist. "No one package out there really stands out," he said. About half of the company's micros have graphics capabilities using both microcomputer and mainframe software.

Although there may be no runaway leader in terms of quality in the microcomputer graphics software market, in terms of quantity the race is not even close. Integrated packages with graphics introduced many users to graphics, and they still play a big part in the market. The ease of transferring data from a spreadsheet into a chart, and the convenience and low price of having it all integrated makes Lotus Development Corp.'s 1-2-3 and Ashton-Tate's Framework among the most popular programs that produce graphics.

Whether these packages are considered true graphics packages is another story. "Lotus' graphics capabilities are so limited as to be almost negligible," said Tom Treffinger, assistant editor of Datapro Research Corp.'s Datapro Reports on Microcomputers, based in Delran, N.J. No one, however, disputes that much of the business world uses 1-2-3 to make graphs.

"1-2-3 cuts into the sales for stand-alone packages," said Marilyn Darling, manager of product marketing at Business & Professional Software in Cambridge, Mass. "If Lotus satisfies 80% of a user's needs, he isn't likely to go out and buy a stand-alone graphics package for a few hundred dollars," she added.

According to IDC's Kelly, 1-2-3 is important in the market, not as a full-featured graphics package but because it "serves to whet people's appetites." She said many users discover personal computer graphics through Lotus' 1-2-3 and then move on to specialized packages with more advanced features.

The market is still far from mature. According to IDC, only 14% of the personal computers in businesses produce business graphics. IDC expects this percentage to top 50% by the end of the decade, fueled in large part by sales of specialized business graphics packages.

Although some industry watchers predict more packages integrating decision support and presentation graphics, Deborah Barlow, director of marketing communications at Graphic Communications, Inc. in Waltham, Mass., is not one of them. This is not likely, Barlow said, because "people need both analysis and presentation graphics. You won't expect that in one package; it would be too cumbersome to use. The answer is to integrate on the systems level instead of the application level, so that you can use the specialized packages you like best."

Myriad output devices have also decreased in price, furthering the allure of graphics for businesses. The price of laser printers plummeted from $30,000 to $10,000 in the last year, according to Alan Paller, who is president of AUI Data Graphics in Washington, D.C., and is on the board of directors of the San Diego-based Integrated Software Systems Corp. (a mainframe graphics software vendor). That price drop is overshadowed, however, by the reduction in the time a laser printer takes to print a black-and-white chart: five to 10 seconds compared with the three to five minutes needed by other printers.

Although laser printers do not print color, they do print pages containing both text and graphics. For growing numbers of companies that will produce a large number of documents integrating both text and graphics, "laser printers will take a little of the edge off color," Paller said. "People will make a lot of black-and-white charts because it is faster."

For companies that cannot afford or do not need laser printers, or for those that want color output, there are color ink jet printers and color plotters. Both print only graphics, but do so for $1,000 or less.

According to Steinhardt, the standard dot matrix printer has been extremely successful at the low end of the market. "It will continue to be a major source of output for people who want to merge black-and-white graphics and text at low cost," he said.

For users that want color output in 35mm slide form, film recorders such as the $1,500 Polaroid Corp. Palette can copy images from a microcomputer monitor. When used with certain software packages, these products reportedly produce slides with two to four times the resolution of the monitor.

Some analysts say that, as more companies opt for using graphics software on micros linked in networks, turnkey systems and mainframes will be used less and less for business graphics. Others emphasize the implementation of transparent interfaces between mainframe resident graphics packages and personal computers. Paller said he expects to see Fortune 500 companies implement interfaces allowing micro-generated graphics to be transported up to the mainframe for enhancement and presentation-quality output.

According to Pailler, mainframe-based charting systems have sprung up in a number of large companies over the last two years, providing on-line decision support for executives.

"The technology is just arriving for decision support on an economical basis," Miller of General Mills said. "Before, it was quite expensive to do online activities." Miller predicted that as more information is made available to graphics users, the information will be used more frequently.

Northrop Corp. of Hawthorne, Calif., installed an interactive charting system a year ago for a vice-president of engineering and his staff of managers. According to Bradley Butcher, a graphics product specialist, the vice-president has access to about 200 charts, most updated weekly. Before the system was inplemented, hand-drawn charts were tacked to the walls of one room in the company. "The vice-president and his reporting managers can now go directly to the charts they want rather than scanning an entire wall," he said.

The vast majority of applications involve scheduling staff and resources. According to Butcher, charts provide "a better way to illustrate the parts and current status of a project. You get the big picture a lot quicker."

Some companies, such as the Hartford Insurance Group in Hartford, Conn., have begun to provide microcomputer-based graphics for certain applications not needing extensive data retrieval from mainframe files. This makes it easier for infrequent users to create their own charts.

The graphics stations in the firm's information centers consist of IBM Personal Computers or compatibles with Graphwriter and a Polaroid Palette. They are used primarily for presentation graphics that require input of information by a clerical worker after a manager decides which data and graph style to use, said Phil Archambeault, of the Hartford Group. All the decisions can be made on paper, making the actual production of the graph a clerical job.

The price of laser printers plummeted from $30,000 to $10,000 in the last year. That price drop is overshadowed, however, by the reduction in the time a laser printer takes to print a black-and-white chart: five to 10 seconds compared with the three to five minutes needed by other printers.

The firm's mainframe system is used primarily for decision support. "We have a definite place for both," Archambeault said.

Although computer graphics will surely be used more frequently and more creatively in the future, the trend of using graphics for decision support will have the greatest impact on business. Said Kelly of IDC, "I can't see that not happening." OA

Integrated text and graphics.

Word processing.

Electronic mail.

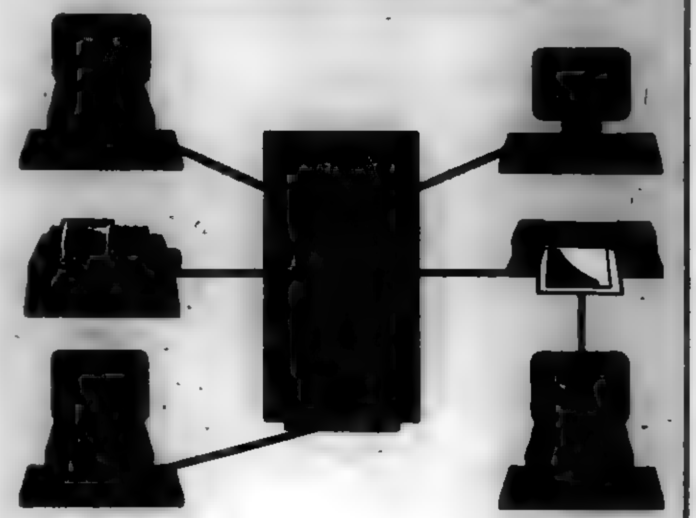
Beyond OA: the Person

To stay ahead, your business needs more than office automation. It needs business graphics, communications, word processing, personal computing *and* data processing working together in one simple system.

Our Personal Productivity Center is the single solution for both the office automation and data processing sides of your company. Built around the powerful HP 3000 computer family, it integrates the information your people need to work more productively.

The HP 3000 provides an interface for a wide variety of workstations, peripherals and personal computers, including our Touchscreen Personal Computer and The Portable, as well as IBM PCs. That way, you can use the built-in capabilities of the personal computer and also interact with the powerful HP 3000, without having to learn DP commands.

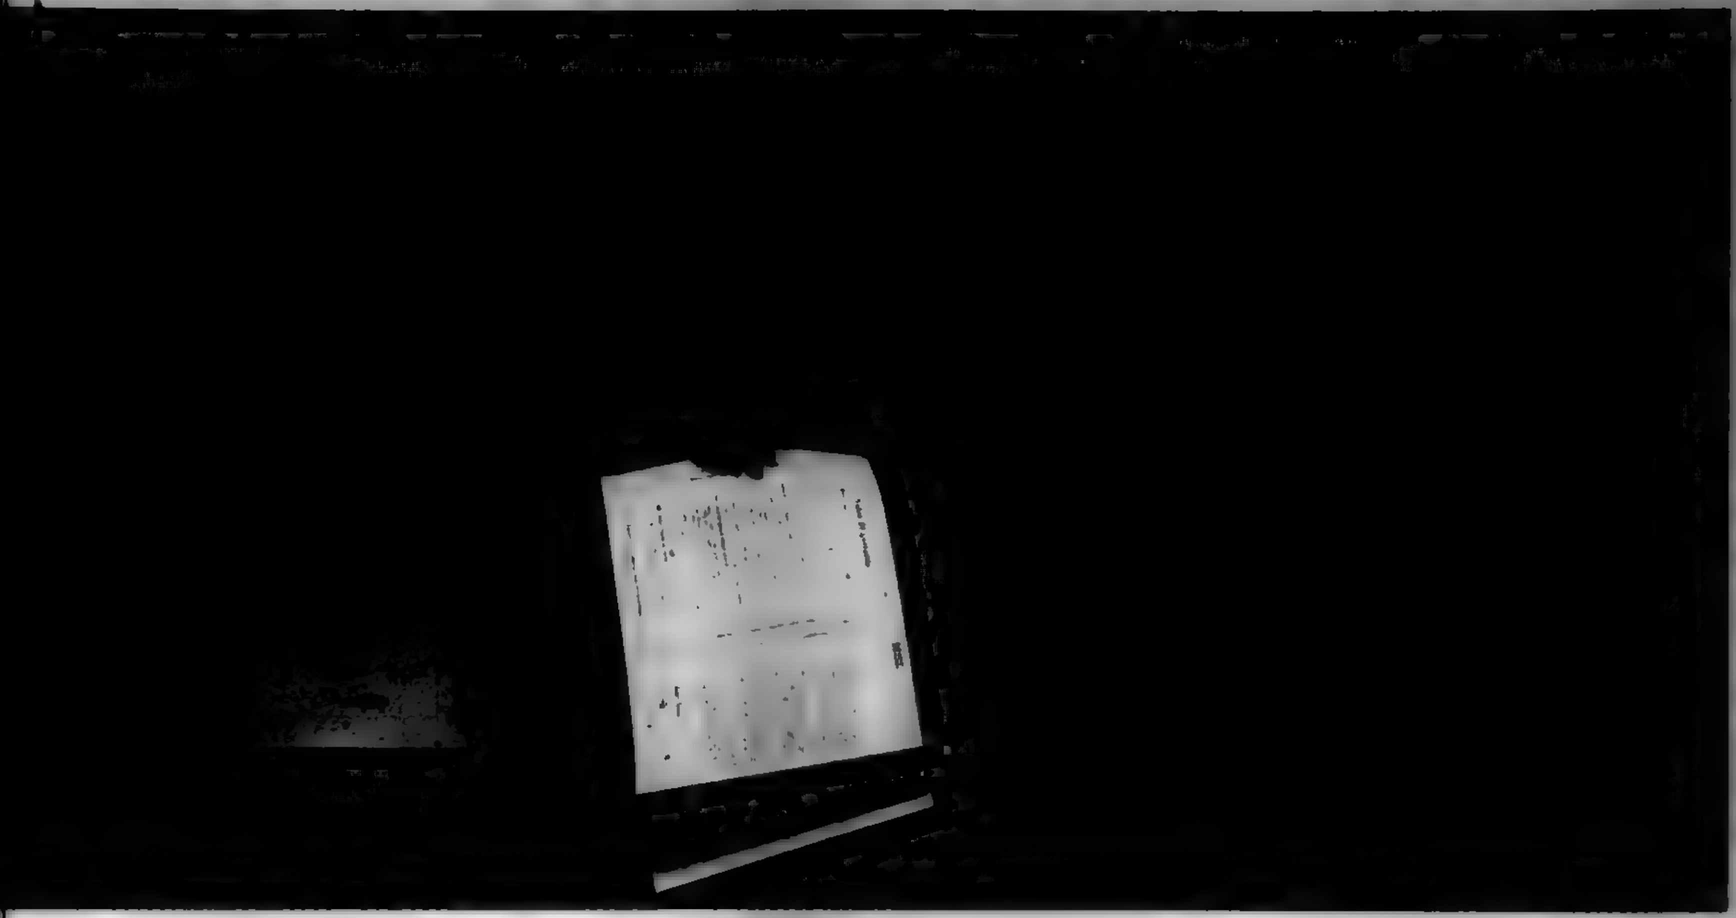
A typical Personal Productivity Center.



Driven by an HP 3000 Business Computer, it integrates the information needs of the modern office. A single Center can grow to connect as many as 400 users.

You can do word processing, report writing, business graphics, spread sheet analysis, and all the other functions of office automation. You can send electronic mail and integrate text with graphics. Then, on the same system, handle data entry and retrieval, data base management, even accounts payable and general ledger.

The Personal Productivity Centers can



Presentation graphics. Mainframe data access. Even The Portable, to go.

al Productivity Center.

change and grow with you right up the line, because the HP 3000 family's compatibility makes it easy to upgrade and add new systems. Without recompiling, or any software conversion at all.

Interconnecting these systems is simple, too, thanks to HP AdvanceNet. The Centers themselves are joined in an office network. Then, the HP 3000 computers can be linked with systems in other buildings, or at the other end of the earth. As well as with your mainframes.

To keep everything working smoothly together, we offer worldwide support that was rated #1 in a Datapro poll. Our wide range of services can be closely matched to your needs and budget.

And the best news is that Personal Productivity Centers provide a very economical way of doing business. So if you want one system to raise productivity, instead of two, call your local HP office listed in the white pages. Ask for a demonstration of the Personal Productivity Center. Or write for complete information to Susan Curtis, Hewlett-Packard, Dept. 003204, 19055 Pruneridge Ave., Bldg. 46T, Cupertino, CA 95014. In Europe, write Michael Zandwijken, Hewlett-Packard, Dept. 003204, P. O. Box 529, 1180 AM Amstelveen, The Netherlands.

You'll see why the most productive business is a united one.

Productivity. Not promises.

Information Centers: Solution or Problem? 37

DECISION SUPPORT SYSTEMS

BY LEONARD P. BERGSTROM

Forces currently at work within the information processing industry are posing tremendous challenges to both users and vendors of decision support systems (DSS) products and services.

One of these forces is the advent of the information revolution. Another is the growing trend toward computer literacy and acceptance. Together, these two forces have created a dynamic and expanding marketplace, accompanied by extraordinary demands made by end users on suppliers. At the same time, the relentless march of technology continually offers better and less expensive solutions in the areas of hardware, software and communications.

These rapidly evolving factors have profoundly influenced all sections of the industry. They have also helped create a major opportunity — not only for firms in the computer business, but also for the individuals responsible for the delivery of information services within corporations.

Vendors and authors of DSS products have been particularly affected by all this movement. All face the need to effect a quick transition in order to capitalize on the opportunities available and fulfill an expanding list of requirements. Proper resources must be directed in delivering software and services which not only meet current and latent demands, but which also integrate evolving technologies and prepare for future challenges.

This situation has led to an extremely competitive environment, characterized by a diversity of approaches, many instances of product overlap and an increasing number of cooperative "arrangements" between companies.

To understand DSS software trends, one must understand three industry forces — the demand for information, the increasing computer literacy and acceptance and the need for integration. End users are basically concerned with three types of information: private (owned and controlled by the individual or department); corporate (historically owned and controlled by DP); and public data bases (such as financial, econometric or demographic sources).

Of particular importance to the end user is the window to the corporate data warehouse. In today's business world, information is a valuable corporate resource, and its access is a critical ingredient to corporate survival and success. The DP organization can no longer regard corporate data as something removed from the everyday world, locked away in Cobol programs. Instead, DP must take an active role in making corporate data available to the broad range of managers throughout the corporation and encouraging the use of this information in as many ways as possible.

Accessing external and corporate information has been a major activity area for many DSS vendors. Software must provide either direct access to summary and aggregate data residing in production systems or must closely interface to data base management packages like Information Builders, Inc.'s Focus and Mathematica Products Group Inc.'s Ramis II, traditionally the gateway to corporate information resources.

Similarly, in the external data base arena, many software products support a wide variety of offerings. Two good examples are marketing and econometric information. Analect (OR/MS Dialogue, Inc.), Express (Management Decision Systems, Inc.) and Stratagem (Integrated Planning, Inc.) all support Sami, Nielsen and Majers data, used in market research and analysis departments in the consumer goods industry. In the econometric area, Fame (Citicorp Information Services) directly accesses Citibase, and Xsim (Chase Decision Systems) supports Chase Econometrics.

DP must take an active role in making corporate data available to the broad range of managers and encouraging the use of this information in as many ways as possible.

One of the interesting trends in software on the information center level is the blurring of the traditional distinction between financial and data management systems. In our benchmark-based reports, *Financial Modeling Decisions* and *Data Management Decisions*, more and more products qualify as able to handle the different problem sets necessary to be included in both publications. Until recently, few products could successfully complete entries for both these reports. Currently, Analect, Express, Nomad 2 (D&B Computing, Inc.) and SAS (SAS Institute, Inc.) are represented in each published report. A number of others will soon be completed, including AS (IBM Information Network), EMS (Economic Sciences Corp.), FCS-EPS (EPS, Inc.), Interactive Financial Planning System (IFPS from Execucom Corp.) and System W (Comshare, Inc.).

More of the financially based systems seem to be adding stronger data management capabilities than not. Data management has traditionally been one of the weakest aspects of DSS systems. To shore up this deficiency, DSS products have appeared with integrated multidimensional data

How to avoid the document conversion trap.

Now, in just minutes, you can convert a full diskette *without losing headers, footers, tabs, underlines or any other formatting codes.*

And without cleanup.

Announcing the KEYWORD 7000. A revolutionary new breakthrough in document conversion.

It's finally happened. Keyword has discovered the key to document conversion. Now documents can be transferred to and from all major office automation systems in letter perfect order. *Automatically.*

What's more, simple on-screen prompts and a special "HELP" feature key make the KEYWORD 7000 extremely easy to operate. In fact, even a beginner can learn to use the 7000 in minutes.

Plus, the KEYWORD 7000 costs just pennies a page, compared to service bureaus at $3 a page. Or rekeying at about $4.50 per page.

But that's just the beginning. To find out more about how the KEYWORD 7000 can help you avoid the conversion trap, call 1-800-227-1817 (ext. 801F) and get your free booklet: *How to Win the Compatibility Battle. Exciting New Facts about Today's Office Automation Compatibility Solutions.* Or fill in—or attach your business card to—the tear-off coupon. And mail it to the address below.

Call 1-800-227-1817 (ext. 801F)

They're so smart they program their operators.

New Kodak Reliant
intelligent
microfilmer 2000

New Kodak IMT-250
microimage terminal

New Kodak Reliant intelligent microfilmer 2000 and IMT-250 microimage terminal.

Here's document capture and retrieval ability so comprehensive it actually directs, guides, and self-corrects the work of the operators.

The Kodak Whiz Kids possess so much built-in microprocessor power, they automate most of the functions once performed manually by the operator.

They monitor themselves continuously. Communicate with each other. Stop if something is wrong. They tell the operator in plain English what went wrong, and how, to correct it.

Our new Kodak Reliant intelligent microfilmer 2000 and IMT-250 terminal are the fastest, smartest, most accurate image management machines we've ever made.

We think they could help you file and find documents with ease and speed you never dreamed possible. If you think so too, mail the coupon.

Kodak's fastest and smartest.

bases; others have developed hierarchical consolidation systems or interfaces to relational data base management systems. Three products have modified the public domain version of RIM to beef up capabilities in the information management sector.

Understanding the increasing computer literacy and acceptance is another key to meeting the challenge of the fu- More and more business schools are requiring students to purchase a personal computer before admission. This literacy does not imply that all current executives will buy a micro, roll up their sleeves and begin programming. It does indicate that decision makers will have a better understanding of the current technology and what can be accomplished with it.

By accepting automation, members of the new generation of managers are increasing their own productivity, as well as contributing to the overall use of automation in the work place. This growth has caused coincident booms in microprocessing, spurred the need for sophisticated communications and established the information center as an integral part of corporate structures.

With the advent of the 16-bit micro with its larger addressable memory size and the plummeting cost of peripheral storage, more DSS authors are developing micro versions of their products. Although a few vendors still employ the ostrich approach to personal computing, this attitude is rare. Microcomputer software is a hot button in the industry today. Minimally, an interface must exist to popular or existing products.

Although the vast majority of DSS software vendors have jumped on the distributed bandwagon, the approaches, styles, capabilities, delivery and pricing vary as much as those of the mainframe versions. These products can be grouped into two general categories: subset and full versions of mainframe functionality. The list of these products is much too long to cover in detail; but several examples will highlight general capabilities and common concerns.

One philosophy utilizes the personal computer for the functions for which it is best suited: modeling, reporting, information maintenance and so on. Boeing Computer Services Co. embodies this philosophy in the EIS micro workstation, which provides mainframe communication and emulation of EIS full-screen capabilities, local data collection and modification, 3279-style color graphics and links to popular Calc products. On the IBM PC, the predominant delivery vehicle in the arena today, the user can operate either on-line or locally and is freely allowed to switch back and forth between the two modes.

Many leading DSS vendors offer subset versions of their products. These include several of the more well-known industry names as Execucom Systems Corp. (IFPS/Personal), Comshare, Inc. (Micro W), EPS, Inc. (Micro FCS) and Xerox Computer Services (Control). Generally, all two-dimensional capabilities are found in the micro version, leaving the mainframe environment for more complex tasks like hierarchy consolidation or activities requiring heavy I/O or data management needs such as risk analysis. One author, Lloyd Bush, has four separate micro-based offerings, the top end of the line very similar to the mainframe version.

Among the other software vendors that have implemented micro versions with 100% capability are the following: Command/DSS (Decision Support Systems, Inc.); CPL/Tactix (Mercur Planeringssprak); FPS/PC (STSC, Inc.); Maps/Pro (Ross Systems, Inc.); Micro Foresight (Information Systems of America, Inc.); Micro Impact (MDCR, Inc.); Prophit II (Via Computer, Inc.); and Spread (L & L Products, Inc.).

All these products offer built-in communications, and the vast majority take advantage of the screen-oriented features of the microcomputer and its strength in the area of user interface. Other trends that emerge in the field are the inclusion of the Visi-like capabilities (such as the statement, "the equivalent of any Calc product"), the use of C or Pascal as the underlying development language and aggressive volume discount policies. It is worth noting that another stand-alone micro product, Encore by Ferox Microsystems, Inc. actively interfaces to the most popular mainframe offerings.

These developments offer real hope for the manager of corporate in-house time-sharing services in providing distributed DSS while solving some of the control, planning and support problems engendered by the rapid proliferation of microcomputers in departmental and other end users' hands.

The availability of compatible microcomputer and mainframe DSS products with built-in communications will satisfy the decentralized, stand-alone user. In addition, a pattern of growth is available when applications expand beyond initial expectations; require the networking of data, models or reports; and demand the processing capabilities and sophistication of the mainframe.

One of the most pressing concerns of DSS users is integration, and this subject poses challenges to suppliers on several levels. The needs vary relative to hardware, software and end-user viewpoints. In the hardware area, numerous decision support centers are faced with the problem of interfacing micro, mini and mainframe software, many times involving diverse operating systems and manufacturers. Some DSS products run on multiple environments or, in the IBM arena, with compatible VM and MVS versions. This flexibility in delivery systems is especially important to large organizations with multiple decision support center offerings.
